Life of the Farm Loan System Threatened

The interests of the farmer and of every man the farmer feeds are being threatened by powers which seek to control both the producer and the consumer. The extent of the attack and the possibilities of its success are discussed in this article.

Shackling the Flood Devils of the Miami

Ever since the glaciers invaded Ohio and gouged out the Miami Valley, that part of the country has been at the mercy of destructive floods. Now man is engaged in a struggle with nature to determine whether this evil shall continue and the result is the greatest flood prevention project ever attempted in this nation.

Why the Jews Dislike the Morgenthau Report

A Quarter of a Million Polish Jews are entering the United States. You have read yards of Jewish newspaper propaganda about Polish "Persecution." Did you ever read what an American Jew, sent by President Wilson, has to say about it? Probably not—Because the Jews don't want you to.

When an American Woman Can't Vote

An interesting and informative article dealing with the experiences of a Daughter of the American Revolution who discovered that under the confusing laws of citizenship she had been deprived of her right to the ballot.

The Man Who Made Harold Bell Wright

How the "Dickens of the Rural Route" rose from an itinerate pastor of the Ozarks to a place among the most popular American authors. Though critics laugh at and profess to scorn his writings, his books sell by the millions.

583202

Many Men of Many Minds

Gifford Pinchot.—The people of the United States are the most wasteful in the world—wasteful in living, wasteful in manufacturing, and wasteful in their failure to conserve our national resources.

Dr. Charles P. Steinmetz.—If all our potential water powers were developed and every raindrop used, it would not supply our present energy demand.

Mr. Thomas W. Lamont, financier.—The Military party in Japan believes in a mighty army and navy. Japan is commercially, today, under a handicap which I should hardly attempt to analyze if it had not been done for me by the Japanese themselves. This handicap is the policy of the so-called Military party, which of recent years has been so strong as almost to constitute an actual super-government.

Boris Brasol, former district attorney of Petrograd.—The Bolsheviki have tried to convert the peasants into staunch believers in communistic ideals. They have endeavored to convince the peasant that he ought to give up his land but the property-owning instinct is something which the Bolsheviki simply cannot subdue. Much in the same way they are unable to compel the peasant to surrender the surplus crops to feed their Red gangs in the cities. The peasant contends that there is no need of producing more than he himself is able to consume since industrial production has ceased entirely and he can obtain nothing in exchange for his surplus.

Russian Peasant Refuses to Surrender Land

Rev. Dr. Anson Phelps Stokes, secretary of Yale University.—Education of a type adapted to the special needs and conditions of a given people is absolutely essential if that people is to be raised to a higher level of civilization. Nothing has struck me more in my recent travels than the determination of the forward-looking nations to try to fit their backward races through education for as large a measure of self-government as their capacities warrant.

H. G. Wells.—The abolition of war is no casting off of ancient, barbaric, and now obsolete traditions, no easy and natural progressive step. The abolition of war, if it can be brought about, will be a reversal not only of the general method of human life hitherto but of the general method of nature—the method, that is, of conflict and survival. It will be a new phase in the history of life, and not simply an incident in the history of man.

John Skelton Williams, Comptroller of the Currency.—Excessive interest rates offered in New York artificially draw money away from outside communities through their banks and often leave legitimate enterprises starved or pinched.

Dr. Marion LeRoy Burton.—Socially, we have achieved results worthy of our democratic aims. We have no actual class distinctions. Men and women of ability are freely given the chance to pass from one group to another. Leisure classes are rapidly becoming extinct. Respectability no longer attaches to social parasites.

Ernest P. Bicknell, Red Cross deputy commissioner.—Taken as a whole, Europe has made marked progress toward recovery from the effects of the war in the twenty-two months since the armistice. There have been periods of depression in every country, during which the gravest fears for the future were entertained, and in which little progress was made. A new spirit has taken hold of the western nations during comparatively recent months, and, barring a serious setback in the immediate future, their progress toward complete rehabilitation from this time forward should be rapid.

Red Cross Official Believes Europe Shows Gain

Honorable Arthur Meighen. Premier of Canada.—Every citizen who has the energy and ambition should have a chance to earn and receive adequate compensation for services rendered. Do not forget as well that, after compensation exceeds the value of services rendered, a stagnation of industry and unemployment are bound to follow.

Luis Carlos Portillo, consul general of Mexico.—A decade such as Mexico has suffered naturally has put the country back a great deal in development, and we cannot expect to overcome this setback, or repair the ravages of revolution in a day, or in a year, but, given time, Mexico will be as quiet, as hard at work and as prosperous as any country of its size in the world.

Sherman Rogers, editor.—Bolshevism has spread in the state of Washington.

Rev. Dr. Thomas F. Gailor, Episcopal bishop, of Tennessee.—We have inherited some unfortunate prejudices. We have had too much aristocracy in our traditions. We are too horribly respectable. Our ancestors left us traditions of state's rights. Well, the country had a fight for four years over that subject, and, so far as the country goes, it was settled for all time. But we never have had a fight in the Protestant Episcopal Church over this matter of rights, and, as it never has been settled, we have been lumbering along burdened by state's rights, diocesan rights and the independent bishop.

Baron Hayashi, Japanese ambassador to Great Britain.—War, even if successful in a military way, is not a paying proposition nowadays.

G. K. Chesterton.—The Socialists often demand real rights; they most certainly denounce real wrongs; but it is very difficult to get them to deal in any words so simple as right and wrong. It is only when they have called the workman a proletarian that they will consent to become conscious of his existence at all. They are dealing with great popular and unpopular realities that are as plain as poison and blood and beer. But they always dilute these definite things with watery floods of indefinite.

Mrs. Carrie Chapman Catt.—If the vote had been granted to women some 25 years ago, women's influence would have so leavened world politics there would have been no war.

Isaura Gabaldon, Philippine commissioner.—I wish to be careful to emphasize that the Filipino people have very friendly feelings toward the United States. We realize more than anyone else that you have rendered us a great service in assisting us to prepare ourselves to take over the responsibilities that will come with independence. We are practically unanimous, however, in desiring a Philippine republic, and we desire it for precisely the same reasons that you Americans desire a republic.

Wayne B. Wheeler, general counsel, Anti-Saloon League.—Prohibition is not a failure. It is going through the same experience that state and local prohibition laws were subjected to in many places. Of course, the law is not very well enforced in some places because some public officials are derelict in duty and others are corrupt. The league will keep on guard. If we could win the fight with the odds all against us, we can hold the fort when the enemy is outside.

Anti-Saloon League to Stand Guard on 18th Amendment

George Creel.—The United States has sent some 14 notes to Mexico on the oil question. The attitude of this government has not varied in any particular from the time of sending the first note in 1916 to the present time. All we demanded then and all we demand now is the protection of American lives, rights and property, such as is accorded to foreigners in every civilized country of the world.

James A. Davis, Chicago Association of Commerce.—No richer harvest was ever offered to the fake stock-jobber than that of the present time. It is safe to estimate that at this very moment there are more than $1,000,000,000 worth of wildcat "investments" being offered to the public in this country. The United States leads the remainder of the world combined in the amount of money lost annually in financial swindles. States which do not have blue sky laws, notably New York State, are in the lead in the number of shady stock flotations. In New York State alone there are $100,000,000 worth of securities being sold which we refused to qualify under the Illinois securities laws.

Viscount Grey.—The best I can suggest is to make it clear that the very starting point of our policy is our conviction of the incapacity of the British Parliament to manage purely Irish affairs, and our determination to put an end to this tragic failure. And I want to see it clear beyond power of misconception, that within certain limits, frankly and honestly stated by us, Irishmen are not only free to arrange their own government but must do so.

President de la Huerta, of Mexico.—Our one desire is to form part of the concert of civilized nations by respecting all established principles for the development of a free people. Mexican laws are not confiscatory, and I formally declare it has never been our intention to give them such an effect. Nothing is more untrue than the assertion that the Mexican Government has forcibly deprived foreigners of their property. Mexico will pay all it justly owes in conformity with all recognized principles of international law. The outside world should be satisfied with this solemn promise.

M. Clyde Kelly, Representative from Pennsylvania.—One of the difficulties encountered in plans to stimulate building has been the unwillingness of private banks to lend money to home builders at low rates, it is said, because they can receive greater interest by lending to speculators.

Miss Mabel Boardman.—Woman suffrage, whether we approve of it or not, is no longer an opinion, but a fact, and with suffrage will undoubtedly come the additional duty of civic responsibility and, to a certain degree, of official service.

Judge J. W. Woltz, Buffalo, New York.—Under prohibition a man brings home his entire pay envelope to his wife. He comes home good-natured, not half drunk and surly and he takes the wife and the babies out to the movies. The change in home conditions is very great, and is a matter for rejoicing.

William Jennings Bryan.—The world is weary of war. If blood is necessary for the remission of sins, enough has been spilled to atone for the wrong done by all who live upon the earth. If sorrow is necessary to repentance and reform, enough tears have been shed to wash away all the crimes of the past. This last plague would seem to have been sufficient to release the world from bondage to force—if so, mankind is ready to turn over a new leaf and set about the task of finding a way to prevent war. The work will be made easier by the fact that equal suffrage brings woman's conscience to the aid of man's judgment and thus hastens the triumph of every righteous cause.

Blood Enough Shed to Redeem All Sins, Says Commoner

Samuel Gompers.—In the American Trade Union, founded upon the democratic control of the rank and file, there is no power lodged anywhere to call a general strike in the United States.

E. W. Howe.—I have never been able to understand that writing men are the real intellectuals. I should say that the intellectuals are those who have the best common sense and apply it most usefully.

Sir Charles Addis.—You will be making a great mistake if you attach the importance of revolution, as naturally attached to revolutionary countries in Europe and in the West, to an Oriental country like China. These revolutions are bloodless revolutions. The Chinese, perhaps more than any other people, have a standard of rectitude, a deeply-rooted, innate belief that right is might, and that those reforms which are brought about by force are not likely to be permanent or salutary to the people.

John Burroughs.—No one else looks out upon the world so kindly and charitably as the pedestrian; no one else gives and takes so much from the country he passes through. Next to the laborer in the fields, the walker holds the closest relation to the soil; and he holds a closer and more vital relation to nature because he is freer and his mind more at leisure.

Samuel G. Blythe.—The average American is an awkward radical. He functions clumsily as a red, a pink, or even as a mere glow. Communism is as vague to his understanding as internationalism, and internationalism means the foreigners in a certain part of the city who are always getting into trouble with the police. Since the war he has learned the term "Bolshevism," but that ordinarily types uncut whiskers, low brows and exploding bombs to him. If he has any radical ideas he cloaks them by saying he is a progressive, which is a status from which he can work in either direction and which enables him to retain standing with neighbors.

Average American's Politics Not Even a Pale "Pink"

Vilhjalmur Stefansson, arctic explorer.—The time is surely coming when a very considerable part of the world's supply of meat will be raised on the grazing lands, within and around the Arctic Circle, and when settlements of people will find life not only endurable but congenial along the highways leading to the North Pole.

James Lord, labor investigator.—Mexico is today consuming an increasing quantity of American-made products and with the peaceful development of the country this consumption is certain to increase rapidly. Of course there are many conditions in Mexico that are far from ideal. It is no easy task to uproot the peonage system, and the removal of illiteracy presents a staggering problem. The important fact, however, is that progress is being made and that there is a sincere and intelligent effort to meet the needs of the people and to develop the marvelous resources of the country.

When an American Woman Can't Vote

By HELEN PUTNAM VAN SICKLEN

THIS is the story of the second time I became an American citizen. The first time was when I was born in Milwaukee; the second, when I was naturalized in San Francisco.

There were booths in all the department stores labeled: "Register Here"; "Women, Do Not Neglect Your Citizen's Duty." So one morning I stopped at the desk in the Emporium. The registrar began at once with pencil and blank. She asked my name, address, birthplace, politics; my husband's name, address, birthplace—right here the mayor-to-be lost one vote.

"Is your husband naturalized?"

"He has made declaration of intention to become so."

"Hm, Hm," she said thoughtfully, "I don't think you can vote, then. I'm afraid you have lost your citizenship."

"What!" I was somewhat startled. "Why can't I vote? I'm a native American citizen, a descendant of illustrious Americans who fought to make this country a country, and of others who later fought to keep it a United States. I, not a citizen of my own country? I—why I can't understand! And besides I've voted before," I ended lamely.

"Well, I think that the same law that conferred United States citizenship on me, deprives you of your citizenship. I was born in London, married an American and acquired his nationality. We had better not go on with the registration. I'll look into the matter at the city hall to make sure and phone you if you'll leave me your number."

I did. In a day or two she telephoned to tell me that our law made me, the American wife of a Canadian, a "Subject of King George!" "Any American woman who marries a foreigner shall take the nationality of her husband." Section 3, Act of Congress, March 2, 1907.

"But I haven't taken any Oath of Allegiance to Great Britain!"

"Neither have I to the United States," she answered. "It doesn't seem to be necessary in naturalization by marriage."

"Oh!"

Can you beat that? I was mad all through—yet I still had sense of humor enough left to think it screamingly funny—but nevertheless I was angry. Just plain angry. A descendant of a general of the American Revolution, a D. A. R. and a Subject of King George all in one! Whew! History studied in a New England primary school had left me no love for a former king of that name. In fact I have never quite recovered from a violent prejudice against England engendered in those early schooldays. I fairly hated the persecutors of the Pilgrims. And I hated still more becoming one of their nation. I really believe I could have stood with better grace being a French citizen or even an Italian or Dutch subject. But a subject of King George! Ugh! It's silly, I know—I would denounce anyone else for having the same feeling. Don't you think our public school history is at fault in this respect?

An Expatriated Patriot

EXPATRIATED! Involuntarily expatriated! Our laws on that subject are interesting. The old general doctrine was that "no person can, by any act of his own, without the consent of his government, put off his allegiance and become an alien." But times changed and in 1868 Congress declared that "Expatriation is the voluntary renunciation or abandonment of nationality or allegiance. The right of expatriation is a natural and inherent right of all people." In 1907 the modes of expatriation were defined also by Congress:

1. By naturalization in a foreign state.
2. By taking the oath of allegiance to a foreign state.
3. By residence of a naturalized citizen of the United States in a foreign state.
4. By desertion from the army or navy.
5. By marriage of an American woman to a foreigner.

Then follows this choice bit: "An American citizen shall not be allowed to expatriate himself when his country is at war." That ought to have let me remain an American. Or else someone should have dashed in and stopped my wedding crying, "Halt, she cannot expatriate herself! Her country is at war!" So far as naturalization is concerned, it seems we have still to prove that women are people. I wonder if there was any penalty I should have paid.

There was nothing for me to do, but wait till Will could become a citizen. I could not apply for naturalization myself, for these only are capable of being naturalized, if they can read and write and are of good moral character:

1. A free white person.
2. A person of African nativity or descent.
3. An American Indian, except a member of the five civilized tribes in Indian Territory (now a reservation in Oklahoma).

When Will became a citizen I'd be one—not before.

Queer laws—Mark Twain must have been more sad than merry when he said: "However, such is the human race. Often it does seem a pity that Noah and his party did not miss the boat."

Several months passed. The time came for Will to make his petition for naturalization. The whole thing was somewhat complicated because he had made the declaration in Texas. However, in due time, the California office notified the Texas office and their notary to take depositions from two citizens regarding Will's residence there. Well and good; but by that time his San Francisco witnesses here had moved away from the city, and it was not at all convenient for them to come to the superior court in the city for the hearing of Will's case. Week after week went by. Nothing was done. Will couldn't proceed without his witnesses. They couldn't come. I grew more and more weary of being an alien in this my native land.

Will was awfully busy. So I volunteered to go to the naturalization examiner's office to make arrangements for a substitution of witnesses. There I met a courteous gentleman who listened gravely to my request.

"Why can't they come?"

"They do not live in the city. It is inconvenient for them."

"Where are they?"

"Stanford University."

"Stanford University! What's that? An hour's ride. Inconvenient! Bah! It's anarchy! We'll subpoena them!"

He hadn't looked so turbulent. One simply can't subpoena one's friends. He talked at length on the subject of witnesses, "the most selfish people in the world." He told me of many witnesses in many other places who wouldn't drop everything else to help in this—the greatest work of all—the Americanizing of our foreign-born. We talked of women and marriage and citizenship.

"I understand that the suffragists are working to change that law."

"But they'll never succeed if I have any influence."

"Why?"

"Too much trouble has been caused the United States Government by American wives of aliens residing in foreign countries and seeking United States protection. A very complicated and bothersome source of trouble." He seemed very wise and learned in this, his own particular field, so I guessed we women were in for it; our husband's birthplace would regulate our nationality and allegiance.

Hunting for Witnesses

WE FOUND that we were both born in Milwaukee (a happy discovery). We had even more in common. We had both lived in the East and in the South, and knew many of the same places. We both loved Texas. I encouraged him to go on. He was happy to be able to say, without fear of contradiction from a native daughter, that he truly thought there were other states with charms quite equal to those of the Golden State. It's true that I'm a Californiac along with all the other Easterners and Westerners and "Subjects of King George" who claim this state as home. But it was a relief to get some of the pique against the whole naturalization system out of my own system by just listening to him criticize California.

I still intended to substitute witnesses, get Will naturalized, and become a citizen myself with no more delay. We went back to our starting point. He saw that we couldn't subpoena our friends. We would have to wait till they could come, or were too ill, or dead, or out of commuting distance. I expressed a hope that we could finish up before they went on their summer vacation.

"They are going away?" he asked.

"Yes, in a week or so."

He assumed out of the state. I didn't correct him. He would accept substitute witnesses when they had departed.

Will was frankly shocked. And still more shocked when I asked why I—expatriated through no crime and not of my own volition, and not eligible to regain my own nationality until death or divorce did us part—should hesitate to outwit a mere judge in an American court.

But Will, not I, was going before the court to swear to the truth, the whole truth, and nothing but the truth, and being of the stuff that makes good citizens, said "No." His no means no. So that ended that. After all we'd have to wait for the original witnesses!

However, I had made up my mind that I was going to vote for a President this November, and you know that a newly naturalized citizen can't vote for three months after citizenship is granted. Well, I went back to the examiner's office. I pretty nearly told him the truth. Mr. L., the witness, was not very well; chronic heart trouble, and was at his summer camp near by.

If the examiner had a sense of humor, there was no give-away twinkle in his eye when he gravely promised to accept that illness as a valid reason for the substitution. At last it was all settled. Before another week Mr. and Mrs. S. would come from Stanford to help naturalize us.

The Right of Citizenship

ANOTHER little chat with the examiner and a couple of books from his reference library revealed to me this history of the development of our naturalization laws regarding women. Looks as if we had grown backward.

"Naturalization is the act of adopting a foreigner and clothing him with the privileges of a citizen. A naturalized citizen becomes a member of society, possessing all the rights of the native citizen, and standing, in the view of the Constitution, on the footing of a native." (Since Will's naturalization, do you think that I am a native-born American citizen or a naturalized American citizen?)

Away back in Revolutionary days a certain Ann Shanks married a British officer and returned with him to England. Now for some reason or other the Supreme Court was called in and it declared that "marriage with an alien produces no dissolution of native allegiance of the wife. It may change her civil rights, but it does not affect her political rights or privileges. The general doctrine is that no person can, by any act of their own without the consent of the government, put off their allegiance and become aliens If it were otherwise, then a *femme alien* would by marriage become, ipso facto, a citizen, and would be dowable of the estate of her husband, which is clearly contrary to the law."

Along in 1839 our Supreme Court again handed out a decision that "a *femme covert* might be naturalized even against the consent of her husband."

It wasn't until 1855 that an alien woman acquired citizenship by marriage to an American. An Act of Congress on February 10 of that year states: "Any woman, married or who shall be married to a citizen of the United States, shall be deemed a citizen." Eleven years before, in 1844, Great Britain had passed precisely the same law, conferring citizenship on alien wives of British subjects. They went ahead of us then, and again in 1870 when a new Act of Parliament ruled that "a married woman shall be deemed a subject of the state of which her husband is for the time being a subject." We reached that stage in 1907 under Roosevelt. I'll get to that later.

Even now things didn't run smoothly for the State Department. Case after case was decided this way and that. For instance, in 1862 Attorney-General Bates held that Mrs. Preto's marriage to a Spanish subject in the United States and her later removal to Spain did not deprive her of her native citizenship. In 1877 Solicitor General Phillips decided that the marriage of Mrs. D'Ambrogia, an alien-born woman, to a naturalized citizen of the United States conferred on her "a permanent status of citizenship defeasible only as in the case of other persons," and further held that "her subsequent marriage with an alien did not affect this status." Then there was Mrs. Berthemy, born in France of American parents. She married a Frenchman and lived in France until his death. In 1866 Attorney-General Stanberry ruled that she was not a citizen of the United States. Yet nine years later, in 1875, it was uniformly held that a father's naturalization conferred the same privilege on his minor children. Now in the case of Campbell vs. Gordon, the child remained in Scotland fifty years, married and lived with an alien husband until his death, and still the United States court held her an American citizen though the grounds of the decision are not clear.

In the same year the Degallado case brought this opinion: "It would seem that the marriage of a female citizen of the United States with a foreigner, the subject of another country by whose laws marriage confers citizenship upon the wife of a subject, and her removal out of the jurisdiction of the United States and residence in the country of her husband's citizenship would divest her of her native citizenship. But it does not necessarily follow that she becomes subject to all the disabilities of alienage, for instance, as inability to inherit or transfer real property." Similarly in 1890 it was held "that her American citizenship was held for most purposes to be in abeyance during coverture, but to be susceptible of revival by her return to the jurisdiction and allegiance of the United States."

More Acts of Congress

STILL another decision had to be made in 1883. A French girl came here with her parents. They did not seek naturalization. She married an American citizen, and at his death married Mr. Pequinot, also a native of France who never sought naturalization. Then we learned that "an alien who has once become a citizen by marriage which is subsequently dissolved may resume her alienage by marriage to a native of her own country."

Nellie Grant Sartoris, General U. S. Grant's daughter, settled her case in a more original manner. Her husband was a British subject. Likewise she became one, and lived in England until his death. On her return home she petitioned the restoration of her American citizenship. So, the Senate and House of Representatives in Congress assembled and declared she was "unconditionally readmitted to the character and privileges of a citizen of the United States." That was in 1896.

Verily, they had had trouble, trouble, trouble. Still even our most recent legislation won't wholly mollify the women. Here it is, in the Act of March 2, 1907: "To resolve any further doubt that might exist because of variant decisions of the courts and opinions of secretaries of state as to the effect of the marriage of an American woman to an alien, the citizenship commission of 1906 recommended, and Congress enacted the following: Any American woman who marries a foreigner shall take the nationality of her husband. At the termination of the marital relation, she may resume her American citization if abroad, by registering as an American within one year with a consul of the United States, or, if residing in the United States at the termination of the marital relation, by continuing to reside herein." In the same manner has the matter been fixed by statute in most civilized countries.

Not one word of the American woman who loses her citizenship though she never steps foot out of her native United States of America!

Mercy, how I have digressed from my own simple story! The naturalization court interested me greatly. I went along, not because there was any need whatever for me, but just to see what I could see. A small room it seemed to me (I had never been in a court before), and fairly crowded. Seated probably a hundred people. Folks sat mostly in groups of three. Foreigners, the larger part Italians and Spaniards. There were a

Recapitulation

TWO years is a short time in the life of a man, a shorter period in the life of a nation and but a second in the history of the world, yet there are those who view the condition of the nations at the approach of the second anniversary of the armistice with alarm and who profess to feel that the world as a whole has done very little toward its own redemption.

Russia, they say, is in the grasp of what appears to be nothing better than anarchy. Austria is prostrated. Poland is in arms. Ireland is in rebellion. France is dissatisfied with the spoils of the victor; Germany is impoverished by the price of defeat and England and Italy are torn by labor disturbances. There is peace at home, but even here we are discovering that one cannot dance without paying the piper and we are facing the bills for our period of national and private extravagance.

The indictment sounds serious enough but before agreeing with the pessimists who think that everything is wrong, would it not be well to consider just how long the world was desperately sick before we attempted to pass judgment on the time necessary for its recovery?

It is claimed that the World War was 40 years in the making. We know that it lasted four years. Therefore, but one-twentieth of the time spent in making the war and only half the time spent in fighting it have so far been occupied by the period of spiritual and material rebuilding.

It is true that Russia has been undergoing revolution for four years. Is that too long a period? The French Revolution lasted for 10 years and kept all Europe an armed camp.

Admit that Austria is slow in recovering! What else can be expected of an empire which was politically and geographically demolished and which must actually be born again?

Poland in arms is but the reflection of Russia's condition. Ireland in rebellion is only indirectly a result of the war. Italy and England have difficult labor problems on their hands, but it is noticeable that the Bolshevik movement which was at the bottom of Italy's unrest is collapsing, and it cannot be said that the strikes and riots in England are much worse than several similar occurrences in the United States.

France may be dissatisfied but she is being paid. Germany may be impoverished in material wealth, but not in industrial spirit.

The period which we have entered in our own country may seem lean, but it has been balanced by the fattest years that this or any other country ever saw. We have known that the silk shirt era could not last forever, that eventually we must put on our overalls and go back to work, and to the credit of the people it can be said that thus far the change is being accepted philosophically.

Does it mean nothing when one considers the fact that, with the exception of Russia, the nations which bore the brunt of the war are hard at work paying their debts? Does it mean nothing at home that we are experiencing a bountiful harvest, that prices are coming down and that industry is rapidly adjusting itself to the changed conditions?

One does not need to be a silly optimist to see these things. It is, in fact, impossible to deny them. No man, unless he suffers from mental myopia, can look back on the condition of the nations as they wallowed through the quagmire of war two years ago without realizing that civilization's recovery has been a wonderful thing, or without feeling that this anniversary of armistice day should be marked by a spirit of thanksgiving rather than by one of apprehension.

The Alarm Clock Habit

A YOUNG man who always depended upon an alarm clock to awaken him in the morning one night forgot to wind it. In consequence of this, he overslept and missed an appointment in regard to an important position he was seeking. When he arrived he found it filled; another had been on time and secured the place.

"It was all on account of the alarm clock," he said to his friend when relating the incident. "No," rejoined the other, "it was because you depended upon the alarm clock and not upon yourself."

There are many people, both men and women, who have the alarm clock habit. They do not like to think for themselves. They depend upon some one else to tell them when a thing should be done, and oftentimes how it should be done. They like to lean upon somebody rather than to take the initiative. They say, "If I get into a tight place I will ask someone what to do. Why should I worry to work out the plan myself?"

In business there are many alarm clock men. If they are told to do a piece of work, instead of figuring out themselves the best way to do it, they will ask someone else. Everything they do is by rule of thumb. If the whistle was not blown at noon the probability is they would not go out to lunch. They want to be called and not to do the calling.

Isn't it a splendid thing to think for yourself? To decide for yourself? To act for yourself? To feel that through your own efforts you are building character, and business, and prosperity? To know that, although you may take counsel of older and wiser heads, the final decision in any matter is yours, and yours alone? To have the courage to do without waiting to be bolstered up by someone else whom you have learned to lean upon?

Try it for a week and see how it turns out. Let every day of the seven be a day of "derring do." Relegate the alarm clock of your mentality to the dust heap of failures to be found along the road of life. Look up and get your time from the sun, and let its rays guide you, and at the end of the week you will have forever done with the alarm clock habit.

A Fair Price for Wheat

NO ONE will contest the justice of the wheat growers' claim to a profit on their crops and, while the proposition has not proved sound in industry, one may even incline sympathetically toward their demand that the price of wheat be high enough to cover the "cost of production plus a reasonable profit."

But what is the cost of production?

Is the price of $3 a bushel, demanded by the farmers, based on carefully compiled statistics, or is it merely an arbitrary figure?

The public is not disposed to ask the farmer to work without profit, but at the same time it would like an answer to this question before accepting the proposed price as equitable, and it would seem as if the organizations which stand as the farmers' spokesmen would perform a service by coming forward with a reply.

The general supposition is that the figure is merely an arbitrary demand and if this is true there is no reason for believing it will be accepted with equanimity by the consumer.

With every business enterprise in the United States straining to meet changing conditions, with prices dropping and with labor facing a more or less doubtful winter, the farmer will need to present strong proof that he cannot afford to lower the price of wheat, or he will lose his case.

If, on the other hand, the farmer can show the justice of his claims, and at the same time can prove his charges that the reduction in the wheat and corn market has been the work of manipulators bent on securing control of the nation's food supply at a low price with the intention of raising prices as soon as their hold is secure, the public will make common cause with him and both producer and consumer will benefit by the closer relationship which will result.

Wanted: An Advertising Law

IT IS probable that one of the measures which will be proposed at the next session of Congress will be the enactment of a law against fraudulent advertising, aimed at the promoters of wildcat stock companies.

It is said by bankers, and agreed to by government representatives, that the public has been robbed of millions upon millions of dollars of savings during the past two years through the sale of worthless stocks.

The government attempted to do what it could soon after the close of the war but without much avail. The Capital Issues Committee, which protected the public from worthless stocks during the war, disbanded and its services were no longer available, the post office could not police the country effectively with the force and means at its disposal, and so the work was finally turned over to the Federal Trade Commission.

Efficient as the commission usually is in handling matters entrusted to it for disposal, it labored under a considerable handicap in this case since there was much doubt as to its powers, and because it was already deeply engaged in important work.

The investors' protective bureau of the Chicago Association of Commerce reports that there are at least a billion dollars' worth of wildcat securities being offered to the public at the present time. One hundred twenty million dollars' worth of fraudulent stocks have been driven out of the state of Illinois alone this year and public confidence in securities, formerly at a very low ebb, has been greatly restored.

It is found, however, that the blue sky laws of the various states are not in themselves sufficient to cover the situation. There is a need, it appears, for a national law which will compel the promoter of securities to prove the statements in his copy before his advertising is given to the public.

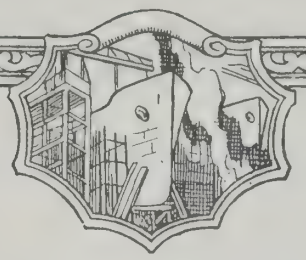
The trouble with most of the laws aimed at fake stock promoters is that they do not operate until the swindler has fleeced a number of victims. The thing that is needed is a law that will lock the door before the horse is stolen and there is good reason to believe that a national advertising law will fit the situation.

Business Schools for Farmers

MICHIGAN AGRICULTURAL COLLEGE is preparing to conduct 50 business schools for farmers this winter. According to the farm management bureau of the college, there are still a great many farmers who handle their accounts on a hit-or-miss system which is never accurate and generally so misleading that it does actual harm.

The bookkeeping system which is to be taught will be simple and practical. Its object is to enable the farmer to determine the cost of all his crops, so that he may find out which ones are making him money and which are sold at a loss. Armed with this knowledge he can search intelligently for errors in farm management.

The Department of Agriculture has but lately completed surveys of farm profits in three important regions of the United States which reveal the astonishing fact that most of the farms studied are earning less than $500 a year net profit, for their owners.



The studies covered seven-year periods in two of the areas and five years in another. Representatives of the department made yearly visits to the farms listed and compiled their figures with the assistance of the owners, so that the results are as accurate as care could make them.

The first group of farms studied was in the hill country of Ohio, the second in the corn belt of Indiana and the third in the dairy region of Wisconsin, from which it will be seen that the districts chosen were fairly representative of the nation.

Not all the responsibility for small profits can be laid to low prices, because during the last few years of the experiment prices were very high. Some of the blame undoubtedly rests on errors in farm management and it is here that the keeping of a set of farm accounts will prove invaluable.

The farm is the food factory of the nation. It needs the same efficiency in management, the same attention to holding down overhead expenses, the same detailed information concerning cost of production, that a factory must have to be successful. And it is a hopeful sign to note that this fact is so generally acknowledged that one college is finding it necessary to open fifty winter business schools to meet the demands of farmer business men.

Mr. Ford's Page

UNEMPLOYMENT has two sides. The first and most urgent, of course, is the individual side. A man's job is the means by which he negotiates with the rest of the world for his support. His job is the certificate of his right to be a man among men, because he is doing a man's part. When anything occurs that separates the man from the job, or that renders the job temporarily unnecessary, there is a break in the alignment of individual affairs. When this happens on a large scale, when many jobs suddenly become unnecessary for any reason whatever, the dislocation is serious. It is felt everywhere, of course, but it is felt most keenly just at that point where individual need and supply, or family need and supply, meet.

The other side is society's side. Unemployment is a detriment to society at large. It is not to be estimated in money, for this is one of the numerous instances where the interjection of the dollar sign gives a wrong significance to the whole matter.

Now there are two statements which are true, namely: There is always something to be done, and, There is no one but ourselves to do it.

Even in the face of unemployment it is always true—There is always something to be done. Suppose we see large groups of idle men from the building trades. They are unemployed. For the time being they appear useless to themselves and to everyone else: at least, unemployment tends to make a normal man feel that way. So, there they are—a large, intelligent and useful group—idle. What is the cause? Isn't the world crying about a shortage of houses? Aren't there enough demands for homes to keep the building trades working at full time and overtime for years to come? "Yes," someone answers, "but, you see, there is a shortage of building materials. These men have nothing to do because they cannot get materials."

Oh! there is nothing to be done in the building trade, because there is something to be done in the building material trade, is that it? So much learned; then there really is something to be done. There is unemployment here because there ought to be more employment yonder.

Or take a large factory somewhere which has closed down. You ask the men why they are not at work. "Can't get any coal," they say. Why not? "Not producing it at the mines." Very well; here is unemployment at the factory because there is not sufficient employment at the mines.

You go to the mines and inquire what is the trouble. "Can't get any cars." Then you go to the railroads and inquire into their trouble. "Can't get cars made fast enough."

The result of the whole tour is a pretty clear idea that certain men are not able to work because there are not enough men working somewhere else. Either the producer of raw material is handicapped, or the transportation of the material is handicapped and the result of insufficient employment at one place is unemployment at another.

And yet, while men here are saying, "Nothing to do," conditions yonder are crying, "Much to be done." That is the point. There is always something to be done.

If men cannot work because the material cannot be shipped, then the "something to be done" is on the railroads. If men cannot work because coal is scarce, then the "something to be done" is at the mines. If the building trades are idle because there is a scarcity of lumber, then the "something to be done" is in the great labor forests. The world's job never plays out. There is always something to be done!

Now, the second truth comes in just here: there is no one but ourselves to do it. The conditions at mine, forest, railroad do not right themselves. If it were a shortage of hay, we should have to wait until the hay season rolled round: the condition would right itself. But a shortage at mine, railroad or forest is not iron-bound by natural law, it is remediable by labor. Unemployment does not remedy anything. The very best it does is to wait for insufficient employment elsewhere to catch up. Sufficient or extra employment elsewhere will, naturally, make it catch up all the more speedily. If there were 20 men divided into four equal groups working on a job, and if one of the groups fell behind to such an extent that it held up the other three, what would be the logical thing to do? Have the three hindered groups turn in and help the group which had hindered them by falling behind, would it not?

Men do this on the farm, in the shop, in the store. When the stock clerk downstairs is slow in getting the stock up to the showcases and counters, the merchant does not close his store until the stock clerk can get the stock upstairs. No, he sends help downstairs and gets the stock up as quickly as possible in order that trade may not be interrupted.

Why are we not as wise in the industrial field at large? Why cannot there be a systematic and wisely managed transfer of men in order to prevent the failure at one point tying up the work at another point? This transfer, of course, actually does occur after a fashion. But it is a very haphazard fashion. We expect "labor conditions," or "economic conditions," or "business conditions" to right themselves by the accidental and undirected flow of the needed element toward the place where it is needed.

But men do not direct their own business that way. They do not say, "There is a shortage in the tool shop, but it will right itself; when the rumor gets around, men will begin to drift that way." No. They say, "Send 100 men to help them out in the tool shop."

In the great world of industry we largely trust to rumor to effect the change, and it is not effected very readily in these days. There have been numerous instances during the last two years when a mobile force of labor, available for three months here, or six months there, would have been sufficient to fill up all deficiencies and would have provided just that masterful reinforcement in the production or transportation of material that would have kept all business on an even keel.

There are always those who object to a suggestion like this on the ground that it smacks too much of officiousness on the part of employers. Shifting men from place to place, they say, is not agreeable. It savors, somehow, of indignity.

It need not be a matter for employers at all. Let it be entrusted to the government, or some co-operative department controlled by employers and employes for the purpose of maintaining an even balance between Agriculture and Mining, Transportation and Manufacture, and thus keep employment steady.

As to the shifting of men, there surely ought to be flying squadrons of young men who would be available for emergency conditions in harvest field, at mine, in shop, or on railroad. If there was danger of loss from fire, everybody would run to prevent it. If there is danger from loss by unemployment, people should be equally ready to run and prevent it. If the fires of a hundred industries threaten to go out for lack of coal, and 1,000,000 men are menaced by unemployment, it would seem both good business and good humanity for a sufficient number of men to volunteer for the mines and the railroads to prevent that occurrence.

There is always something to be done in this world, and there is only ourselves to do it. The whole world may be idle, and in the factory sense there may be "nothing to do." There may be nothing to do in this place or that, but there is always something to do. It is this fact which should urge us to such an organization of ourselves that this "something to be done" may get done, and unemployment reduced to a minimum.

THE world has never yet come to the point where there was nothing to be done. There is always something waiting to be done. In the most "idle" times, when shops are closed and men are out of work, there is always much that should be done. That is one of the mysteries of unemployment. With so many things waiting to be done, why should there be idle times? It seems to be a matter of distribution—like the question of food. If we could distribute labor, if we had mobile organizations of young men, who would serve as flying squadrons, going here for three months or there for six months as they might be needed to keep industry on an even keel and keep supply and transportation moving in order that every shop might be kept busy, it would help out one side of the problem.

The Man Who Made Harold Bell Wright

Message in "That Printer of Udells" Caused E. W. Reynolds to Publish First Book by "Dickens of the Rural Route"

By JOHN B. WALLACE

THE title of this article may sound like a pun but you may rest assured it was not intended for one. It is the truth but not all the truth, for if Elsbery W. Reynolds made Harold Bell Wright, conversely Harold Bell Wright made Elsbery W. Reynolds. If ever two men were interdependent for success they were these same two. The sheer business ability and untiring industry of the one and the genius of the other might eventually have brought them prosperity but it is doubtful if either would have attained his present pinnacle of fame and fortune. It took the mysterious hand of that master alchemist, Fate, to transform these two men—one a struggling bookseller, the other a poverty-stricken preacher—into millionaires of national prominence.

A peculiar kinship of spirit brought these men together and knitted them into bonds of friendship that have remained intact to this day. Wright has always insisted that Reynolds is the only man who understands him. Reynolds says that the inspiration of Wright's abiding and unshakable faith gave him the courage to persist in the face of almost insurmountable difficulties.

As I sat, the other day, on the spacious porch of the Reynolds mansion at Relay Heights, in Southern California, and allowed my eyes to roam over the magnificent estate—one of the show places of the Southland—it was hard to realize that some three decades back the owner had been ringing doorbells in the small towns of the Middle West in the humble and despised rôle of book canvasser.

The face of the man beside me was the face of a dreamer, a student. If you did not know the man your first guess would be that he was a college professor. Only the keen glint in his eyes and the square set of his jaw betrayed the man of affairs. But behind the soft-spoken courtesy, the kindliness of his manner, one caught a hint of that egotism that is ever present in men of strong will, an egotism tempered by dearly bought knowledge of human limitations. One sensed that here was a man who had risen through his own efforts, a man to lean upon but not one who leans, a man who liked to grant favors but not to ask them. And to one knowing the proud spirit of Harold Bell Wright, uniting the sensitiveness of the artist with the zeal of the exhorter and the positiveness of a genius, the thought involuntarily comes, how has the friendship of these men, both of such positive temperament, persisted unimpaired throughout these long years?

Perhaps the story of their lives is the answer.

Mr. Reynolds attributes his success to the lessons he learned through necessity.

"Necessity is as truly the mother of success as she is of invention," he says. "Many a man fails to find himself until forced by adverse circumstances. Then he makes or breaks."

Mr. Reynolds was born on a farm in Missouri. He went to a country school and then for a couple of years to a grade school in a near-by town, after which he was turned adrift to hunt for a job. Purposeless, with no definite ambition, he drifted from one job to another his only object being to find something which would enable him to exist.

Attracted by the glittering inducements held out to book solicitors he started out as a canvasser. He soon found that the promise of big money for easy work was a myth. He found that he had tackled one of the hardest games in the world, a job replete with heartbreaking disappointments. But his pride was engaged and he would not quit. Book canvassing is the acid test of salesmanship. The canvasser is not only trying to sell something that the customer does not want, usually cannot afford, but is compelled to invade the victim's home to do so. But young Reynolds found in it a freedom which he loved and an uncertainty that appealed to his spirit of adventure.

"There is no better training for a young man than ringing doorbells," he told me, as his eye strayed over his countless acres of orange trees. "It teaches him persistency, courtesy and gives him a knowledge of human nature that he can acquire in no other occupation. It was the knowledge I gained by talking to people in their homes that enabled me to realize the appeal of Mr. Wright's books. It enabled me to direct my advertising straight to the heart of the people who make up the backbone of America. That is why you will find his books, not in the homes of the wealthy and cultured, but on the little shelf beside the family Bible in the farmhouses and in the small towns. It is not always given to us to see that, although we seemingly are making no progress toward the great goal of success, we are unconsciously acquiring the qualities and experience that will eventually bring reward."

Book canvassing finally brought the young solicitor to Chicago where he spent ten of the best years of his life vainly trying to get a foothold. At last discouraged with the meager opportunities of a salaried man he determined to go into business for himself. With his own capital, amounting to but $115, he incorporated the Book Supply Company. Then began the real battle. Time after time it seemed as if nothing could prevent the little company from foundering. But somehow Reynolds always managed to pull it through. And then in 1901 came the event that was finally to set his feet on the broad highway of achievement.

Mr. Reynolds had always been an ardent church worker. While attending services one Sunday he heard Harold Bell Wright, a minister from Kansas who was substituting for the regular pastor, deliver a sermon called "Sculptors of Life" which so impressed him that he sought the visitor out after the closing prayer. This meeting proved to be the turning point in both of their lives.

Mr. Wright had also endured a life of toil and privation. He had contended with not only poverty but ill health. Born in 1872 at Rome, New York, he had been one of four boys, only two of whom survived. Left motherless at the age of ten, this boy, shy but proud, was early sent forth to do battle with the world. He had some talent as a painter and it was toward an artistic career that his first ambition was directed. Lacking the means to study under a master he was forced to turn his ability to such humble channels as decorating and house painting. While in the little quarry town of Grafton, Ohio, he had been converted to the doctrines of Christianity and his imagination fired by the possibilities of reformation in that field, he resolved to abandon painting and become a minister. With this end in view he—at the age of twenty—entered the preparatory department of Hiram College. He had no means whatever and was forced to labor after hours to subsist.

The strain of overwork proved too much for his not overly strong constitution and he was soon forced to quit college. He sought to regain his health in the Ozark Mountains in Southern Missouri where he obtained employment at farm work, painting and sketching during slack intervals.

It was here that he gained the keen insight into the character of the mountain folk that enabled him to picture them so accurately in "The Shepherd of the Hills" and other of his books. It was here also that he preached his first sermon. He found a peculiar appeal in his ministry to these simple people and soon he accepted a regular pastorate at Pierce City, Missouri. His salary was $400 a year and a large portion of that in garden truck. .

Soon after his marriage he received a call to Pittsburg, a little mining town in Kansas. Here in this rough little city the young minister found ample work for his crusading spirit.

It was while fighting evil in this little town that he conceived the idea for his first book, "That Printer of Udells." This was an exposition in story form of ideas for church reformation which he had been expounding from the pulpit. He saw that the church as it was then conducted was accomplishing but little good in the reformation of the community and he wanted to reorganize it on a more practical basis. He had no intention of writing a novel when he began the story but intended reading it to his congregation in lieu of a sermon. His friends, however, persuaded him that the work had merit and he set forth to Chicago to find a publisher.

Immediately he found himself confronting a stone wall of prejudice. Publishers could see no money in a book with a religious theme, especially with the scenes laid in the present. That was the day of the historical novel and the swashbuckler romance. Disheartened, Wright was about to return to his little church at Pittsburg when he met Reynolds.

Encouraged by the enthusiasm with which his sermon had been received he asked the book dealer to read his story. Mr. Reynolds readily consented but told Wright that he could not consider publishing it as his company was not a publishing house but mail order booksellers.

To alleviate the author's manifest disappointment, Mr. Reynolds promised him his assistance and advice in getting the book published elsewhere if he found it meritorious.

"I had hoped you could find means to publish it yourself," Wright told him. "I thought maybe it could be printed with paper covers to sell for about fifteen cents. I did not write the book to make money. I want to get my message before the world."

He was told to call the following Friday as the book dealer was too busy to read the novel except in the evenings after work.

When Wright next called upon his newly found friend a surprise awaited him.

"Mr. Wright," the publisher said, "I have decided to publish your book myself. If I can break even on it I will be satisfied in the knowledge that perhaps it will do for some other man what it has done for me."

As Mr. Reynolds repeated this conversation the other day he

HAROLD BELL WRIGHT

Mr. Reynold's beautiful home in Southern California, a show spot of the Golden State.

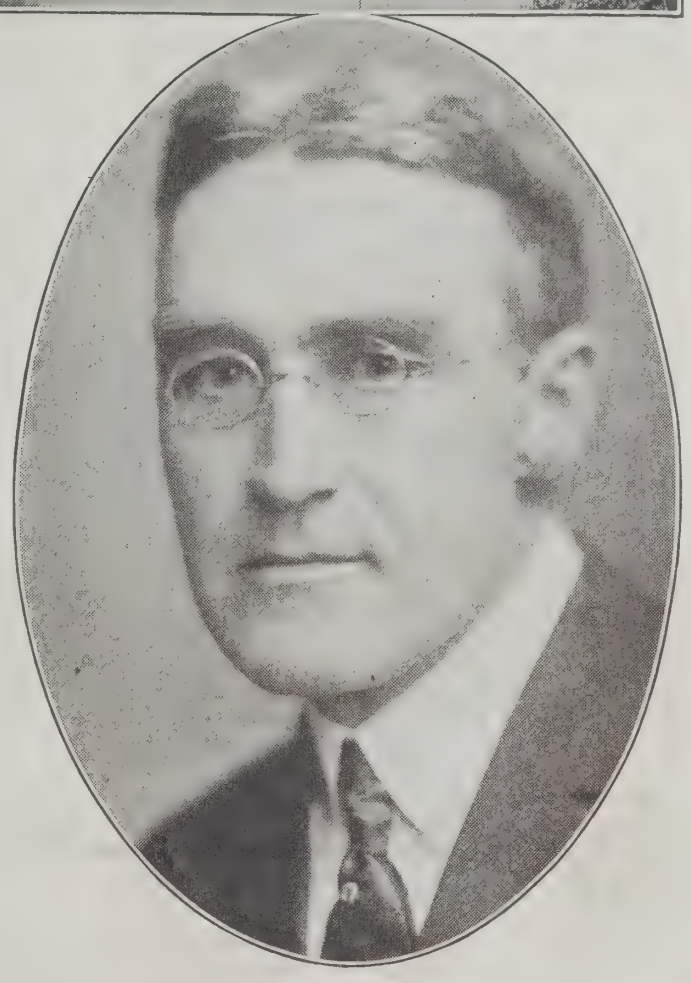
turned to me earnestly. You could see that despite the long interval of years he was still affected.

"There was something about that manuscript that took hold of me," he said. "We were having more than our share of business troubles and reverses at the time but after reading 'That Printer of Udells' I felt like taking off my coat and pitching in with renewed vigor. I felt also that a book that would inspire me like that would inspire others. The result justified my faith."

It was indeed from a business standpoint a desperate venture—an unknown writer and an unknown publisher. By straining his credit to the utmost Mr. Reynolds was able to raise $10,000 with which to finance its publication. A large portion of this money was spent on advertising. The first edition was twenty-five hundred copies. More than a half million copies have been sold. The book broke even financially in its second year.

Thus did the man whose books have year after year topped the list of best sellers get his first hearing. No small part of the immense sale of his works has been due to the clever advertising of his publisher. Mr. Reynolds knows this part of the business from the ground up.

"It is not as simple a matter as it would appear," he explained. "Logically, you must first sell the jobber, then the dealer and lastly the public. But in reality the process is reversed. The public must be sold first; that is, the demand created. Very few book dealers are real salesmen. They simply wrap up the goods and take the money. The publisher is the real salesman. He creates the demand by advertising. But he must see to it that the jobber is stocked with the goods to meet the demand. Otherwise his work is wasted."



Mr. Reynolds does not agree with the critics who argue that Wright's books would have but small sale if it were not for the extensive advertising done in their behalf.

"No amount of advertising can put over a book unless it has merit," he said. "People may read the first one through curiosity but they read the second because they like the author. Mr. Wright's books have had a steadily increasing sale. The last two have each gone well over the million mark."

Perhaps no modern writer has aroused the discussion among the critics that Mr. Wright has. Every new book is the signal for an outburst of sarcasm among the reviewers. Mr. Wright has never outgrown a certain crudity of style. In his later books there is a tendency toward melodramatic effect that seems somewhat strained and artificial. But like many writers greater than he, what Mr. Wright lacks in finished technique he makes up in the power of the message he conveys. All his books have been written with an underlying purpose that grips the reader. The lack of polish is forgotten long before the message loses its force. He reaches the people he wants to reach. What more could be desired?

Both Mr. Reynolds and Mr. Wright have deserted the Middle West and settled in California. Mr. Wright, whose health is far from robust, spends a great deal of his time in the deserts and mountains of California, Arizona and Nevada. Most of his later books have been written while on the lonely desert or high in the mountains. He is very fond of the outdoors that has permitted him to retain the vitality to complete his life work.

Mr. Reynolds also came to California in search of health. The strain of the terrific struggle of his younger days was too much for even his country-bred constitution. He has gone back to the soil and personally superintends his immense fruit ranch. Already, he declares, he has added ten years to his life.

E. W. REYNOLDS

In his little study among the pepper trees on his half million dollar estate he plans the advertising campaigns for each new book by Mr. Wright but he leaves the execution of his plans to his associates. Twice he has left the Relay Heights home to superintend the filming of two of Wright's books but ten months out of the year will find him busy among his orange groves.

Many authors have importuned him to read their works but he turns a deaf ear. He has published only one man's books. Harold Bell Wright has had no other publisher. It is a matter of sentiment with him. Perhaps some day he will change his mind but he doubts that he will ever find another Harold Bell Wright.

The Romance of Soapstone

ROMANCES and soapstones may seem far apart; they may be now, but they were in other days about as close as romances and diamonds. Long ago diamonds were a real-for-sure luxury within the reach of few. So, of course, romances hinged upon other mediums.

When our fathers and mothers went to school, pencils of lead encased in wood, also pads of scratch paper, were uncommon. Susie had a slate, Johnny had a slate, likewise Susie's sister and Johnny's brother; almost every one of the boys and girls had slates. They also owned pencils of stone which gave out an unpleasant grinding or screaking noise when used. At rare intervals somebody would acquire a lighter colored pencil which possessed the envied quality of moving softly over the surface of the slate. The fortunate boy or girl would invariably proclaim it "a daisy 'cause it's soapstone."

In those old days of the long ago it was no small honor to have or to hold a smooth-marking pencil of soapstone, the acme of excellence by virtue of its ability to glide along without complaint. Of course, Johnny and Susie and the other unfortunates became frankly covetous. All the fellows would immediately begin to talk "a trade." Presently some sprightly, coy wearer of pigtails would proceed to put the unselfishness of the owner and the vulnerability of his heart to the acid test by asking a loan of the magic pencil "till recess." His compliance often revealed the identity of the girl whom he had been secretly adoring all the while. His resurrection of the scratcher which he had shoved to the farthest corner of his desk betokened a childhood romance budding and flowering with the fragrance of that in Whittier's exquisite poem, "In School Days."

Don't tell me that plebeian old soapstone has not played a real part in the motivation of Cupid's darts and arts. In that pencil rôle, however, it is now a has-been.

Soapstone is the name that loosely designates many minerals with differing properties. They are alike, nevertheless, in one respect; all have a peculiar feel or texture that reminds one of soap or, indeed, of grease.

Your grandfather and grandmother, possibly your father and mother, can tell you that soapstone can't be beat as a footwarmer. In the age before the introduction of the hot water bottle of rubber which we know so well today, stones and bricks were successfully employed in caring for the sick and as a rude sort of portable stove to make travel in winter less rigorous and more comfortable than it would be without the device. The preferred material was soapstone, for, though slow to warm up, it assuredly retained the heat.

This rock, scientifically termed steatite, is mined in Germany and the British Isles, also in many of our states including Massachusetts, Vermont, New Hampshire, New York, Maryland, Pennsylvania, North Carolina, Georgia and Virginia. The quarries of Vermont undoubtedly produce the best grade for heating purposes, whereas the Virginia variety has established its superiority for fabricating or general manufacturing.

As acids do not affect soapstone, chemists use it as a substitute for cork stoppers, though glass is now more popular. Tailors mark cloth, for cutting or altering, with a type of soapstone that approaches talc in softness and which also serves as the body or base of many tooth and face powders. Tire talc, employed by chauffeurs to prevent friction between the inner tube and the outer casing, is usually nothing more than ground soapstone. Shoe dealers use this same material for dusting new footwear so it will slip on and off easily. This soapstone, or steatite, is a member of the talc family though somewhat more compact than the mineral possessing that name.

When carpenters are idle, the market for this greasy substance is largely becalmed; when these planers of wood and drivers of nails are rushed, the quarries show an increased business. Thus soapstone has become a dependable indicator or barometer, revealing the "ups" and "downs" of building activities.

Today the romance that started with the loaning of a soapstone pencil never happens; for both the pencils and the slates have gone out of style. The mineral now assists Cupid in two ways, and I surmise it is every bit as effective as in the long ago. Would feminine wiles be half as fetching if they were not abetted with face powder? And there are no statistics on how many shoe clerks have been bewitched while waiting upon some fairy-like customer, dusting the clever creations of leather, and trying them on a pair of dainty feet encased in a pair of silken hose.

Why and Because

Why do we use the expression "apple pie order" when we mean that things are exactly in their right place?

Because every Saturday a certain Puritan dame, Hepzibah Merton, made a practice of baking two or three dozen apple pies which were to last her family through the week. She placed them on the shelves in her pantry, labeling each according to the day of the week on which it was to be used, and the pantry, thus arranged, was said to be in apple pie order.

Why is an unmarried woman called a spinster?

Because women were prohibited from marrying in olden days until they had spun a full set of bed furnishings and thus, until their marriage, they spent much time at the spinning wheel and were, therefore, "spinsters."

Why do clergymen habitually wear black?

Because when Martin Luther, in 1524, laid aside the habit of a monk and adopted the style of dress prevailing at the time, the Elector of Saxony used to send to him from time to time pieces of black cloth, that color then being fashionable at the court. Luther's disciples thought because he wore black, it became them to do so, and thus it came about that the clergy generally grew to regard it as the only proper color for them to wear.

Why is a woman's allowance called pin money?

Because at the beginning of the fifteenth century pins were considered a very acceptable present by women, who up to that time had used wooden skewers. Sometimes money was given with or instead of pins, and was called "pin money."

Why do we say: "Mind your p's and q's"?

Because in ancient times, behind the door of each alehouse there hung a slate, on which was written, P., which stood for pint, and Q., which stood for quart. A number was placed opposite each customer's name, according to the amount he imbibed. He was not expected to pay until Saturday night, when he had to "mind his p's and q's."

Why the Jews Dislike the Morgenthau Report

The Samuel Report Is Printed Everywhere, But the Morgenthau Report Is Not. U. S. Jews Prefer to Have Americans Read the British Report. Why?

IT SEEMS a far cry from the Jewish Question in the United States to the same Question in Poland, but inasmuch as the Jews of the United States are constantly referring to Poland for propaganda purposes, inasmuch as there are 250,000 Polish Jews arriving in the United States on a schedule made by their brethren here, and inasmuch as the people of Poland have had their own illuminating experience with the World Program, it would seem that Poland has something to teach the United States in this respect.

Especially is this true since it is impossible to pick up an American newspaper without finding traces of Jewish anti-Polish propaganda—a propaganda which is designed to take our eyes away from the thing that is transpiring at the Port of New York. If a reader of these articles should say, "Let us not think about Poland, let us think about the United States," the answer is that he already is thinking about Poland the way the Jews of the United States want him to think, and the fact that he is thinking according to Jewish wishes in this respect incapacitates him up to a certain point to understand the entire Jewish Question in this country.

Three chapters back in this series we presented part of a hearing before a United States Senate committee on the census question as it affected the Jew. The immigration question appeared as part of that inquiry. Then followed an article which showed that Jewish authorities adopt principles exactly opposite to those which had been defended before the United States Senators. A third article followed showing how Jewish leaders resent the influence of the Modern State upon Judaism. All these subjects are essential to a well-rounded understanding of the Jewish Question as a whole in its relation to the United States.

Today we go back to the home of that quarter of a million people who are so rapidly being landed on our shores to see what they did there, and to find the basis for Jewish propaganda statements that these people are fleeing from "persecution."

We have five official witnesses whose observations have been printed under the seals of the United States and the British governments. The American document is a "Message From the President of the United States, transmitting pursuant to a Senate Resolution of October 28, 1919, a communication from the Secretary of State submitting a report by the Honorable Henry Morgenthau on the work of The Mission of the United States to Poland." It is Senate Document No. 177.

This document includes also a supplementary report signed by Brigadier General Edgar Jadwin, United States Army.

Morgenthau Displeased the Jews

THERE is a certain mystery about this document. Though an edition was printed for public circulation, it soon became extremely rare. It seemed to disappear almost overnight. The copy from which this present examination is made was secured with the utmost difficulty. The head of that American Mission, which remained in Poland from July 13 to September 13, 1919, was Henry Morgenthau, an American Jew, who had been United States Minister to Turkey, a man of excellent public and private reputation.

It is commonly said that the Jews did not like his report, hence its scarcity. This much appears: The Jewish press has never made much of it; it is not cited in Jewish propaganda; it has not had the endorsement of American Jewry. The reason appears to be this—that it told the calm truth about the situation of the Jews in Poland, and made very fair observations.

But it is indirectly that American Jews show the opinion which they hold of the Morgenthau report, and it comes about in this way: When the American Mission left Poland, the British Mission arrived, and remained until December. The chief member of the British Mission was an English Jew, Sir Stuart Samuel, whose brother Herbert is now High Commissioner of Palestine. He was accompanied by a British military officer, Captain P. Wright, who also submitted a supplementary report. The two reports were submitted with an introductory report by Sir H. Rumbold, British representative at Warsaw.

Now, of all five reports, the Morgenthau, Samuel, Jadwin, Wright and Rumbold reports, *the Jews of the United States have circulated only one*—the Samuel report. It has been printed in full in newspapers at advertising rates; it has been circulated broadcast as an American Jewish Congress Bulletin. Any number of Samuel reports may be obtained, but none of the report which a member of the American diplomatic service made and which the President of the United States transmitted as a Message to the Senate.

Why? Because four reports examined the situation all round and reported it without bias, and if they were printed in the United States and spread broadcast before the people, it would throw an entirely different light on the Jewish propaganda in favor of Polish immigration in enormous numbers.

Even when the Jews of the United States published the Samuel report, they did not publish the Captain Wright report which accompanied it. In the American Jewish Congress Bulletin, the Wright report was condensed, mutilated, and shorn of its real meaning; while in the *Maccabaean,* the reports of Rumbold and Wright are treated without courtesy and the Samuel report published in full.

Jews "The Most Favored People"

THAT the reader may form his own conclusions, the testimony of the five official witnesses (or six, if we count Homer H. Johnson, who signed the American report with General Jadwin) will be given on the principal points; the agreements and disagreements will therefore be noticeable.

1. *ON THE GENERAL SUBJECT OF PERSECUTION.*

Sir Stuart Samuel says: "Poles generally are of a generous nature, and if the present incitements of the press were repressed by a strong official hand, Jews would be able to live, *as they have done for the past 800 years,* on good terms with their fellow citizens in Poland."

Note how easily Sir Stuart talks about repression of the press. The Polish Press has at last obtained freedom of writing. It is exercising a privilege which the Jewish Press of Poland has always had. But now that it speaks freely of Jews, repress it with a strong hand, says Sir Stuart. He would not dare suggest that in England where the Press also is finding its freedom. As to the Yiddish press in Poland, the reader will find some information in Israel Friedlaender's essay, "The Problem of Polish Jewry." Friedlaender was a Jew and his book is published by a Jewish house in Cincinnati. He says:

"The Yiddish press sprang up and became a powerful civilizing agency among the Jews of Poland. The extent of its influence may be gathered from the fact, which curiously enough is pointed out reproachfully by the Poles, *that the leading Yiddish newspaper of Warsaw commanded but a few years ago a larger circulation than that of all the Polish newspapers combined.*"

Henry Morgenthau says (par. 7)—"The soldiers had been inflamed by the charge that the Jews were Bolsheviks, while at Lemberg it was associated with the idea that the Jews were making common cause with the Ukrainians. *These excesses were, therefore, political* as well as anti-Semitic in character."

And again (par. 8)—"Just as the Jews would resent being condemned as a race for the action of a few of their co-religionists, so it would be correspondingly *unfair to condemn the Polish nation as a whole* for the violence committed by uncontrolled troops or local mobs. These excesses were apparently *not premeditated,* for if they had been part of a preconceived plan, the number of victims would have run into *the thousand instead of amounting to about 280.* It is believed that these excesses were the result of a widespread anti-Semitic prejudice aggravated by *the belief that the Jewish inhabitants were politically hostile to the Polish State.*"

Sir H. Rumbold says: "It is giving the Jews very little real assistance to single out, as is sometimes done, for reprobation and protest *the country where they have perhaps suffered least.*"

Captain P. Wright says: "It is an explanation often given of what may be called, according to the point of view, the idiosyncracies or defects of the Jews, that they have been an oppressed and persecuted people. This is an idea so charitable and humane that I should like to think it, not only of the Jews, but of every other people. It has every merit as a theory, *except that of being true.* When one thinks of what happened to the other 'racial, religious and linguistic minorities' of Europe in modern times . . . . *the Jews appear not as the most persecuted but as the most favored people of Europe.*"

Brigadier General Jadwin states clearly that the "persecution" cry may be regarded as propaganda. He says:

"The disorders of November 21 to 23 in Lemberg became, like the excesses in Lithuania, a weapon of *foreign anti-Polish propaganda.* The press bureau of the Central Powers, in whose interest it lay to discredit the Polish Republic before the world, permitted the publication of articles . . . . in which an eye-witness estimated the number of victims between 2,500 and 3,000, although the extreme number furnished by the local Jewish committee was 76." (p. 15)

And again: "In common with all free Governments of the world, Poland is faced with the danger of the political and *international propaganda* to which the war has given rise. The *coloring,* the *invention,* the *suppression* of news, the *subornation of newspapers* by many different methods, and the *poisoning by secret influences of the instruments affecting public opinion,* in short, all the methods of malevolent propaganda are a menace from which Poland is a notable sufferer." (p. 17)

Of course, all this propaganda has been Jewish. The methods described are typically Jewish.

Speaking about the number killed, Mr. Morgenthau estimates the total at 258; while Sir H. Rumbold says that only 18 were killed "in Poland proper," the others having been killed in the disorders of the war zone. Sir Stuart Samuel estimates the total killed at 348.

2. *ON THE GENERAL CAUSE OF JEWISH TROUBLE BEFORE THE WAR.*

Sir Stuart Samuel—"The Jews in Poland and Galicia number about 3,000,000. . . . Public opinion had been aroused against them by the institution of a virulent boycott. This boycott dates from shortly after the by-election for the Duma, which took place in Warsaw in 1912. . . . Business relations between Poland and Russia were very considerable in the past, and were generally *in the hands of the Jews,* not only in the *handling* of the goods exported, but also in their *manufacture* . . . . Initiative in business matters is almost entirely *the prerogative of the Jewish population.* . . . Nearly the whole of the *estate agents* who act for the Polish nobility are of the *Jewish race* . . . . Attention must be paid to the fact that *Jews form the middle class almost in its entirety.* Above are the aristocracy and below are the peasants. Their relations with the peasants are not unsatisfactory. The young peasants cannot read the newspapers and are therefore but slightly contaminated by anti-Semitism until they enter the army. I was informed that it is not at all unusual for Polish peasants to avail themselves of the arbitrament of the *Jewish rabbi's courts.*"

That shows the Jews to have occupied a very favorable position in Poland and is to be remembered in connection with the previous quotation from Sir Stuart in which he says that if the incitements of the Press were repressed by a strong official hand, "the Jews would be able to live, as they have done *for the past 800 years, on good terms* with their fellow citizens in Poland."

Jewish Control of Polish Business

LET us take the points made by Sir Stuart, and observe what the other witnesses say about them:

(a) Beginning with the point as to the Jews' monopoly of business in Poland:

Sir H. Rumbold—"Sir Stuart Samuel would appear to be mistaken in his appreciation of the part played by the Jews in the pre-war business relations between Poland and Russia and in the *industry* of the former country. Whereas it is true that goods exported from Poland were to a large extent *handled* by the Jews, *only a small percentage of those goods were actually manufactured by them.*"

Captain P. Wright—"In Poland until the last generation *all business men were Jews:* the Poles were peasants or landowners, and *left commerce to the Jews;* even now certainly much more than half, and perhaps as much as three-quarters, of business men are Jews."

"For both town and country I think it a true generalization to say that the *East Jews are hardly ever producers, but nearly always middlemen.*"

"Economically, the Jews appear at the very outset as *dealers, not as producers,* nor even as artisans, and chiefly *dealers in money;* in course of time the whole business and commerce of Poland became theirs, and they did nothing else."

(b) With regard to the "estate agents" mentioned by Sir Stuart Samuel:

Captain P. Wright—"Poland is an agricultural country, but the East Jews, unlike the West Jews, play a large part in its country life. Every estate and every village has its Jew, who holds a sort of hereditary position in them; he markets the produce of the peasants and makes their purchases for them in towns; every Polish landowner or noble had his own Jew, who did all his business for him, managed the commercial part of his estate, and found him money. . . . Besides this, nearly all the population of nearly all the small country towns is Jewish, corn and leather dealers, storekeepers and peddlers, and such like."

(c) Regarding Sir Stuart's assertion that "Jews form the middle class almost in its entirety," with the nobles above them and the peasants beneath them (a typical Jewish position—dividing Gentile society and standing between the parts), this illustration may help to make it clear:

Captain P. Wright—"It is instructive to try and imagine what England would be like under the same conditions. Arriving in London, a stranger would find every second or third person a Jew, almost all the poorer quarters and slums Jewish, and thousands of synagogues. Arriving at Newbury he would find practically the whole town Jewish, and nearly every printed inscription in Hebrew characters. Penetrating into Berkshire, he would find the only storekeeper in most small villages a Jew, and small market towns mostly composed of Jewish hovels. Going on to Birmingham he would find all the factories owned by Jews, and two shops out of three with Jewish names."

Captain Wright is trying to give the people at home a picture of conditions in order that they may understand how Poland feels. The Jewish press strongly resented this. Sir Stuart Samuel's report is notable for the number of things he mentioned, and the few he explained.

3. ON THE GENERAL CAUSE OF TROUBLE ARISING DURING THE WAR.

Sir Stuart Samuel—"The fact of their language being akin to German often led to their being employed during the German occupation in preference to other Poles. This circumstance caused the Jews to be accused of having had business relations with the Germans . . . . The Government publicly declared its disapproval of boycotting, but a certain discrimination seems to have been made in the re-employment of those who served under the German occupation. I find that many Jews who thus served have been relieved of their offices and not reinstated, whereas I can find no evidence of similar procedure in regard to other Poles."

Sir H. Rumbold—"The fact of Yiddish being akin to German *may* have been the reason why the Germans employed a large number of Jews during their occupation of Poland, although a great many of the Poles with a good knowledge of German could have been found. *There is this difference, however, that the Poles only served the Germans by compulsion,* as they considered them to be their enemies."

Brigadier General Jadwin—"During the German occupation of Poland, the Germanic character of the Yiddish vernacular and *the readiness of certain Jewish elements to enter into relations with the winning side,* induced the enemy to employ Jews as agents for various purposes and to grant the Jewish population not only exceptional protection, but also *the promise of autonomy.* It is alleged that the Jews were active in *speculation in foodstuffs,* which was encouraged by the armies of occupation with a view to facilitating export to Germany and Austria." That is, the Jews were the means by which Poland was to be drained of its food supply.

Captain P. Wright—"But the high day and triumph of the Jews was during the German occupation. The Jews in Poland are deeply Germanized, and German carries you over Poland because Jews are everywhere. So the Germans found everywhere people who knew their language and could work for them. *It was with Jews* that the Germans set up their organization to squeeze and drain Poland—Poles and Jews included—of everything it had; *it was in concert with Jews* that German officials and officers toward the end carried on business all over the country. In every department and region they were the instruments of the Germans, *and poor Jews grew rich* and lordly as the servants of the masters. But though Germanized, *the accusation of the Poles that the Jews are devoted to Germany is unfounded.* . . . They have no more loyalty to Germany—the home of anti-Semitism—than to Poland. *The East Jews are Jews and only Jews.* . . .

"It had seemed certain that one of two, the German or the Russian Empire, must win, and that *the Jews, who had their money on both,* were safe; but the despised Poland came in first. Even now the Jews can hardly believe in its resurrection, and one of them told me it still seemed to him a dream."

Mr. Morgenthau does not touch this matter in his report.

4. WITH REFERENCE TO THE BOYCOTT, THE METHOD BY WHICH THE POLES SOUGHT TO LIBERATE THEMSELVES FROM THE JEWISH STRANGLEHOLD.

Sir Stuart Samuel—"This boycott dates from shortly after the by-election for the Duma, which took place in Warsaw in 1912 . . . During the war, owing to the scarcity of almost everything, the boycott diminished, but with the armistice it revived with much of its original intensity . . . . A severe private, social and commercial boycott of Jews, however, exists among the people generally, largely fostered by the Polish press. In Lemberg I found there was a so-called social court presided over by M. Przyluski, a former Austrian vice president of the Court of Appeals, which goes so far as to summon persons having trade relations with Jews to give an explanation of their conduct. Below will be found a typical cutting from a Polish newspaper giving the name of a Polish countess who sold property to Jews. This was surrounded by a mourning border such as is usual in Poland in making announcements of death.

(translation)

"Countess Anna Jablonowska, resident in Galicia, has sold her two houses, Stryjska street, Nos. 18 and 20, to the Jews, Dogilewski, Hubner and Erbsen. The attorney of the countess was Dr. Dziedzic; her administrator, M. Naszkowski. Will the Polish public forever remain indifferent and passive in such cases?"

This illustration of Sir Stuart brings to mind a practice common in England. It is related on page 123 of "The Conquering Jew," by John Foster Fraser, published by Funk and Wagnalls, New York, 1916: "The housing question in the Whitechapel district has reached such a pitch that there are large blocks of buildings where 'No English Need Apply' is a common legend. Whole streets are being bought up by Hebrew syndicates, whose first act is to serve notice on all Gentile tenants."

It is also worth stating in this connection, that some of the feeling which has recently led to race riots in American cities has been engendered by the practice of small Jewish real estate syndicates purchasing a house in the middle of a desirable block, ousting the tenants and installing a Negro family, thereby using race prejudice to depreciate the property in the entire block and render it purchasable by the Jews at a low price. Thereafter the property is lost to Gentile ownership or use.

It may be that in Poland a similar condition exists which makes the sale of property into Jewish hands a kind of disloyalty to the people generally. Apparently the Poles think so. "Racial prejudice" is not a sufficient explanation of such beliefs: there is always something pretty tangible beneath them.

The "boycott" was merely this: an agreement among Poles to trade with Poles. The Jews were numerous, well-to-do, and in control of all the channels of business. They own practically all the real estate in Warsaw. The Jews claimed that the so-called boycott (the Polish name for it is "the co-operatives") was "persecution."

Sir H. Rumbold—"It must be further remembered that under the influence of economic changes and owing to the fact that since 1832 the Poles have not been allowed to hold posts in the government, they were gradually obliged to take to trade, and competition between the Jewish population and the Poles commenced. This competition became stronger when the Russian Government allowed co-operative and agricultural societies to be started in Poland. The co-operative movement is becoming very strong and will undoubtedly form an important factor in the development of economic relations in Poland, so that indirectly it will be bound to affect the position of the small Jewish trader.

"In so far as the Polish Government are able to do so by legislation or proclamations, the boycotting of the Jews should be prohibited. But I would point out that *it is beyond the power of any government to force its subjects to deal with persons with whom they do not wish to deal.*"

Henry Morgenthau, however, takes a more reasonable view than his British co-religionist, Sir Stuart Samuel. Mr. Morgenthau says:

"Furthermore, the establishment of co-operative stores is claimed by many Jewish traders to be a form of discrimination. It would seem, however, that *this movement is a legitimate effort* to restrict the activities and therefore the profits of the middleman. Unfortunately, when these stores were introduced into Poland, they were advertised as a means of eliminating the Jewish trader. The Jews have, therefore, been caused to feel that the establishment of co-operatives is an attack upon themselves. While the establishment and the maintenance of co-operatives may have been influenced by anti-Semitic sentiment, *this is a form of economic activity which any community is perfectly entitled to pursue.*"

It is not difficult, therefore, to see through the eyes and minds of these five men the situation that prevailed in Poland. Eight hundred years ago, Poland opened her gates to the persecuted Jews in all Europe. They flocked there and enjoyed complete freedom; they were even allowed to form a "state within a state," governing themselves in all Jewish matters and doing business with the Polish Government only through their own chosen spokesmen and representatives. The Polish people were their friends, evincing neither religious nor racial antipathy to them. Then Europe fell upon Poland, divided her asunder, until in the roster of the nations there was no more Poland, except in the hearts of the Polish people. During this period of Poland's humiliation, the Jews grew to be a mighty power, ruling the Poles, regulating their very lives. The Great War came with its promise of liberation and the restoration of a Polish free government. The Jews were not favorable to that restoration. They were not Poland's friends. The Poles resented this and at the signing of the armistice when they were free to express their resentment, they did so. Many regrettable things occurred, but they were not unintelligible. They had explanatory backgrounds. Even the armistice was not the end. The Bolsheviks from Russia came down upon Poland, and once more, so the Poles strongly declare, the Jews were against the land that had sheltered them for 800 years.

These are a few of the facts. Another article will be required to complete the story. In the meantime enough has been said to show the utter wrong which Jewish propaganda in the United States has done to Poland. But the purpose was not altogether to injure Poland; it was also to blind the American people, and cause them to view with equanimity the great influx of those same Jews into this country.

A book containing over 200 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Another dastardly outbreak of anti-Semitism has been discovered—Jewish Christians ask permission to live in Palestine! Think of it! In *The Scribe,* a Jewish publication of Portland, Oregon, is an editorial entitled, "Hebrew Christians." It is very instructive. It reads in part: "Albinos are generally objects of pitying animosity. Dime museums used to advertise dismal hybrids to attract the curious. Some forms of religious enterprise still go in for this sort of thing and send about the country Jews hired to dress and talk like Christians. It is one of the most appalling sensations to hear one of these obvious brothers of Gideon calmly banter the bond beliefs in the salvationist theory of our day. It gives one a sickish feeling. When one realizes that he does it to make a living, one pities a fellow Jew who has to carry such a heavy cross. One Mark John Levy has been hectoring the Jewish Congress. He importunes it to allow Hebrew Christians to live and be a part of the Palestine nation. Mr. Levy is naturally not at all sincere in his request. He knows that a maverick like that will be as much in place in Zion as a Jewish doctor ushering in a Christian Science church. What he really wants is to show off and to issue proclamations and to make himself solid with the superannuated celibates who are putting up the money for his salary and expenses. He badgered B. G. Richards into writing him a polite and formal note, and he published it. As a sample of how polite B. G. R. can be, it is great and I will say welcome, and it also tells Mark to get up and not clutter up the doorstep with his trash. He wants to contribute to the congress. He is refused the privilege. He wants to live in Palestine . . . ." The rest of the editorial, very coarse in its allusion to Christianity, is reserved to a future time. For the present, it is sufficient to know that Hebrew Christians are not wanted in the Hebrew nation.

At a secret meeting of Jewish leaders which was held at Chicago to discuss THE DEARBORN INDEPENDENT'S series of Jewish articles, it was decided to employ a large committee of scholars, regardless of race or religion, to attempt some offset to the articles.

"In Rumania the Jews of Bessarabia receive special 'emigration' passports, which, without taking the responsibility of declaring the bearers to be Rumanian subjects, give them the right to leave the country. These special passports are accepted by the American authorities. The American consulate in Warsaw gives visés to about 5,000 Polish Jews a month, and the consulate in Bucharest gives visés to about 1,000 Bessarabian Jews."—Chicago *News.*

One thousand "Hebrew Brothers" met in New York, October 17, and considered THE DEARBORN INDEPENDENT'S articles. They appointed a committee of five to attend the next session of Congress and urge the passage of a law against that paper.

Herewith is presented the contribution of one prominent American rabbi to the study of the Jewish Question—"insult," "psychic disturbance," "clumsy," "stupid," "libel," "screed," "contents of old garbage pails," "abysmal ignorance," "malignity," "forgery," "abominably false," "dastardly," "defamation," "skulking," "pogromism," "hooligan," "columny."

Henry Morgenthau made $500 political campaign contributions for himself and each of his 11 grandchildren.

Rev. Dr. John Haynes Holmes, of New York, recently preached a sermon denouncing the articles in THE DEARBORN INDEPENDENT. The church in which this clergyman preached was for years known as The Church of The Messiah. He expunged the name of "Messiah" and selected a Jewish rabbi to become associate editor with him on *Unity,* a paper formerly edited by Jenkin Lloyd Jones, of Chicago.

At Ellis Island, more than 6,000 immigrants are detained on account of disease. With few exceptions they are Jews from Poland.

Shackling the Flood Devils of the Miami

THE eyes of the engineering world are turned today toward the Miami Valley of Ohio, where there is being carried on the greatest flood protection project under construction in any part of the world. Engineers have come from China and Japan, from almost every country of Europe, from South America and from all corners of our own United States to study the materialization of the ingenious plans, formulated by the greatest engineering talent of this country, to save one of the most fertile of America's garden spots from the horrors and losses of the great floods which have so often laid it waste.

Although the impelling motive which fostered the creation of the Miami Conservancy District and the work which is being done under its authority was the great flood of 1913, the valley has always been subject to disasters of this kind and has been swept time and again by disastrous periods of high water. The records show that there has been a great flood in the Miami region at least once in every ten years and that on many other occasions the water has been high enough to cause great loss throughout the rural districts.

The Miami drainage basin lies in Southwestern Ohio. It has an area of 4,000 square miles, including all or parts of 15 counties, eight cities or villages and thousands of highly developed and very productive farms. The chief tributary streams of the Miami River are Mad River, Stillwater River, Four Mile Creek, Twin Creek and Loramie Creek. The Miami is something over 150 miles long, extending from the Lewiston reservoir to a point 20 miles below Cincinnati where it joins the Ohio.

Dayton, the principal city, lies just below the confluence of the Stillwater, Mad and Miami rivers while Hamilton is in a still more vulnerable position since Twin Creek, which is a vicious stream in the time of heavy rains, empties into the Miami River above the city and adds greatly to the flood problem of this community.

Excessive rainfall in the valley is always the forerunner of flood waters. This is due partially to the soil composition and partially to the exceedingly large number of drainage ditches which, while they improve thousands of acres of land, carry the water off very rapidly and turn the normally placid tributary streams of the main river to raging torrents overnight. The bed of the Miami is not proportioned to care for excessive discharges and the natural result is that even a moderate flood causes it to overflow its banks and spread across the lowlands, while any such flow as that experienced during the several high water periods of the valley's history always results in great damage.

The first agitation for flood prevention works arose in the cities of Hamilton and Dayton and both of these communities summoned experts to study the situation with the view to making channel improvements which would carry the flood waters by. In the course of the surveys it was discovered that while this method promised the earliest results it was not an adequate solution of the problem. In the first place the river channels in and about the cities had a capacity of only 33 per cent of the 1913 flood, and the work of enlarging them meant the expenditure of millions of dollars in grade changes, the construction of levees and bridges and the destruction of a vast amount of highly developed property.

In addition to this feature, it was apparent that such channel improvements would offer no protection to the valley at large but would merely serve to hurry the waters through the cities and spread them upon the defenseless agricultural lands. Enlargement of the channel throughout the entire valley was not practical because it would mean a 90 per cent addition to the present river bed for a distance of approximately 150 miles, an expense which would be prohibitive.

The cities, considering all of these things, decided to sacrifice their immediate safety for the sake of safeguarding the whole valley through some comprehensive plan of flood prevention and instructed their engineers to make studies to that end. The people were quite well aware, when they took this step, that it meant a delay in safeguarding their own interests and that it meant also they would bear a heavy burden of taxes for improvements spent in protecting property other than their own. It is to their everlasting credit that they chose the big and the broad way, restraining their impatience to see dirt flying immediately and counting the community gain rather than the private cost.

The plan finally recommended and adopted consists of a series of five retarding basins or reservoirs formed by building dams across the valleys of the Miami and its tributaries. There are permanent conduits in the base of the dams through which the streams flow at their normal rate in ordinary times.

The theory of the project is that when heavy rainfalls create a flood and the rivers rise these conduits will permit the water to pass downstream only as rapidly as the river channels can accommodate it while all in excess of this will accumulate in the retarding basins behind the dams. The result will be that a flood like that of 1913, in which almost one and one-half million acre feet of water rushed down the valley in four days, will now be held back by the dams, stored in the reservoirs and released gradually over a period of two weeks or more.

These five reservoirs will have a capacity of 900,000 acre feet of water (an acre foot is the amount of water necessary to cover one acre of land to the depth of one foot) or 60 per cent of the total amount of water that passed down the valley in the flood of 1913. This, with the discharging capacity of the permanent conduits at the base of the dam, will enable the retarding basins to control a flood 40 per cent greater than that of 1913, assuring what the engineers believe to be an adequate margin of safety under any possible conditions.

There were several factors favorable to such a plan as this. One was the existence of natural basins in the valleys, another was the fact that the composition of the soil was excellent for the construction of earth dams and a third was the presence of natural foundations of bedrock at strategic points for the construction of spillways and conduits.

The finest engineering talent of the country was summoned to the valley to test the theory of this plan, and before a single dollar had been spent on equipment or the first dirt thrown, the District had received repeated assurances that it was on the right road.

Practically five years were spent in developing the plans on which the work of construction is now proceeding, or about a year longer than it is expected the actual work of building will consume. "Make sure you're right then go ahead," was the motto of the board of directors and nothing could move them from that position. Time has proved that not a day of their deliberations was wasted because the time devoted to surveys and planning made it possible to gather a picked corps of experienced engineers, to build up the nucleus of a construction force and to determine exactly what equipment would be necessary to carry on the work. Consequently when construction work started in earnest it struck and held a pace which has shattered all previous records in tasks of this kind.

The dams, which are the most imposing part of the work to a layman because of their great size, are being built along lines developed during a long and careful study. The causes of failure in 200 dams built in the past were thoroughly analyzed and every care taken to profit by these lessons and to insure works which would stand for all time.

It may not carry much significance to the lay mind to say that nine million yards of earth and 190,000 yards of concrete will be used in the five dams and their appurtenances, but there should be no difficulty in visualizing these figures when it is explained that the lowest of the five dams is 65 feet high and 3,340 feet long while the crest of the highest dam is 120 feet above the valley and 4,660 feet in length. All the dams are 25 feet wide at the top and their crests will be used for highways. Their thickness at the valley level varies, the Huffman dam being 380 feet wide at its base, while the Englewood dam has more than three times that breadth. The outer surfaces of the slopes will be covered with soil and planted to grass and hardy shrubs. Paved gutters will care for rainfall in a manner which will preclude any danger from erosion.

The hydraulic fill method has been adopted in the building of the dams as being both superior to and more economical than the older method of roll fill. One of its advantages is that the bulk of the work is done by machinery and this is immediately noticeable to the observer who visits one of these giant works for the first time. There are fewer men in sight on the Englewood dam, which is the largest of the five, than one may sometimes see on a stretch of state road under process of construction.

The process on the Englewood dam, which is followed with small variations on all the other barriers that are being thrown across the valleys, is interesting and is easily grasped. Construction cars are filled with earth at a point above the dam known as the "borrow pit" and this material is then hauled to a position alongside the dam and dumped into a so-called "hog box" where it is washed down by hydraulic streams into a revolving "grizzly" or screen. In the screen the large stones are thrown out while the earth and gravel sifts through and is carried by the water into great pumps which hurl their contents through lines of steel pipes.

Converging streams from these pipes work from each side of the dam. The gravel being heaviest falls and comes to rest soonest while the sand and clay is carried in toward the heart of the structure and settles so that with the passing off of the water there is left an impervious core, which is flanked on each side by thick walls of stone and gravel. Thus the dam, at one operation, is endowed with both imperviousness and strength, the two qualities which are absolutely essential in a work of this kind.

If six hundred men with teams could be placed on one dam and worked to the limit of their strength they could not deliver as much material as these two pipelines are capable of doing. Rather significant of the spirit of the whole work is the way in which the valley has harnessed its ancient enemy and put it at work in defense of the lands it once despoiled.

Next to the dams themselves the feature of the work which is of the greatest interest lies in the massive concrete outlet structures. At three of the dams the outlet works and spillways are combined and at the remaining two they are completely separated but in all cases the principle of the outlets is the same. It is not believed by the engineers that the spillways will ever be necessary, but the conduits are the key of the whole project.

It is necessary that these openings, which are permanent and without gates, must be kept open, and to prevent floating masses of timber from obstructing them rows of concrete piers are to be built in the stream above while booms strongly anchored to masonry will also assist in holding back drifting debris. To prevent erosion by water, the bed of the stream as well as the toe and the slopes of the dam near the entrance to the conduits will be paved with stone.

Below the downstream end of the conduits there is built what the engineers know as a hydraulic jump. This is, in effect, an artificial channel of concrete and is constructed with a view to destroying the terrific force with which the water leaves the conduits under the heavy head developed in the retarding basins. This ingenious plan was worked out in actual detail upon small models before being adopted. As the stream is shot forth from the conduits at a rate as high as 60 feet a second, it whirls down a series of irregular steps, plunges into a deep pool of comparatively still water and almost simultaneously dashes against a massive 15-foot concrete wall and throws up a standing wave of considerable height and volume. Leaping this barrier the water falls into another pool and again strikes a strong wall which throws it into the air a second time. So thoroughly has the current been broken by this time and so greatly has its strength been dissipated in foam and spray that it leaves the last barrier comparatively tame, flowing steadily and powerfully to be sure but minus the wild velocity it possessed when it boiled forth from the conduits only a hundred feet back.

It is estimated that a flood 40 per cent greater than the one of 1913 would cover 35,600 acres of territory behind the five dams. In the beginning it was hoped that easements could be procured for a reasonable fee that would give the district the right to flood those acres which lie in the retarding basins. The owners, however, asked such a high price for the easements that the district decided it would be cheaper to buy most of the land and accordingly purchased 35,000 acres. This has since proved to be one of the best investments of the entire project. The land, lying mostly in the river bottoms, is the richest of the valley and the district lost no time in employing a farm manager and a force of men to work its new fields. Some of the remaining land has been leased, there being about 100 acres which are renting for $100 an acre while several farms have been resold at a profit to the district. The prospect seems to be that the district, because of its foresight in purchasing this land will not only make considerable profit on its holdings, but will have all the flood rights necessary and in addition to this will be richer by the creation of several hundred acres of beautiful park property along the banks of the little lakes which will be formed at four points in the valley.

It has been shown that instead of impoverishing the lands in the reservoirs the dams will be a positive benefit and will make them even richer than they are today. In the past the floods have frequently destroyed large sections of valuable farming land. In some instances the waters stripped off the top soil and in others it buried the fields under deposits of rock and gravel. In both cases the land was made useless for agricultural purposes. Now, however, with the flood waters held back by the dams and lying in comparative quiet, the rich silt which they carry will be deposited on all those acres within the retaining basins.

The benefits to be derived from this protection by 75,000 pieces of property were estimated by the board of appraisers to amount to $75,000,000. This estimate became the basis of a 30-year bond issue from which $35,000,000 was realized. Of this amount Dayton and Hamilton stand by far the greater share.

In the agricultural districts only those lands which receive a direct benefit from the flood prevention work are taxed. The cities, however, pay a general flood prevention tax and in addition to this, the owners of property which receives protection pay an additional

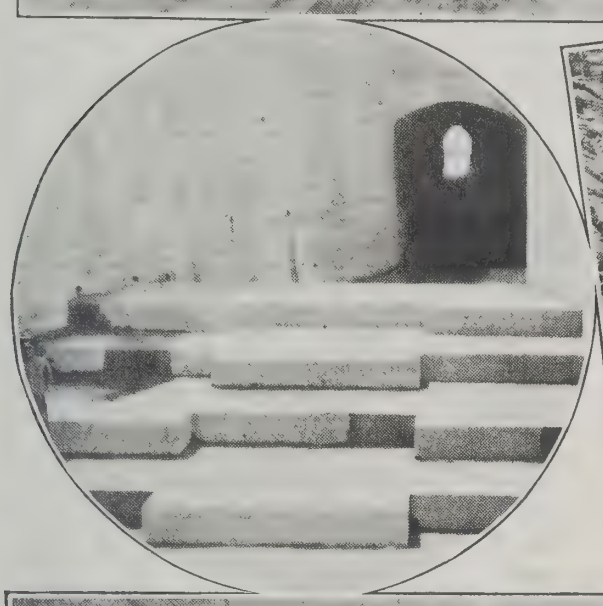
(Concluded on page 15)

BRIEF PARAGRAPHS ON GREAT PROJECT

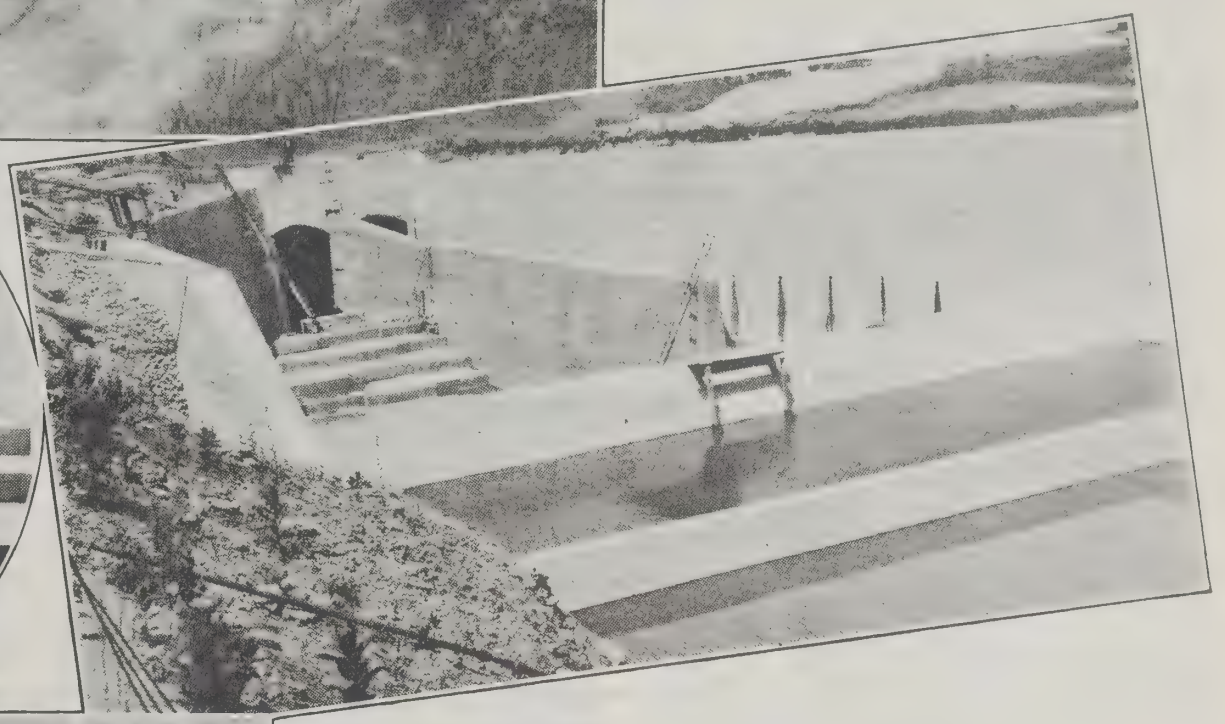
The greatest flood prevention work of the kind ever attempted in the United States.

To cost $35,000,000 when completed in 1922.

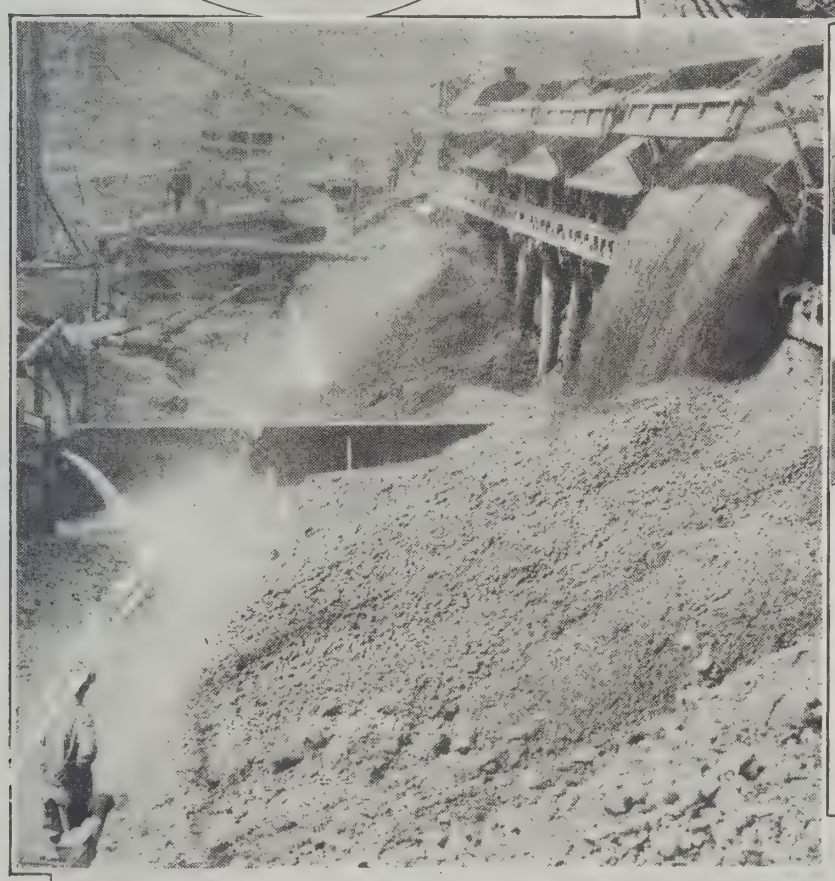
District extends up the Miami Valley 100 miles, contains 8 cities and includes parts of 9 counties.



Project consists of five great dams and retarding basins supplemented by channel improvements in the cities and at other strategic points.



Permanent concrete conduits at base of dams are so proportioned that no more water can pass through them than river channels will carry away. All flood water in excess of this will be held by dams in retarding basins, and will run off gradually.



When construction is finished a flood 40 per cent greater than that of 1913 will flood one-third less territory. The 1913 flood did $100,000,000 damage in cities. A similar flow of water now will cover only the farm lands and will enrich instead of despoiling the valley.

Fitting the Fetters on an Ancient Enemy

The photograph in the upper left hand corner shows flood waters passing through the conduits of the Germantown dam. Immediately under this are two views of the conduits and the hydraulic jump. Below are two photos showing processes in the building of the earthen dams, described in the article on the opposite page. The photograph at the bottom gives an impression of the massiveness of the dams.

All England One Great Laboratory

By W. P. CROZIER

Manchester, England, October—(By Mail).

ONE could record a good many injuries that the war has inflicted on us, not only material but moral. War is an ugly thing, a method of barbarism, whatever be the heroic virtues which it evokes, and it would be a miracle if the vices of the barbaric character, like greed and violence as a means to acquisition, did not follow in its train. But there are some things on the credit side in this country and among them the recognition, bred at the time when our fate hung in the balance, of how much we stand to gain by scientific research work into the principles which lie at the base of every industry and the application of them to the processes of manufacture.

Of course there was a good deal of important research work done in this country before the war but it was generally admitted that we were outdistanced in this respect by both the United States and Germany. Nor was there much doubt about the reason. The individual British manufacturer was too conservative in his ideas and too anxious to see quick returns on expenditure to be enthusiastic about scientific research, especially in the broader forms in which he could not see the likelihood of profit by the immediate application to his own particular concern of the results to be obtained. Further, there was on the part of the smaller concerns a sense of independence and a trade jealousy that prevented the co-operation which would have made possible research on a large scale. There were, of course, notable exceptions but on the whole we were in the habit of citing foreign example with regret and envy, especially the German research work in chemistry which had built up a great dye industry, based originally on the discoveries of an Englishman, Perkins, but exploited and developed by foreign enterprise and insight.

The war brought a change. The stimulus was of various kinds. The whole of the technical side of the war—armaments, explosives, equipment—called for the researcher and inventor and forced both the government itself and private enterprise in state service into volcanic activity. Commerce gave a similar impulse. England was shut off from many of the sources of supply for indispensable articles of use. She had to find the means of producing them herself during the war and she was inspired by the incentive that she might produce them afterward, in time of peace instead of her rivals. Necessity and commercial ambition worked together.

The government formed an important committee of our most distinguished men to direct and stimulate research and placed £1,000,000 at its disposal for distribution among the research associations to be established in the various industries. I am aware that $4,000,000 or thereabouts will not seem to be a large sum to the imagination of a country where the benefactions of rich men to the cause of education are conducted on a scale which puts all other peoples to shame, but it should be compared not with the greater that might be done but with the very much less than has been hitherto achieved among us. And the project is succeeding. Eighteen research associations have already been established. Some 2,500 firms have guaranteed them subscriptions for five years, during which they will be assisted by state funds. Some industries are raising a big fund of their own, like the linen trade and the cotton trade, which is aiming at a quarter of a million sterling. What sort of industries, it may be asked, are sufficiently wide-awake to join in this co-operative research? Among recent adherents are manufacturers of rubber and tires, motors and accessories, motorcycles and cycle cars, linen, glass, shale, oil, silk, cutlery, leather and pottery.

Besides, in the cotton trade the formation of a very vigorous research association has been followed by a development which is significant, even though at present small. Five of the Oldham cotton spinning firms have founded scholarships for training students in science and technology, partly under the supervision of the research association of the industry. This principle, were it generally adopted by our industrialists, would lay firmly the foundation of future success in the cotton trade. It is impossible to repeat too often the old tag that Knowledge is Power. The manager of the Oldham cotton mill who has worked his way up from the status of a boy "hand" has never yet been able to understand that the existence and prosperity of the Lancashire cotton trade in home and foreign markets must depend on the scientific study of all its processes. If he is beginning to understand now, if his idea of "education" is at last broadening out, it is a happy sign both for the industry and the nation. Other industries also are waking up. The Woolen Research Association is establishing a small mill purely for the work of research on a manufacturing scale; the cement and the glass industries are experimenting in a similar way with regard to furnace construction and fuel economy. The woolen and cotton trades have established their own institutes; so has the linen industry, which is experimenting near Belfast in the cultivation of flax; the glass and the cocoa, chocolate and jam trades are establishing their own research laboratories. Such investigations may not have their results all at once, but assisted by the more fundamental research work, which is being done by other hands, results they will have eventually and those of great advantage to the industries.

This kind of research work, organized by the industries themselves, is only part of the present outburst of activity. The state committee, with a number of allied boards, carries on a large range of separate inquiries. One investigation which is typically important and well worth citing is the work of the Fuel Research Board, which has been investigating the question of fuel for motor transport—a problem which is made more and more urgent by the great increase in motor traffic, the growing demand for commercial vehicles and the rising price of petrol. The public is always talking of the possibility of some cheap substitute for petrol, of which we already need 250,000,000 gallons a year and shall want more and more. The Fuel Research Board has investigated closely the possibilities of power-alcohol as a substitute for petrol but with no conclusion that is cheering for the motor owner harassed by the constant rise in price.

The price of petrol now is about 4s. 6d. The research board says that power-alcohol for commercial purposes cannot be produced from any vegetable substances in this country because the supply is insufficient, and if it were not, the expense would be prohibitive—even the raw material for a gallon of spirit would cost 7s. in the case of barley, 8s. 6d. for potatoes and 3s. for mangoes. Besides, all such things, whether home-grown or imported, have a higher value of their own as foodstuffs. The board, however, has struck a most interesting line of investigation, of which in the future, near or distant, much may be heard. "In the tropical portions of the Empire there are vast quantities of vegetation of rapid growth forming an enormous reservoir of the sun's radiant energy, affording a practically inexhaustible source of supply of power-alcohol, if a cheap and simple process, either chemical or bacteriological, were available and could be applied commercially on a very large scale. Research work in this direction has been initiated but it must take time . . ."

Meanwhile the research board refers us to coal as the cheapest alternative source of power. The amount of heat that can be obtained for 21s. from petrol at 3s. a gallon would cost 52s. from alcohol at 5s. a gallon, but gas from coal or coke would cost only 3s. or one-seventh of the price of petrol. The difficulty with gas, of course, is that of providing light and safe containers for motor vehicles of all descriptions and establishing refilling stations in sufficient quantity. During the late stages of the war a great many motor vehicles were equipped in this way but the refilling was always a difficulty and the use of gas fuel seems almost to have disappeared. It is likely to grow again if the price of petrol continues to rise and in any event the whole question of fuel for motor transport is obviously one of those on which research work is of most immediate use.

But the activities of the government committee are multifarious. It makes grants to deserving students at the universities and to independent research workers and it aids the proper equipment of research laboratories. The fuel board was impelled by the reports which it received of the use of pulverized coal in the United States to send over an investigator. His report of what he saw has already gone to its second edition and the fuel board at once decided to establish a small pulverizing plant of the latest design for the purposes of its own experiments. That is a small but concrete illustration of the usefulness to industry of our new research organizations.

Another region of inquiry is concerned with the composition and economical use of building materials—a subject which has never before had the importance which it has now, when houses cannot be built because of the lack of bricks and bricklayers and every species of earth material is being tested and tried in the hope that it may prove to be cheap, easily handled and available in large quantities. Perhaps of even greater permanent importance from the national point of view are the inquiries into the means of preserving fish and meat, fruit and vegetables. Even during the hardest times of the war, quantities of foodstuffs went to waste because of the present lack of knowledge of the means of preserving them and at any given moment the same is true today, as when, for instance, a glut of fish is offered to the markets. As a first step a grant is being made to Cambridge University for the establishment of a low-temperature research station. To take one point only, it has hitherto been possible to preserve mutton by freezing, but not beef. The researches of the Food Investigation Board have now discovered a means of freezing beef also without damage, but the experiments have been small, and it remains to obtain results which can be applied on a large industrial scale. When that is done we shall have won an addition to our food resources like that produced by the arrival of frozen mutton.

The study of home-grown timbers, the commercial gas-cylinder, lubricants, the corrosion of metals, the atmospheres of deep and hot mines are among the many subjects of the new research. But it is needless to multiply instances further. I have said enough to show that both state and private industry have begun to awaken to the absolute need of research work if we are to keep abreast of our principal competitors. Industrial researchers and inventors we have always had: in systematic and organized inquiry we have been too backward. Whether we shall now achieve success depends on the sincerity and persistence of our devotion to the task—and of course also on the exertions of our rivals, about which your readers will know more than I.

When an American Woman Can't Vote

Concluded from page 3

few Russians and Swedes. Strangely quiet they all were while we waited a half hour, a whole hour, and fifteen minutes more for the judge to arrive.

A very busy man was he—substituting for the regular judge away vacationing. When he came, he came with a clatter, his clerk following close behind. A genial fellow, that judge, fairly young and bald. It's a mistake for a young judge with a bald head to have a gurgling sense of humor. His judicial dignity is somehow gravely compromised. He reminded me of Humpty Dumpty. He took his seat facing us silent, eager-eyed, rather tired-of-waiting would-be citizens. At his right, the clerk was by this time busily rustling papers, and calling out in a monotone: "Number 6437802, Jonassi Marconorazzi!" A shuffling of feet followed and Number 6437802, Jonassi Marconorazzi and his witnesses approached the stand. They were sworn in. The petitioner took the stand to the left of the judge.

Now the examiner ceased his aimless wanderings about the room, took his place before the judge. He turned first to the witnesses.

"Your name, sir?"

"Where were you born?"

"Since what date have you known the petitioner?"

"Ever since that date, during all that time, do you know him to have lived here, to be of good moral character, and attached to the principles of the Constitution of the United States?"

Attention was then turned full force on the petitioner himself. Poor soul, little he knew what was in store for him. His turbulent, volcanic self took possession of the examiner. He snapped out his questions. Of all the rudeness!

"Have you read the Constitution?"

"Are you married?"

"Living with your wife?"

"Why not?"

"Who is Woodrow Wilson?"

"Who are the Senators from California?"

"Who makes the laws of San Francisco?"

"If we got into a war with Italy and you had five brothers fighting in the Italian Army, would you fight for the United States?"

"Sure?"

"Ever been arrested?"

"All right! Granted! Next!"

The questions didn't sound so offensive, and each man had a somewhat different set hurled at him. Indeed they were not too offensive. It was the judge who made me furious. His elbows on his desk, he rested his bald, fat, empty head in his hands—his good-natured face showing nothing but whole-hearted delight in the amusement he found in the applicant's answers. "Haw! Haw! Haw!" he would roar out and slap his clerk on the shoulder. Can you imagine greater discourtesy and rudeness?

Well, the farce continued. Numbers and names were called. Men took their places. Questioned, ridiculed, dismissed. The ridicule was in direct proportion to their shabbiness of dress, and haltingness of speech. The cruelty, the snobbery of it! It brought to mind a recent cartoon of Tony Sarg's entitled, "We'll Americanize You Yet."

On leaving the stand the petitioner proceeded to the clerk and side by side they stood with their right hands half-heartedly raised. As a matter of fact the clerk was leaning half over his desk, left elbow resting on it. The "ex-foreigner" was saying, "Yes, yes, yes." Then it dawned on me that the jumbled sounds the clerk was mumbling at breakneck speed was the oath of allegiance. I'd never have recognized it, though I knew it by heart.

Now, by the taking of that oath, that foreigner's wife, probably illiterate, and his minor children also became American citizens! Granted the same privileges that had been snatched away from me, an American-born, a university graduate, a recent teacher in our public schools!

That foreigner, in fact any *man* who is a citizen, has the power of conferring citizenship by adoption. Moore's International Law Digest tells us: "The only mode of adoption by which a private person can confer citizenship upon an alien is that of marrying a female of foreign birth." He is limited, though, in the matter of increasing his family by adoption, for "citizenship cannot be conferred on an alien child by adoption by an American citizen." Still, by the Act of 1901, when "an alien woman marries an American citizen, *her* minor children become citizens by virtue of her acquired citizenship."

Back again to my own story. Time had slipped away faster than we had anticipated, and unless Will's case was called soon, he was going to be late to an urgent engagement. So I, not being needed, slipped away to telephone a message for him. In a few minutes I was back at the court room door, anxious not to miss Will's case.

The bailiff held the door open for me, saying—but my eyes caught Will and his witnesses already on the stand. My ears heard not the bailiff but the examiner: "Your Honor, I am familiar with this case. Everything is O. K." No questioning at all.

That was all. Will was an American citizen and receiving the congratulations of the judge. I was no longer a subject of King George.

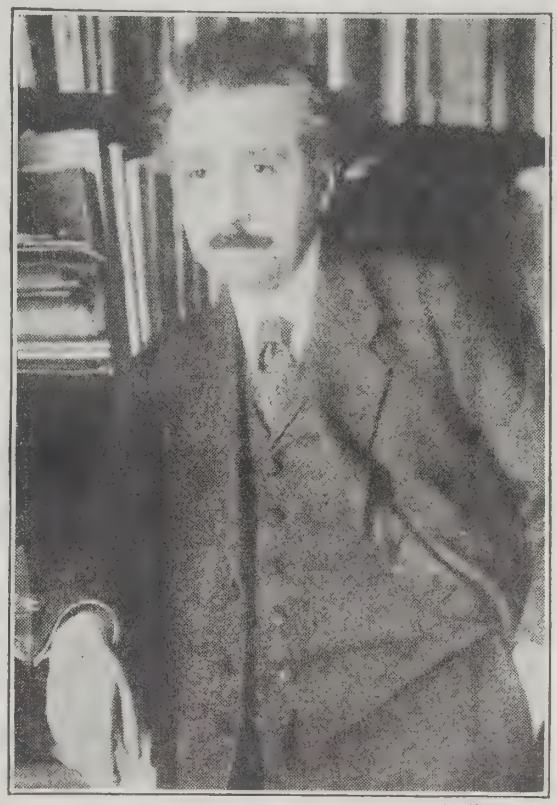
Einstein Theory Causes Scientific War

IF THE United States were helplessly in debt, its people half starved, its government shaky, its industries crippled, and if it owed a huge foreign indemnity for the collection of which alien armies camped on its soil, it would be hard to picture anyone paying attention to the grave problem of whether light rays are bent on entering a gravitational area. Much less would it be imaginable that newspapers should give the pros and cons columns of space and that mobs should form over the matter.

That is roughly what is happening in Germany, and Albert Einstein is the cause of it all. Einstein is the founder of the theory of relativity which is so abstruse that only twelve men in the world are said to be capable of understanding it thoroughly. Seemingly many more have grasped it in Germany, for his theory is now the center of a gigantic debate, with hosts of partisans on both sides, hard words passed and rougher words lurking in the background.

This could happen nowhere but in Germany, where the study of science, in fact any study, has always been more controversial than anywhere else and where thousands have taken sides on questions of pure knowledge which they themselves did not understand. In fact it has been claimed that Germans have spent their lives in difficult study solely to be able, at the end, to say to some professorial college, "There, I told you that you were all wrong."

The Einstein Battle rages fiercely. Paul Weyland, his chief antagonist, in an opening statement called the distinguished theorist a "ruthless manufacturer of mathematical fiction," and his chief followers, "chalk physicists." These were hard words, and duly reported in the papers.



Some of Einstein's journalistic supporters seem to be much at sea as to his theory, but insist he must be all right because otherwise the Swedish savants would not have given him the Nobel prize. This is rather good reasoning at that, and doubtless serves a multitude of supporters who do not know or care whether an object viewed from a moving body traveling in the direction of the light rays is larger or smaller or neither.

Einstein is popular in many quarters because he is a German who has, despite the ill opinion formed of Germans during the war, compelled the recognition of foreigners. With others he is unpopular because of his alleged pacific attitude during the war, and all this adds to the general jollity.

Battle has been largely joined over three points of his theory: One his dictum that light rays are bent on entering an area of gravitation, another his deductions from the variations of the orbit of the planet Mercury, a third his deductions and theories on the red rays of the spectrum. These are abstruse matters and quite beyond the ken of the ordinarily well educated.

It seems to matter very little whether it is as Einstein says that the ray bending was proved by observations during the eclipse of the sun in 1914, or whether the truth is with his opponents who claim that he observed the effect of the sun's corona. Whether the Einstein theory or the Newtonian law accounts for Mercury is a thing over which few Americans will lose sleep.

Nevertheless they enrage and excite Germany. When Weyland and Professon Gehrke, the shock troops of

(C) Keystone

PROFESSOR ALBERT EINSTEIN

the opposition, opened the battle at Philharmonic Hall in Berlin, the hall was packed. The renowned relativist was in a box with his daughter, taking the attacks calmly, even smiling now and then.

Herr Weyland fired first. He announced that he had come to explode the "Einstein fiction," but was criticized for not explaining what this fiction was, the audience standing sorely in need of finding out exactly what Einstein meant. He then attacked the newspapers and the scientific press for advertising the theory.

Supporters of Professor Einstein began to scream at him, "Get to the facts," and the speaker demanded that these disturbers be, "put into the air."

Finally he called Einstein and his followers scientific Dadaists, and concluded that his ideas were all wrong and anyhow he had stolen his notion of Mercury.

Professor Gehrke made a better impression. He outlined the Einstein theory, said it was a brilliant intellectual feat, but useless. He proceeded to show that Professor Einstein had altered his theory since first announced. He was a humorous speaker, and received a good reception.

In the end, however, he said that the Einstein theory was not the Einstein theory at all, but had been printed in a book by a Hungarian writer, Palagyni, in 1901.

This should have ended a pleasant evening, but after the meeting a number of students chased Professor Einstein home and threatened to cut his throat. This was not the first mix-up that he has had with the students, mostly ardent German Nationalists and militarists, who were annoyed by his politics. Earlier in the year they broke up several of his lectures because it had been arranged that they should be free to the public. This the students, who had paid the university fees, declared was unfair and eventually by means of bringing fish horns to the lectures won their point.

Of course at the meeting, Professor Einstein had no chance, but next day he had his innings. He threatened to leave Berlin flat if any more trouble ensued.

"I seem to myself," he said, "like a person who lies in a comfortable bed but is plagued by bedbugs. My closer colleagues have treated me with all possible consideration. For some months, however, since the announcement of the English eclipse expedition, which substantiated my theories, I have been attacked by certain persons on non-scientific grounds, and in the end I wish peace."

He does not shrink from criticism, he said, and this was shown by the fact that he had himself asked the scientists for discussion of his theory of relativity. Then he grew angrier and said that the explanations of Dr. Gerber as to Mercury were not explanations at all. That was also true of the work of others in the red rays of the spectrum.

Moreover, said Professor Einstein, he had never heard of Palagyni and did not read Hungarian.

Altogether, the controversy threatens to go on for at least two years and then take a new lease of life. Two years is set as the time in which observatories in England and Germany, now testing the theory of relativity, can make a report. Meanwhile the professor and his opponents must call each other names on the basis of pure reason.

Taking Books to the Farm in Auto Libraries

SOME bright man (or was it a woman?) has at last realized that long rows of books neatly stored away on hundreds of gloomy looking shelves in town and city public libraries are about as useful to the masses of people as unsheared wool, unpicked cotton, or undug spuds.

Thousands of dusty volumes are being resurrected from their places of burial in ornate-fronted libraries and sent out into the rural districts where live the sort of people who are not only hungry for something to read, but who will satisfy such appetite if given the opportunity. Country folk, you know, are not burdened with the all-consuming problem of spending their evenings Movie-ing, Shimmy-ing, Dansant-ing or Chop-suey-ing.

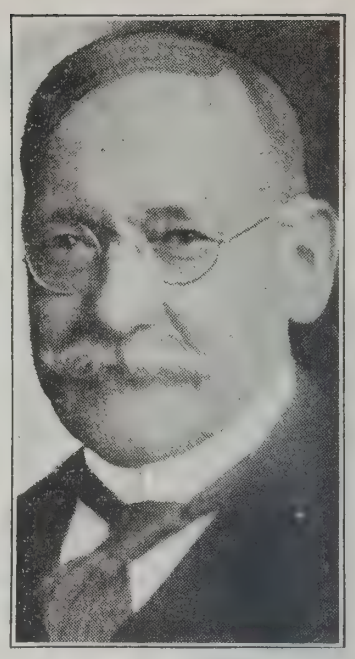
Realizing the voracious book appetite of country people, the American Library Association is busily engaged in blazing the way for city and county libraries to adopt this new system. Library officials are having constructed special automobiles which have facilities for carrying hundreds of books and magazines. With capable young women in charge these "library autos" are sent out on the side roads of the country districts, away from the main arteries of traffic, where they stop at each farmhouse and give father, mother and all the children full opportunity to select the kind of publications that appeal to their individual fancies.

Maryland, Delaware and Minnesota are taking the lead in this new line of educational and country-satisfying work, and the results are said to be more satisfactory than the backers of the movement ever dreamed would be the case.

On "Library Auto" day children can be seen perched on the fences all along the route eagerly awaiting the coming of the "nice book girl" in her wonderful fairy-like machine. Mothers, busy with baking, washing, mending, cooking, cleaning and dozens of other household duties, stop for a few moments every now and then, and going to the front door, look far down the road for dust signs indicating the approach of the book wagon. Of course some one will ask, "Why go to all this bother and expense taking books out to the country? Why not let the country people come in to town and get them? We (Mr. Carnegie and ourselves) have erected these big beautiful libraries, and they surely ought to show a little appreciation by coming to them for their books."

There are two answers to this question. One is that the rural resident cannot drop in at the library any time he pleases. Such a visit often means an inconvenient trip of 10 miles or more. The second answer is that whereas the average individual finds it hard, and sometimes impossible, to browse among the shelves of the modern library, he can make himself completely at home among the more modest supply of books in the auto libraries.

Country people getting books from the "Auto Library."



When the rolling bookshelves draw up at the farmyard gate the librarian merely unfastens the doors on the side of her truck and there you are—all the treasures of romance, adventure, science and history at your fingertips.

There, in the sunshine of the road, before your home or standing in the shadow of your big maples, the library is robbed of all its mystery. The librarian turns out to be a very human person who likes doughnuts and cider and apples and who is only too willing to chat with you and to make helpful suggestions.

The plan should work splendidly in the rural communities and if it does, the librarians who conceived it will have done something well worth while for rural America.

A Crisis in the Farm Loan System

By W. W. FLANNAGAN

W. W. FLANNAGAN

W. W. Flannagan is a Virginian, and as such is a fighter and a fair one. He has a real story to tell about a fight which interests every farmer, and therefore every other man in the United States. Flannagan is on the side of the farmer and the man who eats the food the farmer raises. That's everybody. He has been "up against" the powers that want to keep both the raisers and consumers of food in their strong financial grip. Flannagan believes that grip should be struck off.

A PENDING case in the Supreme Court of the United States entitled *Charles E. Smith* vs. *Kansas City Title and Trust Company* is attracting much attention from its present, and what may become its far-reaching effects upon the agricultural interests of the country.

The suit in question was brought in the Federal Circuit Court at Kansas City, Kansas, to test the constitutionality of the Farm Loan Act, and was inspired by the Farm Mortgage Bankers Association of America. Smith, the plaintiff, is a stockholder in the title and trust company named, and this company was alleged to have had under consideration an investment in Farm Loan bonds which, under the Farm Loan Act, are declared to be "instrumentalities of the government," and as such exempted from all taxation. Smith procured an injunction to prevent such investment. The Federal Land Bank at Wichita and the First Joint Stock Land Bank of Chicago which issue such bonds, intervened, and the Circuit Court promptly dissolved the injunction, from which the plaintiff appealed to the United States Supreme Court.

The case was argued at Washington by eminent counsel early in January of this year, the Federal Land Banks being represented by ex-Justice Charles E. Hughes, the Joint Stock Land Banks by ex-Attorney-General George W. Wickersham and the plaintiff by William M. Bullitt, of Louisville, Kentucky. Without expressing any opinion, in April the court ordered the case restored to the calendar for reargument in October, when the court reconvenes from its summer recess.

The effect of this order was construed by the Farm Loan Board to be the destruction of any market for Farm Loan bonds, and the board ceased to function as to any new business. The banks organized under the Farm Loan Act are dependent upon the sale of Farm Loan bonds for funds to lend to the farmers.

Anticipating such a market through the operation of a banking syndicate of bond dealers, previously employed by the Farm Loan Board, the Federal Land Banks had borrowed from the commercial banks about $15,000,000, pledging Farm Loan bonds as collateral security, and had also approved loans applied for to a much larger amount.

Under these circumstances the Farm Loan Board appealed to Congress to extend for 1920 the operation of a law passed in 1918, which appropriated $100,000,000 for the purchase of Farm Loan bonds, during each of the fiscal years of 1918 and 1919, of which only about $135,000,000 had been so used during the two years. Such legislation would have allowed the purchase of $65,000,000 of bonds and made available that amount for additional loans to farmers. But Secretary Houston, in a letter addressed to the chairman of the House Banking and Currency Committee, objected to this full extension of the operation of the law of 1918, and asked that the purchase of bonds be limited to such bonds as were secured by loans approved prior to March 1, 1920, in which restriction the Farm Loan Board acquiesced, and Congress acted accordingly. The effect of this was that the banks were limited to commitments already made (in amount about $30,000,000) and discontinued all efforts for any new business.

By direction of the board, the banks severally reduced their operating forces to a minimum, and the board itself reduced the number of employes in the bureau at Washington about one-half.

Farm Mortgage Bankers Association

THE Farm Mortgage Bankers Association of America which, as stated, instituted these legal proceedings, consists of dealers in farm mortgages and, prior to the passage of the Farm Loan Act, had a lucrative business in the purchase and sale of such mortgages.

This business consisted in lending money, for periods from three to five years, at the best interest rate obtainable, usually with a commission added, and disposing of these mortgages with or without endorsement, so as to leave a profit in the transaction. In some cases the mortgages taken were pledged with some trust company as collateral security (with the right of substitution), the lender issuing its own collateral trust bonds, bearing a lower rate of interest, against same—the bonds being disposed of to the public. As the farm mortgages usually matured in less than five years, and as the bonds ran for terms of ten to twenty years, the opportunity was given for an increase in the rate of interest with each renewal of the mortgage, and also an additional profit in the way of another commission.

The Farm Mortgage Bankers Association maintains that the maximum interest charge should not be fixed by law at six per cent per annum, claiming that competition properly adjusts this, but fifty and more years of experience has demonstrated the fallacy of such a theory, and that farmers have always heretofore paid "all the traffic will bear." Statistics compiled by the agricultural department show that the average rate of interest on mortgages paid by farmer borrowers throughout the United States, prior to the passage of the Farm Loan Act, was in excess of seven and one-half per cent. In many states of the South and Northwest such rates ran as high as 10 per cent. The lowest rate (included in this average) prevailed in the state of New Hampshire, where rates were 5.3 per cent, due to the fact that farm mortgages there held by savings banks are exempt from state taxation. Under the Farm Loan Act, a uniform rate throughout all the states has been established for farm mortgages, this rate in no case exceeding six per cent per annum; the great majority of loans have been made at five and five and one-half per cent, no commission being charged. A commission charge in addition to interest is a penal offense for any loan made under the Farm Loan Act.

In addition to the uniform reduction of the average rate of interest charged on farm mortgages, during three years the Federal Land Banks have extended benefits to 130,000 farmers by making loans for terms running from 20 to 40 years. All loans are made upon the amortization plan of payment, under which a semi-annual sum (called installment) of $32.50 for each $1,000 borrowed, pays interest at the rate of five and one-half per cent per annum, and also discharges the principal of the debt in 34½ years. The mortgage loan once secured, there is no worry about renewals, and none should exist about the final payment under the small installments required. The borrower has the option of paying off the whole, or any portion, of the debt at any interest period after the expiration of five years.

Land Banks Under Farm Loan Act

THERE are two great separate classes of banks chartered under the Farm Loan Act which have no direct connection with each other, though both are chartered by and under the supervision of the Farm Loan Board. They are known, respectively, as Federal Land Banks and Joint Stock Land Banks.

The Federal Land Banks have restricted territory, in which they can each make loans, which is called a district and consists of several states—except in the case of the state of Texas, which is a district in itself. The country has been divided into twelve districts and one Federal Land Bank is located in each district. These banks are intended to operate exclusively in the interest of the farmer borrowers, who are organized into local associations called National Farm Loan Associations. These associations are the only beneficial stockholders of the Federal Land Banks entitled to vote at shareholders' meetings; the capital stock held by the government can vote, but such stock does not share in dividends.

The other class of land banks, known as Joint Stock Land Banks, are organized with private capital. They are each limited in territory, in which loans can be made, to two contiguous states; they have the same limitation of six per cent as to the rate of interest which may be charged, and are prohibited from any additional commission charge. They are under governmental supervision and subject to official examination. They make loans through agents of their own selection, and have no connection whatever with the farm loan associations.

The loans already made by the twelve Federal Land Banks aggregate about $360,000,000. Some of the loans have been voluntarily paid off in full, and all which have run for one year have been slightly reduced by amortization payments. The principal of the actual amount of loans in force July 31, 1920, is $344,475,809, represented by 124,590 existing borrowers. All borrowers are locally united into Farm Loan Associations which are chartered corporations, and there are now in operation 3,985 of these associations. They are located and doing business in every state of the Union. As there are only about 3,000 counties in the United States, it will be seen that the average is more than one for each county. Through these associations, properly supported and financed, the machinery already exists for carrying out the avowed purpose of the Farm Loan Act, "to provide capital for agricultural development."

They now own $17,404,615 out of the total $24,337,860 capital stock of the Federal Land Banks. The stock originally subscribed by the government, $8,892,130, is being rapidly reduced by additional subscriptions for stock which these associations make, such addition being five per cent of every loan made. The government has already been repaid from this source $2,050,450.

The Federal Land Banks have issued bonds in the amount of $329,600,000. They have sold to the public $152,342,200. The government has purchased $173,285,000 and they have on hand the unsold balance of $3,972,800.

The 29 Joint Stock Land Banks have outstanding loans to farmers in the aggregate amount of $79,406,446; they have issued bonds to the amount of $75,285,000 of which they have sold to the public $59,669,300, the balance on hand being $15,615,700. The government has never purchased any bonds from the Joint Stock Land Banks, nor made any subscription to their capital stock.

The Associated Farm Mortgage Bankers take great credit unto themselves for having "suspended" the business of the land banks. They have a very clever secretary who, on behalf of the association, has for many months been flooding the country—including the members of Congress—with propaganda, seeking to arouse public sentiment against the tax exemption provision of the Farm Loan Act. He maintains that this exemption gives the opportunity for men of large incomes to become "tax-dodgers," through the purchase of Farm Loan bonds, and almost weeps at the distressing loss to the United States Treasury thereby. The question of the loss of public revenue, by freedom from taxation of municipal securities, of insurance company assets, of Federal Reserve Banks, and of all other exemptions, does not seem to disturb him. If he can only save to the Treasury the "farthing" income a tax on Farm Loan bonds might yield, he will rest content with the "pound" loss to Uncle Sam from all other exempted securities. Of course, everybody sees through this sham anxiety, and understands the selfish interest which prompts the procedure.

With the wonderful amount of good already accomplished under the provisions of the Farm Loan Act, more beneficial to the farming interests in the short period of its existence than its most ardent supporters ever anticipated possible, it seems inconceivable that its enemies attacking it from purely selfish motives will be allowed to destroy it. *Nor are the supposed friends of the Farm Loan Board free from criticism. To rest supinely quiescent, drawing full salaries, and doing nothing constructive, pending the decision of the Supreme Court, cannot be considered commendable leadership.* Whether the decision of the court is favorable to the banks or unfavorable, there is no foresight displayed in the way of some suggested method for securing funds for the continuation of "providing capital for agricultural development," through additional legislation or otherwise. A favorable decision creates no market for five per cent bonds through a bankers' bond selling syndicate, this being the only method heretofore adopted by the board for disposing of Farm Loan bonds, except to ask Congress for an appropriation for their purchase.

The method of a bankers' bond selling syndicate, as employed by the Farm Loan Board on behalf of the Federal Land Banks—for the purpose of distribution, must be considered a failure when the figures show that out of the total bonds issued less than 47 per cent has been marketed under such arrangements. The Joint Stock Land Banks, which have not had the supervision or assistance of the Farm Loan Board in disposing of the bonds issued by them, make a much better showing—as the figures indicate that they have marketed through their own efforts nearly 80 per cent of the bonds which they have been authorized to issue.

Federal Land Banks Self-Sustaining

FORTUNATELY, the Federal Land Banks have attained the position where each one of them is self-sustaining, with the volume of business already secured. They have a gross income per month of about $1,600,000 and a net income of over $250,000 a month after paying all administrative expenses and providing for interest on all outstanding bonds. They have also accumulated a reserve fund, from and including undivided profits, aggregating $2,326,668. If they should, therefore, have to continue the policy adopted for them by the Farm Loan Board, in refusing new business, their administration expenses could be largely reduced and their undivided profits considerably increased.

It is this forced policy of inaction, *this tacit acknowledgment of defeat by the Farm Mortgage Bankers Association*—as the assumed result of an undecided lawsuit, which is criticised. It is the failure to suggest to Congress some method, and to ask for such relief as was needed, in order that the farm loan business might be continued, which is condemned.

The case before the Supreme Court was argued early in January, and Congress did not adjourn until June. It was apparent to all of the friends of the system, during this time, that even a favorable decision by the court would not enable the only method adopted heretofore for securing funds, namely, through a bankers' bond selling syndicate, to be continued or relied upon.

There is another matter which the friends of the Farm Loan Act view with much concern. Judge Charles E. Lobdell, of Kansas, who lately succeeded

(Concluded on page 15)

Protection, Not Punishment, Her Aim

A POLICEMAN had just brought into the court room a frightened, defiant boy of eleven years whom he had caught swinging on the back end of a street car. The law had been violated.

The judge of the juvenile court heard the officer's report. The policeman told how he had caught the "prisoner" red-handed, swinging on the car, in open violation of a city ordinance.

Judge Camille (Mrs. T. F.) Kelley leaned forward over the great desk and in even, earnest tones, thanked the officer, on behalf of the court and the "dear" child's mother for his vigilance and protection in bringing the child in before the boy, through thoughtless indiscretion, had been unfortunate enough to lose a leg or his life.

The officer was dumfounded. The boy's face brightened. The officer had seen only the law violation. The boy had thought only of the punishment.

The officer, transformed into a hero, left the court room in a glow of self-satisfaction. The boy remained to learn from this remarkable woman judge of the new order of things—a court whose aim is protection, not punishment.

Judge Kelley, recently named juvenile judge at Memphis, Tennessee, is the first woman ever appointed to a judicial place in the South. She believes that the "children's hour has broken upon the world—that hour 'between the dark and the daylight' that is known as the children's hour, the dark of the past with its false ideas of child life and the daylight of the future with its visions of child psychology."

Parents, uncles, aunts and neighbors will no longer say "go see what the children are doing and tell them to stop," if they adopt the doctrine of this woman.

MRS. T. F. KELLEY

The idea of using a long series of don'ts as reminders to restless juveniles, in search of mischievous occupation—of something to do—has given way to the suggestion of right rather than wrong, and the supervised recreation on the playground with its wholesome expression of youthful spontaneity and force has taken the place of the tack in the teacher's chair and the competitive fight at recess where small victims give gruesome entertainment to larger boys.

Judge Kelley is the mother of three children. She has never been a suffragist but now that women have the right of full suffrage she hopes "that every woman will see her new enfranchisement as an open door offering her the opportunity to make better education a part of every political platform and a privilege toward getting better child welfare legislation."

"What part, in your opinion, does the juvenile court of today play in this scheme of reconstruction? Is the juvenile court the discipline of fear and punishment or the discipline of loving protection and teaching?" Judge Kelley has been asked.

"My concept of a juvenile court is a strong arm used to supplement home care and training, or to supply a home if it does not exist, and a place where parents may go for counsel, concerning the life problem of their child. It is the arm of protection that holds the child thought in correct channels until it is strong enough to stand alone; the protection of right training that heals the bruised concept of sin."

If it becomes absolutely necessary to send a child to a "reform school" Judge Kelley insists that the child know such a step is not taken as a punishment but rather as protection so that the child may be trained to a service to himself and the world.

Boys particularly, it seems to Memphis' new juvenile judge, face a lot of hard knocks which might be avoided. Nor does she believe a little petting will make the boy a "mollycoddle."

Listen to this.

"Poor little old boys. I have always felt sorry for them. We tenderly shield our girls, but we push a "mere" boy off into the "shallot patch" to grow, saying the harder he takes life the sooner he will be able to become a man.

"A boy's heart starves for tenderness, and if mothers and fathers gave their boys more expressed love and tender consideration, they would not become "unconscious" the first time a real, sweet, fresh, young girl crossed their path."

Judge Kelley thinks we have featured morals too strenuously. Instead she believes more emphasis should be given to education and recreation.

Mrs. Kelley has been "Judge Kelley" only a few months. The first month—May of this year—she handled 133 cases. In June there were 143 cases. Of this number, 77 were not placed on the records because they were "first appearance" cases and Judge Kelley has decreed that no record is to be made of such cases.

She does not seek to send as many children to the reformatory as she can, but she strives to save them from themselves. She does not seek to have the state, county and city train the children, but rather seeks to have the parents train the children with the court's support. In the case of orphans, she is particularly careful and has found good homes for a majority of the orphan children who have been before her court.

Children may enter her court in a stubborn resistant mood but they never leave it in that frame of mind.

Judge Kelley, a descendant of one of the state's oldest families, is a sister of the late Howard Hawthorne McGee, one of Tennessee's most loved and gifted poets.

She is well versed in child psychology. Her own children are fifteen, thirteen and ten years old, the two older being boys. During her absence from home the children, who of course have the supervision of a governess, have been taught to submit all disputes and difficulties to her over the telephone. Her decision in cases thus referred to her is final.

Mrs. Kelley, during the years when she could spend all of her time with the children, taught them to accept without argument her rulings, and now that the disputes reach her via the telephone rather than face to face, the children accept with equally good grace any decision she may reach. She gives an attentive ear to both sides of such problems and hands down an impartial decision. One of her first official acts was the abolition of uniforms for children in the reformatory school and the adoption of an honor system. Tale bearing is not tolerated. No officer or employe of the court is permitted under any circumstances to strike a child.

Prohibitive rules have been done away with. Instead, Judge Kelley has had printed a list of affirmative rules, telling the children many good things they may do. Children at the reformatory school are allowed to play and they are permitted to talk at meals. Improvement is more rapid and more certain under the new system and many apparently incorrigible children have been restored to homes within the period of a few weeks.

Just now Judge Kelley has a plan for the purchase by the city of a large lot opposite the juvenile court for the use of juvenile delinquents as a playground. Supervised recreation, she insists, will do more than any form of punishment.

A Crisis in the Farm Loan System

Concluded from page 14

Mr. George W. Norris as Farm Loan Commissioner, and who is the commanding influence in the board, not only from his personality—which is most agreeable—but also as "chief executive officer," is opposed to the conduct of the business of the Federal Land Banks through the intervention of the National Farm Loan Association, as provided in the Farm Loan Act.

He would have loans made to the farmer borrowers through agents selected by the banks, when approved by the board, and require these borrowers to take stock direct in the Federal Land Banks, thus destroying the local associations entirely. Already a bill has been introduced by Congressman Strong, of Kansas, providing for the "voluntary" liquidation of associations, which is a stepping-stone toward carrying out these views. *It is said that Judge Lobdell was formerly the president of the state organization of the Mortgage Bankers Association for the state of Kansas.*

Ex-Senator Henry F. Hollis, the real author of the Farm Loan Act, but for whose untiring effort and persistent determination no rural credit legislation would have been agreed upon by the Sixty-fourth Congress, in a recent letter to the "National Board of Farm Organizations" at Washington, D. C., says:

"I wish to give my hearty indorsement to the plan of the organization of a union or alliance of Farm Loan Associations, and to urge in the strongest terms the retention of the present co-operative Farm Loan Associations under the Federal Farm Loan Act.

"The question of organizing local associations of farmers was carefully considered by the various committees and the decision, not only to permit the farmers to organize locally along co-operative lines, but to compel them to do so if they desired the benefits of government assistance, was reached with substantial unanimity in favor of the co-operative plan.

"The Farm Loan Act was the result of exhaustive and expensive personal study of the European co-operative banks and societies. It was intended that the Farm Loan Associations should set an example and serve as a nucleus for further extensive co-operation along the lines of purchasing, selling, insurance, stock raising and standardization of market products. The formation of several thousands of these local loan associations demonstrated the importance of the movement.

"I wish merely to testify that the whole subject was carefully investigated by the committees which worked out the Farm Loan Act, and that the decision was deliberately and intelligently reached.

"Experience under the act merely strengthens my personal belief that the Farm Loan Associations should be continued."

The Farm Loan System is facing a crisis, and is headed for severe reverses, unless its friends intelligently rush to its assistance.

A Strange Royal Gift

IN 1834 the emperor of Morocco, being in a repentant and conciliatory mood for having committed many misdeeds in his past, decided to atone for some of them by presenting to the United States certain tokens of his affection and good will. Accordingly, to the American consul at Tangier he gave two horses and a lion with the suggestion that they be forwarded to the President at the city of Washington.

With the "greatest pleasure" the worried consul accepted the horses and the lion. He was too much a diplomat to offend the emperor by refusing the gift; but he really did not feel equal to the occasion and assuredly did not relish the job of having them safely transported across the ocean. No cables connected him with his homeland, for the device for sending messages through water had not then been invented.

When the horses and the lion arrived at Washington, President Andrew Jackson and the members of his cabinet were a bit disconcerted. Then somebody had a happy thought that resulted in the matter being called to the attention of Congress. Strange to say, the eminent legislators displayed no disposition to hesitate; for early in February, 1835, they

"Resolved, By the Senate and House of Representatives in Congress assembled, That the President of the United States be, and he is hereby, authorized to cause the two horses received as a present by the consul of the United States at Tangier, from the emperor of Morocco, to be sold in Washington City, by public auction, on the last Saturday of February, 1835, and to cause the proceeds thereof to be placed in the Treasury of the United States; and that the lion received in like manner, be presented to such suitable institution, person or persons, as the President of the United States may designate." The resolution was approved February 13, 1835. Then the Secretary of State indited a letter to the emperor of Morocco expressing the great pleasure of the American Government and President Jackson at receiving such a truly magnificent gift.

The deluded old emperor of Morocco probably never knew that the horses were sold at public auction, or that the lion lived thereafter in an iron-barred room of a menagerie.

Shackling the Flood Devils of the Miami

Concluded from page 10

sum for the benefits which they are to receive. Thus far there has been almost no difficulty in the collection of these taxes. Indeed, it is shown by the records that the percentage of delinquents is exceedingly small, far smaller in fact than the average number of delinquents on state, county or municipal tax rolls.

The benefit to property is figured on the difference in its value before and after flood protection, and the cost of the works is estimated at about 50 per cent of these benefits. Thus, on an added valuation of $1,000 the assessment will be $500 if paid in cash. Five per cent interest is added when the assessment is paid in annual installments over a period of 30 years.

In only one way does it appear that the project falls short and that is in the failure to make provisions for the development of electric energy. Stones which are set in the face of the concrete work of the dams emphasize this by proclaiming the fact that the structures are never to be used for the generation of power.

It seems that during the days when the Conservancy Act was still before the legislature and its fate very doubtful, the favorite argument of the opposition was that public money would build the dams but private interests would use them for power purposes. This threat was probably a back fire inspired by interests which would have been seriously disturbed by the erection of publicly-owned hydroelectric plants, but which did not dare come out openly and oppose the plans for flood protection.

The leaders of the Conservancy movement, fearing for the success of their campaign and probably failing to see the duplicity of the attack, met the charge by pledging the public that, if the laws passed, the dams would never be used for anything except the protection of the valley.

That pledge is unworthy of the spirit which fostered such a mighty undertaking as the Miami Conservancy project. One wonders how a people, who show the vision that the people of the Miami have exhibited in planning for their future safety, could have surrendered such an enormously valuable right as that which lies in the development of their water power. And it is impossible to believe that the time will not soon come when they will awaken to their loss and take steps to bring about an amendment of the act.

When that time comes the public will be able to judge by the identity of those who oppose the amendment just what interests were at work seven years ago.

As the work nears completion every precaution is being used to protect it against sudden floods. The conduits in the base of the dams have been left much larger than they will be when finally finished and other outlets have been prepared for high waters. The Englewood dam at its unfinished end is to be protected by a heavy rolled fill during the fall, winter and spring months. With the memory of the 1913 flood still fresh, the district is taking no chances of a repetition of that disaster and the thoroughness with which this last detail of the work is being watched is symptomatic of the spirit of the entire project.

"It must never happen again," said the people of the valley when the waters of the great flood had receded and the towering dams which will fasten the shackles so skillfully upon the flood waters of the future are the result of that determination: a tribute to the vision of a people who were willing to forget the immediate tomorrow and build for the ages.

Briefly Told

A 7,500-ton concrete tanker recently sailed from San Diego, California.

Perfumes with the fragrance of jasmine, musk and hyacinth used for scenting expensive soaps originate in a coal mine. Pitch, creosote, oils, carbolic acid, antiseptics and high explosives are all hidden in a lump of coal.

The Modern Health Crusade, a competitive system of hygiene, numbers among its members about 4,000,000 children in the United States.

After a careful investigation the government has decided that 6,000 lobsters which were transplanted from the Atlantic Coast to Pacific waters were evicted by riotous crabs, and are now conducting the world's longest retreat via the Panama Canal.

The United States has paid the Chicago, Milwaukee & St. Paul Railroad $30,000,000 for the "rent" of its properties during the time the railroads were under the control of the government during the war.

Two million twenty-three thousand out of 2,728,000 persons driven away from their homes in France by war had returned up to April 1, 1920.

A French automobile builder has designed an airplane that can be used either as a monoplane or biplane.

Cup-shaped oil reservoirs in the end of each leaf afford continuous lubrication to a new automobile spring.

Two army trucks surrounded by a large guard of troops passed through the streets of Portland, Oregon, and the general belief was that gold was being shipped to Japan. It turned out that the trucks contained 2,000 quarts of whisky for military hospitals in California.

In the Tower of London is kept the golden ampulla, or anointing cup, made for the coronation of Charles II.

Sixty-one per cent of the present stand of saw timber lies west of the Great Plains.

The famous race horse, Man o' War, receives more personal attention than any being, human or otherwise, since Cleopatra. He has a retinue of servants and is housed more expensively than the Gaekwar of Baroda or the Jhilwar of Jhock.

Sam P. Coles, "King of the Newsboys," of London, has been married to Miss Adele Victoria Robertson, who won many medals for service in the Canadian Red Cross during the war.

Under English common law no one has a right to bathe in the sea. The law has been tested and upheld, but not generally observed.

A substitute for absorbent cotton is being obtained from pine cellulose.

A first-class private in the American Army is now permitted to wear one chevron.

Sawdust, treated with certain acids, has been found to be a good feed for cattle when judiciously mixed with other fodder.

Forest examiners cruising timber in the Deschutes National Forest of Oregon discovered a tunnel-shaped cave more than a mile in length.

Hugh Jennings, who resigned as manager of the Detroit baseball team after 14 years' service, will take up the practice of law, a profession which has engaged his attention during the baseball off-season since his graduation from Cornell University.

Workers in the government-owned and operated coal mines in Alaska have threatened to strike unless granted a raise of $1.50 a day.

A church was built at Santa Rosa, California, and every part of it, except the flooring, came from one tree, a giant redwood which yielded 78,000 feet of timber and many shingles.

Ice forming on the Yukon River October 8 has resulted in steamers being shut in for the winter.

The interior of the Okefinokee Swamp of Georgia has never been visited.

Artesian well diggers in Montana recently discovered coal of merchantable grade and in great quantity.

Brazil is preparing to provide a federal body which will conserve and develop her national resources.

In Utah, machinery is being taken to a mine and certain rare ores brought to the railroad by airplanes in a few hours. Formerly six weeks were required to make the journey by wagon.

The blossom of the wattle, a tree of the gum family, has assumed a distinct national significance and has been recognized as Australia's floral emblem.

An American Indian in California is the owner of a bee ranch of 900 stands that produced 33 tons of honey this season.

The provisional government of Mexico has issued an order stating that a license for selling liquor will not be issued to an American.

Airplane travel has become so common in France that innkeepers in villages have complained to the government against the numerous fliers who rise early and fly away forgetting to pay their bills.

Adam Duncan, who is credited with the development of the tomato from a decorative vine to a favorite of the table, is dead at Hillingdon, England, aged 80 years.

Eckhardt von Schack, former German vice-consul-general at San Francisco, who has been granted a parole from Leavenworth Prison, hesitates to leave because a deportation warrant awaits him.

General Leman, Belgian hero, whose fight at Liege held up the German advance long enough to give the Allies a chance to prepare for the Battle of the Marne, is dead. He was the only Allied officer whose heroism inspired the Germans to return his surrendered sword.

Helping the Indian to Reconquer America

Oil and Ideals—They Mix Them in Oklahoma

The rich western state has not forgotten, even in the midst of the mad rush for the wealth which spouts from its soil, that it owes a duty to the present and to future generations of boys and girls.

Jews Use the Peace Conference to Shackle Poland

Do you know that the Jewish Sabbath was established in Poland by the Peace Conference, in which the President of the United States concurred? Polish Jews are coming in hordes to this country—will they ask for the same discriminatory laws here?

The Patron Saint of the Dairy Industry

The story of Dr. Stephen Moulton Babcock, who developed the milk testing machine which made possible the expansion of the dairy business of the world and who threw away a fortune in these words, "The test is not patented."

A Thumb-nail History of the Great War

Many Men of Many Minds

William Jennings Bryan.—War arouses all the brute in man and a flood of passion drowns all kindly feeling. War creates a profession that perfects itself into a science. War creates standards of honor as false as those which supported dueling. War teaches that revenge is a virtue and retaliation a patriotic duty.

Charles Clifton, president, National Automobile Chamber of Commerce.—The passenger automobile has already geared a world to a new efficiency of commerce, a new standard of life, a new philosophy of thought. It is aiding in solving the acute housing problem; it has increased by one-sixth the man power of the country by transporting workers more rapidly; it has aided the banking business, increased labor efficiency, increased health and checked crime. Already the giant power wielded by the use of the automobile is reflected in a stimulated national life.

S. Yoshino, Japanese professor.—The voice of liberalism in Japan is still weak, and is liable to be drowned in the general cry for expansion on aggressive lines.

Edward Hungerford.—Can you conceive of a man who would erect a huge office building in a remote locality without giving a thought to securing tenants? The state of New York is in a like position. It has constructed a great barge canal and does not quite know what to do with it.

I. D. Graham.—The remedy for the farmers' troubles is organization. They are organizing for self-protection as never before. And they are going to succeed, but not as I. W. W., or through any revolutionary fraternities of that ilk. They have tried organized effort in a desultory sort of way in past years, but they did not go far enough. The farmers are beginning to realize that collectively their most efficient ally is co-operative buying.

Farmers Organize and Plan Use of Buying Power

Sir William Wiseman, British banker.—As to the economic situation in Europe, there is no getting away from the fact that it is far from normal, far from good. But I believe it will slowly improve, and we are past the worst of it. But the improvement will be accompanied by a number of political troubles which will bring economic setbacks. The British coal strike is one of these. The strike and other troubles will have the effect of setting back our economic recovery in proportion to the time the troubles last.

Franklin K. Lane, former Secretary of the Interior.—I am not expecting that the cost of labor will fall off, even in the worst of times, to its pre-war stage, for I believe that the real differential between directing labor and manual labor will never again be as great as it has been.

Roberto V. Pesqueira, confidential agent of the Mexican Government.—It is my business to build up these necessary co-operation contacts, promoting an association in expansion and development that will mean much to both countries. Mexico has well been called the treasure house of the world. We mean to guard our tremendous resources against the exploitations of the past, but there is no touch of narrowness in our program. Those who work with us will share with us.

Dr. Edward Benes, Minister of Foreign Affairs, Czecho-Slovakia.—A settled peace will be impossible in Europe as long as the relations between Poland and Russia are not friendly.

Albert W. Atwood.—An increasing number of historians and other students regard Bolshevism as a vast Asiatic fanaticism, a migration westward of Asiatic hordes bent upon conquest, exactly like the followers of Mohammed, who swept into Europe in early times and threatened to engulf Western culture and civilization; the movement is likened to the epidemics from the East which have nearly conquered Europe at various times. The students hold that Bolshevism has merely adopted a few of the catch phrases of Marx to fool the workers in other countries; that the movement is not essentially economic at all, but solely a new form of frenzied fanaticism, such as Islam was in its day.

Suggests Bolshevism Is Epidemic of Asiatic Fanaticism

V. Blasco Ibanez.—When an American laughs he laughs all over. He throws his mouth open as wide as possible and makes as much noise as he can. An American may be out of sight in the next room; when you hear him laugh you can be sure he is an American.

Louis Graves.—There is no prohibition issue in North Carolina. The affair is settled. If a vote were taken on the question today the dry majority would be far greater than it was when the wets and drys lined up against each other for their state-wide fight in 1908.

Dr. J. Lewin, Russian editor.—The Bolshevist leaders have abolished the right to strike because they declare workmen who are working for themselves must not strike against themselves. Now workers cannot leave their places of employment if they are discontented with conditions, but must obey the man in charge of the factory. In other words, a revolutionary government, calling itself a soviet government and claiming to represent a dictatorship of the proletariat, has been forced within two years to subject this ruling labor class to a system of government which prevailed in Russia one hundred years ago.

Russian Workers Can't Quit in Soviet Factories

Sir Gilbert Murray, Oxford professor and Liberal leader.—The outbreak of international blackguardism which dominated the general election of 1918 queered the pitch for any wise or generous reconstruction of Europe. It determined the downward road of European civilization and, in spite of occasional convulsive struggles from the British prime minister, handed over the main direction of policy in France and England to the worst elements of public life. After 1918, the Peace Conference stumbled on from incompetence to worse than incompetence. Britain made no allowance for the effect these things were having on American opinion. Instead, we felt as if, obviously, so that every American could see, the people governing us were not England, while the real England which hated militarism and never thought about oil wells and imperial tariffs was more desperately in need of help than ever before in history. And meantime America hardly knew of the existence of our real England and as our need became more desperate, America became more disgusted and more aloof. Yet I go on hoping and believing in America. I believe she will, in some form or other, join the League of Nations.

Charles H. Cunningham, former trade commissioner to Mexico.—American bankers and business men forfeit their great opportunity in Mexico by becoming frightened at every sign of a revolution. Concerns controlled by other countries sit tight and saw wood during a revolution and come out of it more solidly entrenched than before.

Thomas A. Edison.—I have been at work for some time building an apparatus to see if it is possible for personalities which have left this earth to communicate with us. If our personality survives, then it is strictly logical and scientific to assume that it retains memory, intellect and other faculties and knowledge that we acquire on this earth. Therefore, if personality exists after what we call death, it is reasonable to conclude that those who leave this earth communicate with those they have left here. Accordingly the thing to do is to furnish the best conceivable means to make it easy for them to open communication with them.

Edison Seeking to Communicate With the Departed

Frederick Houk Law, educator.—It is hard for the advocates of prohibition to picture the Pilgrim Fathers drinking beer—but drink beer they did. Shortly after the landing of the Mayflower, on the first celebration of Christmas, the ship's captain showed his good will toward his passengers by sending ashore a large supply of beer—which was received with joy and thanks. In 1646 the Pilgrims paid the cost of magistrates by levying a tax on wine, strong liquor and tobacco—and the people of Plymouth bought enough of the articles named to provide the needed funds.

Edward A. Filene, Boston merchant and publicist.—France is torn by conflicting emotions—a desire to secure the indemnity which she needs and a fear lest, in permitting Germany to gain the economic power necessary to pay the indemnity, she would create a rival who would later crush her. In Germany I found what seemed to be a general agreement that until the amount of the indemnity is fixed, no real progress toward German industrial reconstruction can be made.

Edwin T. Meredith, Secretary of Agriculture.—Speculation and reckless inflation of land values have been much in evidence during the last year or two, and until this movement is checked, it will result in conditions which are highly detrimental not only to the farming interests of the country, but to our entire economic structure.

Joshua W. Alexander, Secretary of Commerce.—Unquestionably the country is on an economically sound basis. We have the raw materials and we have the capital. As a matter of fact, we have a surplus of raw materials in some lines, as indicated by the fact that the producers of wool are finding it difficult to market their product. We have large agricultural crops, which, of course, have always constituted the backbone of our prosperity.

Richard S. Hawes, president of American Bankers Association.—With a prospective decrease in prices and increase in the disposition of industrial and labor leaders to recognize their mutual obligations and duties, both to each other and the public, we may reasonably look forward without alarm to better adjustment of the forces of labor and capital. Production in the country is now somewhat above the pre-war level and showing indications of improvement.

William Mather Lewis, director, savings, United States Treasury.—Economic knowledge has been confined to a few university professors, financiers and advanced college students. The science of finance is a closed book for most of us. When we are sick we consult a doctor, when we need legal advice we see a lawyer, but when the investment bug bites us, instead of consulting a reliable banker or broker, we sneak up an alley and pass our hard earned cash to someone who has hypnotized us with his fair story of sudden wealth.

M. P. Boynton, D. D., Chicago pastor.—Gambling is an ancient vice. It is one of the sins that has most tempted and oppressed human flesh. The gambler is a disgusting personality. He is the wreck of a man. He is the sum of the loss of all values. He lives in an abnormal world. He is to all intents and purposes insane. He is intoxicated by gold. His yellow streak is all that is left of him. He is the essence of social poison; whatever he touches dies. He is blind to beauty, deaf to harmony, and dead to the really vital things of life. The value in wife, children, home, business, friends are as nothing to the gambler in his passion for gain.

Describes Gambler as a "Sum of the Loss of All Values"

Cardinal Gibbons.—I am in favor of very different world arrangements and of "checks and balances," to use the words of our political fathers, from those that made possible what happened in 1914. Do you recall how it came? There were a few letters from foreign ministers, half published, or not at all. A few telegrams exchanged between emperors and kings and then rivers of blood began to flow to the Niagara of suffering at which we, dumfounded and almost helpless, still assist.

Fred C. Kelly.—A man who says a thing can't be done should bear in mind that his testimony is entirely negative. In court negative testimony never gets as much weight as positive. If one witness says he heard a clock strike at a certain time, and another man declares that he didn't hear such a sound, the one who says he *did* hear is more likely to be telling the truth. When a man tells me a thing isn't so, I ask him: "Then what are the facts?"

Sat Hing Kan, successful Chinese merchant.—There are hundreds of young men in China and America having splendid native and foreign college educations, well balanced in Chinese etiquette and custom and acquainted with American customs, who could serve American firms in getting Chinese trade. Yet they are seldom invited to do so, nor do Americans pay the slightest attention to them while they are in this country at school.

Franklin H. Giddings.—A "public" is always in one way stronger and in one way weaker than the body of producers to which it is related. It is stronger because it is bigger, and when it is aroused and organized it is irresistible. It is weaker in so far as it is less homogeneous, less compact, usually less well organized and less continuously "on the job." The public, therefore, is irregular, uncertain and often erratic in its behavior. Corporations and governments can exploit the public, bully it, and tyrannize over it a long time and impudently before the clumsy collective creature rouses and rebels, but when that creature does rouse and rebel the offender may as well throw up his hands.

Public Temper Is as Uncertain a Thing as TNT

Forrest Crissey.—In these days of hair-trigger labor discussions it is pleasant to announce that there is at least one thing on which virtually all men in industry, from lowest to highest, are of one mind. This is the strategic importance of the foreman.

A Thumb-nail History of the World War

By H. O. BISHOP

ARMISTICE day will naturally bring back to the minds of all Americans the innumerable vital details of preparation and execution that made it possible for the American Expeditionary Forces to achieve such notable victories.

The high spots of the great conflict are herewith presented to the readers of THE DEARBORN INDEPENDENT in boiled-down paragraphs of gripping interest.

The war cost the people of the United States considerably more than $1,000,000 an hour for more than two years.

The direct cost was about $22,000,000,000, or nearly enough to pay the entire cost of running the United States Government from 1791 up to the outbreak of the European war.

Our expenditures in this war were sufficient to have carried on the Revolutionary War continuously for more than 1,000 years at the rate of expenditure which that war actually involved.

In addition to this huge expenditure nearly $10,000,000,000 were loaned by the United States to the Allies.

The army expenditures were over $14,000,000,000, or nearly two-thirds of the total war costs.

During the first three months our war expenditures were at the rate of $2,000,000 a day. During the next year they averaged more than $22,000,000 a day. For the final ten months of the period, from April, 1917, to April, 1919, the daily average was over $44,000,000.

Despite the fact that the army expenditures are less than two-thirds of our total war costs, they are nearly equal to the value of all the gold produced in the world, from the discovery of America up to the outbreak of the World War.

The pay of the army during the war cost more than the combined salaries of all the public school principals and teachers in the United States for the five years from 1912 to 1916.

The total war costs of all nations were about $186,000,000,000, of which the Allies and the United States spent two-thirds and the enemy one-third.

The three nations spending the greatest amounts were Germany, Great Britain and France, in that order. After them came the United States and Austria-Hungary, with substantially equal expenditures.

The United States spent about one-eighth of the entire cost of the war, and something less than one-fifth of the expenditures of the Allied side.

Of every 100 American soldiers and sailors who served in the war with Germany, two were killed or died of disease during the period of hostilities.

The total battle deaths of all nations were greater than all the deaths in all the wars in the previous 100 years.

Russian battle deaths were 34 times as heavy as those of the United States, those of Germany 32 times as great, the French 28 times, and the British 18 times as large.

The number of American lives lost was 122,500, of which about 10,000 were in the navy, and the rest in the army and the marines attached to it.

In the American Army the casualty rate in the infantry was higher than in any other service, and that for officers was higher than for men.

For every man killed in battle seven were wounded.

Five out of every six men sent to hospitals on account of wounds were cured and returned to duty.

In the expeditionary forces battle losses were twice as large as deaths from disease.

In this war the death rate from disease was lower, and the death rate from battle was higher than in any other previous American war.

Inoculation, clean camps, and safe drinking water, practically eliminated typhoid fever among the troops.

Pneumonia killed more soldiers than were killed in battle. Meningitis was the next most serious disease.

Of each 100 cases of social diseases recorded in the United States, 96 were contracted before entering the army and only four afterward.

During the entire war, available hospital facilities in the A. E. F. were in excess of the needs.

Two out of every three American soldiers who reached France took part in battle. The number who reached France was 2,084,000, and of these 1,390,000 saw active service at the front.

Of the 42 divisions that reached France 29 took part in active combat service. Seven of them were regular army divisions, 11 were organized from the National Guard, and 11 were made up of National Army troops.

American divisions were in battle for 200 days and engaged in 13 major operations.

From the middle of August until the end of the war the American divisions held during the greater part of the time a front longer than that held by the British.

In October the American divisions held 101 miles of line, or 23 per cent of the entire western front.

On the first of April the Germans had a superiority of 324,000 in rifle strength. Due to American arrivals the Allied strength exceeded that of the Germans in June and was more than 600,000 above it in November.

In the battle of St. Mihiel 550,000 Americans were engaged, as compared with about 100,000 on the North-

ern side in the battle of Gettysburg. The artillery fired more than 1,000,000 shells in four hours, which is the most intense concentration of artillery fire recorded in history.

The Meuse-Argonne battle lasted for 47 days, during which 1,200,000 American troops were engaged.

The American battle losses of the war were 50,000 killed and 236,000 wounded. They are heavy when counted in terms of lives and suffering, but light compared with the enormous price paid by the nations at whose sides we fought.

When war was declared the United States had 55 training airplanes, of which 51 were classified as obsolete and the other 4 as obsolescent.

When we entered the war the Allies made the designs of their planes available to us and before the end of the hostilities furnished us from their own manufacture 3,800 service planes.

Aviation training schools in the United States graduated 8,602 men from elementary courses and 4,028 from advanced courses. More than 5,000 pilots and observers were sent overseas.

The total personnel of the air service, officers, students and enlisted men, increased from 1,200 at the outbreak of the war to nearly 200,000 at its close.

There were produced in the United States to November 30, 1918, more than 8,000 training planes and more than 16,000 training engines.

The De Haviland-4, observation and day bombing plane, was the only plane the United States put into quantity production. Before the signing of the armistice 3,227 had been completed and 1,885 shipped overseas. The plane was successfully used at the front for three months.

The production of the 12-cylinder Liberty engine was America's chief contribution to aviation. Before the armistice 13,574 had been completed, 4,435 shipped to the expeditionary forces, and 1,025 delivered to the Allies.

The first flyers in action wearing the American uniform were members of the Lafayette Escadrille, who were transferred to the American service in December, 1917.

The American air force at the front grew from three squadrons in April to 45 in November, 1918. On November 11 the 45 squadrons had an equipment of 740 planes.

Of 2,698 planes sent to the zone of the advance for American aviators 667, or nearly one-fourth, were of American manufacture.

American air squadrons played important rôles in the battles of Chateau-Thierry, St. Mihiel, and the Meuse-Argonne. They brought down in combat 755 enemy planes, while their own losses of planes numbered only 357.

When war was declared the United States had sufficient light artillery to equip an army of 500,000 men, and shortly found itself confronted with the problem of preparing to equip 5,000,000 men.

To meet the situation it was decided in June, 1917, to allot our guns to training purposes and to equip our forces in France with artillery conforming to the French and British standard calibers.

It was arranged that we should purchase from the French and British the artillery needed for our first divisions and ship them in return equivalent amounts of steel, copper and other raw materials, so that they could either manufacture guns for us in their own factories or give us guns out of their stocks and replace them by new ones made from our materials.

Up to the end of April, 1919, the number of complete artillery units produced in American plants was more than 3,000, or equal to all those purchased from the French and British during the war.

The number of rounds of complete artillery ammunition produced in American plants was in excess of 20,000,000 as compared with 9,000,000 rounds secured from the French and British.

In the first 20 months after the declaration of war by each country the British did better than we did in the production of light artillery, and we excelled them in producing heavy artillery and both light and heavy ammunition.

So far as the Allies were concerned, the European war was in large measure fought with American powder and high explosives.

At the end of the war American production of smokeless powder was 45 per cent greater than the French and British production combined.

At the end of the war the American production of high explosives was 40 per cent greater than Great Britain's and nearly double that of France.

During the war America produced 10,000 tons of gas, much of which was sold to the French and British.

In round numbers, we had in France 3,500 pieces of artillery, of which nearly 500 were made in America, and we used on the firing line 2,250 pieces, of which over 100 were made in America.

The problems of feeding and clothing the army were difficult because of the immense quantities involved rather than because of the difficulty of manufacturing the articles needed.

Requirements for some kinds of clothing for the army were more than twice as great as the pre-war total American production of the same articles.

To secure the articles needed for the army the government had to commandeer all the wool and some other staple articles in the United States and control production through all its stages.

The distribution of supplies in the expeditionary forces required the creation of an organization called the services of supply, to which one-fourth of all the troops who went overseas were assigned.

American engineers built in France 83 new ship berths, 1,000 miles of standard-gauge track, and 538 miles of narrow-gauge track.

The signal corps strung in France 100,000 miles of telephone and telegraph wire.

Prior to the armistice 40,000 trucks were shipped to the forces in France.

Construction projects in the United States cost twice as much as the Panama Canal, and the construction overseas was on nearly as large a scale.

During our 19 months of war more than 2,000,000 American soldiers were carried to France. Half a million of these went over in the first 13 months and a million and a half in the last six months.

The highest troop carrying records are those of July, 1918, when 306,000 soldiers were carried to Europe, and May, 1919, when 330,000 were brought home to America.

Most of the troops who sailed for France left from New York. Half of them landed in England and the other half landed in France.

Among every 100 Americans who went over 49 went in British ships, 45 in American ships, three in Italian, two in French, and one in Russian shipping under English control.

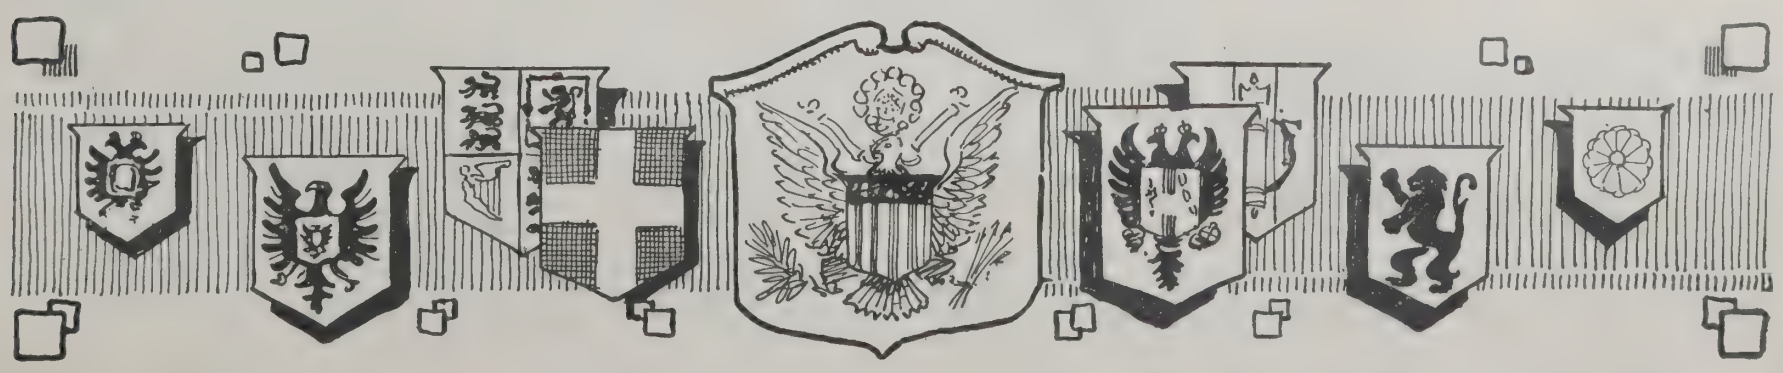
Our cargo ships averaged one complete trip every 70 days and our troop ships one complete trip every 35 days.

The cargo fleet was almost exclusively American. It reached the size of 2,600,000 deadweight tons and carried to Europe about 7,500,000 tons of cargo.

The greatest troop carrier among all the ships was the Leviathan, which landed 12,000 men, or the equivalent of a German division, in France every month.

The fastest transports were the Great Northern and the Northern Pacific, which made complete turnarounds, took on new troops, and started back again in 19 days.

The average American soldier who fought in France had six months of training in this country, two months overseas before entering the line and one month in a quiet sector before going into battle.



Most soldiers received their training in infantry divisions which are our typical combat units and consist of about 1,000 officers and 27,000 men.

Forty-two divisions were sent to France.

More than two-thirds of our line officers were graduates of the officers' training camps.

France and England sent to this country nearly 800 specially skilled and noncommissioned officers who rendered important service as instructors in our training camps.

When war was declared the army had on hand less than 600,000 Springfield rifles. Their manufacture was continued, and the American Enfield rifle designed and put into production.

Rebuilding the Rural School

THERE was a time when the little red schoolhouse was the hub of the American educational system. But as the cities grew and more and more students made demands upon the universities, the rural school lost its pre-eminence. Men and women who entered educational work and received the training of universities and normal colleges almost invariably sought the larger fields of endeavor so that the standard of teaching in the country school fell further and further behind that in the cities.

Today educators are awakening to the fact that they have been like builders who construct a 16-story building on a foundation built to support two stories. They realize that the rural school is weak and that until it is strengthened the entire structure of American educational work will be faulty. It is as a result of this awakening that the men and women who guide the schools of the country are agitating in their state conventions for the immediate rehabilitation of the rural school, the introduction of modern methods of pedagogy and of the newest courses of study.

Rural education should be as much a part of the national program of educational work as university education and, while the two cannot be compared in any sense, it is certain that the rural school, since it supplies the fundamentals without which the other cannot exist, is the more important of the two. Lack of recognition of this has been responsible for the fact that educators generally came to look with condescension, if not contempt, upon positions in rural schools. And because the educators themselves placed a low value on the services of the country school-teacher it was but natural that the salaries paid those holding such positions were little better than the wages of unskilled labor.

It may take some time to rehabilitate the rural school but the task must be accomplished if we are to hope for the repopulation of our farms by progressive men and women. Few fathers and mothers will be willing to rear a family in a community which offers only the most meager educational advantages to its children, and intelligent parents will not willingly go back to the land, as they are being urged to do, until they are assured they will not deprive their children of the opportunity for an education by so doing.

Fortunately, each state is the sole guardian of its educational system and once the state boards of education can be brought to sense the necessity of giving special attention to the country schools the work of reconstruction will be quickly accomplished.

It is the task of the trained educators to awaken the public and the public's official servants, and their new interest in the rural problem is a hopeful sign that they are preparing to discharge this responsibility.

Prohibition's Friendly Enemies

DISCOVERY by the Federal authorities that bootleggers have been disposing of poisonous brews by camouflaging the bottles with counterfeit internal revenue stamps and labels is another instance of the way in which the rum runner destroys his illicit business and strengthens the efficacy of the very law which he seeks to destroy.

Up to the time of the announcement by Federal agents that large quantities of counterfeit stamps had been found in the possession of members of whisky rings in several parts of the country, the purchaser of contraband goods believed the seal of the revenue stamp afforded him complete protection. It was practically his last refuge, for his faith in unlabeled goods had been destroyed by the knowledge that the contents of unsealed containers were apt to be anything from wood alcohol to embalming fluid.

The announcement by the government that revenue stamps and even the labels of famous brands of liquors have been counterfeited in large quantities will do more to hasten the enforcement of the prohibition laws than a thousand special officers. Just as the first wood alcohol deaths dealt a blow at the illegal traffic which all but wiped out the sale of unsealed liquors, so the news that these deadly poisons are now masquerading under fraudulent stamps and labels in the guise of government-bonded goods will destroy in time the bulk of the illicit trade which remains.

There is no need to worry greatly over the enforcement of the Eighteenth Amendment. Its enemies are automatically destroying themselves by their own conscienceless greed.

Federal Divorce Legislation

WITH suffrage a fact we may expect to witness a recrudescence of activity in the movement to amend the Constitution, wipe out the varied state laws on divorce, and substitute Federal legislation therefor.

Divorce itself is scarcely a greater evil than the unsatisfactory state laws that now permit persons to go their respective ways. Scandals of the divorce court are not uncommon to the readers of daily newspapers, but there can be no remedy for such conditions with the present system obtaining.

One jurist recently said:

"I do not see why uniform laws on divorce are not as necessary as uniform bankruptcy laws. It would be possible for the local courts to administer and handle divorce cases just as naturalization work, provided for by Federal laws, is carried on in local courts. When a divorce case is filed, Federal officers could look up the case to be sure there is no collusion, and then the case could be tried in the regular way in the circuit court. It would be possible to get after men who move from one state to another to avoid paying alimony to their helpless wives and children."

As suggested, it would introduce a more serious note in marriage if it were known that the stern hand of Uncle Sam were raised to see that justice was meted out impartially to all.

Friends

A SHORT time ago a London newspaper offered a prize for the best definition of "A Friend." Among the many thousand answers which were received, the one that was awarded the first prize was:

> "The first person who comes in when the world goes out."

The second prize was given to the definition sent in by a small boy, who wrote:

> "A friend is a feller who knows all about you and likes you just the same."

Both of these definitions are worthy of thought.

How many times has every one needed a friend "when the world goes out" through the death of a loved one, the wreck of business or the failure to achieve one's most cherished desires! In those moments, many whom we have considered to be our friends have forsaken us. With the loss of money our so-called friends have melted away. With the decline of power and position those who have flattered us and made us believe that their friendship would be everlasting, are found among the missing. It is on those occasions that the first person who is ready to lend a helping hand, to breathe a word of consolation in our sorrow, be he the acquaintance of a day or of a lifetime, is a true friend.

In these days of rush and hurry, of moving from place to place as business or other requirements may dictate, we make many acquaintances, but few real friends, and as a man or woman advances toward middle life the chances of making new and tried friends diminish. It is those we have known since childhood, our schoolmates, our college chums, our first associates in business who are our staunchest friends. Never in the glamour of the new, who come to us with fair words and specious promises but who fade away like morning mists before the sun when storms of adversity arise, should we let go of an old and tried friend.

Shakespeare knew the value of an old friend when he wrote:

> "Those friends thou hast, and their adoption tried,
> Grapple them to thy soul with hoops of steel."

Yes, the old friends are the best—the "feller who knows all about you and likes you just the same."

Colloids in Character

IN A recent article in the *Scientific American*, Karl Knipe describes a colloid as that state of matter which lies between the world of size and form, of solid matter and the hazy realm of invisible electrons, atoms and molecules.

Rather highbrow—but interesting, when we consider that what is meant is that a colloid is so infinitely small that it cannot be seen even through an ordinary microscope, and a special attachment has to be used.

It is these colloidal particles in the human body which keep it from leaking when water, coffee, tea or other liquids are poured into it. We are not rubber-lined, and were it not for the colloids—well, something would happen.

In the industries colloids are most important, and are found to be a component of such products as glue, cement, rubber, inks, dyes, and so on. Nature also claims them. The asphalt from the pitch lake in Trinidad is full of them, and it is these colloids which give it such stability when used as a pavement.

The study of colloidal chemistry is most fascinating because it emphasizes the fact that it is the small things that are, very often, the most valuable. This is true in the moral as well as in the scientific world.

Charm is that intangible something that cannot be defined, and yet without which a person has lost much of his attractiveness. In character it is a colloid which binds the more rugged traits together and makes a pleasing whole. A man may be honest, virtuous, square in his dealings with all men, and a tireless worker, yet if charm is lacking he somehow fails to attract and draw people to him.

Tact is another colloid in character. How many persons there are who are as good as gold, dependable and true to the core, and yet are so outspoken and blunt in giving their opinions, and in their criticism of others, that they are disliked and avoided. It is so easy to say a thing in a pleasant way that will not offend, that it seems strange anyone should do otherwise. There is no reason to stir up a hornet's nest simply because you happen to have a stick in your hand. Let the colloid of Tact become a part of your make-up and see how much better people will like you.

Simplicity is another of these atoms which go to make up a disposition to be desired. The ostentatious man or woman, who with vulgar show and flashiness of dress endeavors to make a favorable impression, always fails except among those of his own kind. But every one is impressed with simplicity. The soft voice, the gentle touch, the quiet performance of duty, are the colloids in character which hold a person's love and friendship for the one who possesses them.

Memory experts tell us that the linking of a certain object with what we want to remember is a sure way of bringing it to our mind, when that object is again seen.

The next time you walk upon asphalt pavement, let it suggest to you, because of the colloids which it contains, the three colloids of character which have been enumerated, Charm, Tact and Simplicity, which every one should desire to possess.

Politeness and Profiteering

THE public would be more interested in the announced determination of coal mine operators to assist the Department of Justice in eliminating high prices if the operators said anything about making a material reduction in the cost of fuel. While expressing themselves as extremely willing to assist the Attorney-General in any way and while deploring unreasonably high prices, the operators declare they do not believe much profiteering exists and that if it does exist they themselves are not participating.

Boiled down, what the operators really subscribe to is a belief that prices should come down, but not *their* prices, and this, of course, is an attitude which at once wrecks all hopes for a material reduction in the cost of coal.

Everyone who has anything to do with mining, handling, transporting or selling coal has now participated in the game of "passing the buck." Mine owners, sales companies, railroads and retailers are all making just a bare living—if you will accept their verbal and forget their excess profit statements.

And, by the way, what possible good did the Department of Justice expect would result from their invitation to the coal mine operators to reduce profits? Is it possible that the department entertained the delusion that interests which have successfully and continuously exploited the public for the last two years would reform and lead better lives just at a time when winter is coming on?

Is it possible that there is that much credulity in the world?

Mr. Ford's Page

"WHAT a comfort it is to find a statesman who did not succeed by his tongue," says Gamaliel Bradford in his *Atlantic Monthly* study of Grover Cleveland. And perhaps there has been no period in our history when such a statement could have been received with more chuckling satisfaction than just now. We have had a long period of great talk. Some of it is destined to be remembered and quoted for centuries. But great talk needs great fulfillment, and great fulfillment usually takes place in silence. It is altogether probable that we have entered upon a period when the capacity to do things will supersede the capacity to descry great things in prophetic vision.

The world was a quarter of a century "saving up," so to speak, for a great test of military strength. It "blew in" its 25-year accumulations in four years. It is somewhat surprised that it has not recovered from its headache in two years. The recovery so far, however, might have been very much worse than it was.

The financial effects of the war are still with us. A great deal of money was manufactured in order to carry on the vast expenditures necessary for war, until there seemed to be plenty of money for everything and everybody. Financiers knew that this "expansion" was only a business device, but the people were allowed to think it was prosperity. It is somewhat strange that the people, who ultimately give to money whatever value it has, should have been in the dark about it. A great deal of advice was given against "extravagance," but the incitement to extravagance was not mentioned. The people were not told as they should have been: "Now, this apparent plentifulness of money is in appearance only. Some of these dollars represent wealth that hasn't been created yet. So be careful what you do with them, for you are not only spending your present, but you may be also mortgaging your future."

That condition still affects our lives. The readjustment period has arrived. It is fraught with certain inconveniences, but not necessarily with hardship or danger. When things go unequally something has to stop while something else catches up. The greatest inconveniences of this period arise from our present inability to transfer men from the departments that have to stop, to the departments that have to catch up. There are enough men on slack time in the city shops to harvest the great apple crop that is going to waste, and to get in other crops only partly harvested. But as there is no social spirit for such things, there is, of course, no social organization of them, and the consequence is that the wise and necessary thing is left undone.

But adjustment of money conditions and industrial conditions is not difficult. Far more difficult is the adjustment of ideas. Since 1914 a great many persons have received brand new intellectual outfits. Many are beginning to think for the first time. It is astonishing—this awakening of the mind in people. Suddenly they open their eyes and realize that they are in the world. Then, with a thrill of independence, they realize that they can look at the world critically, stand apart from it, cross-examine it, and perhaps find it faulty.

The intoxication of thus assuming the masterful position of critic of the social system, which it is every man's right to assume, is unbalancing at first. The very young critic is very much unbalanced. He is strongly in favor of wiping it all off, like a false sum of figures on a slate, and starting out anew.

We have that situation to meet everywhere, but as humanity is a whole, every disorder is usually found to break out in one place. The anti-social virus engendered by the war has broken out in Russia. It is there that the disease can be studied under the best conditions. There we learn that the minority and not the majority determines destructive action. We learn also that men may decree social laws all they please, but if they come in conflict with natural laws it will be found that Nature is more inflexible than czars. We learn also that every such frenzy must finally come back to the old ways.

Russia will presently return to the old ways.

First, the return will be to Freedom in Work. Some people say, "Russia will have to go to work," but that does not describe the case. The fact is that poor Russia is at work, but her work counts for nothing. It is not free work. In the United States a workman works eight hours a day; in Russia, he works 12 to 14. In the United States, if a workman wishes to lay off for a day or a week, and is able to afford it, there is nothing to prevent him. In Russia, under Sovietism, the workman goes to work whether he wants to or not. The freedom of the citizen has disappeared in the discipline of a prison-like monotony in which all are treated alike.

Now, Freedom is made up of things like that—freedom to work a decent length of time and get a decent living out of it; Freedom to arrange the little personal details of one's own life. It is the aggregate of these minor forms of freedom which makes up the great idealistic Freedom; and it is these minor forms of Freedom which lubricate the everyday life of all of us. Russia must return to Freedom in work, and she will be forced to return by the very pressure of natural law.

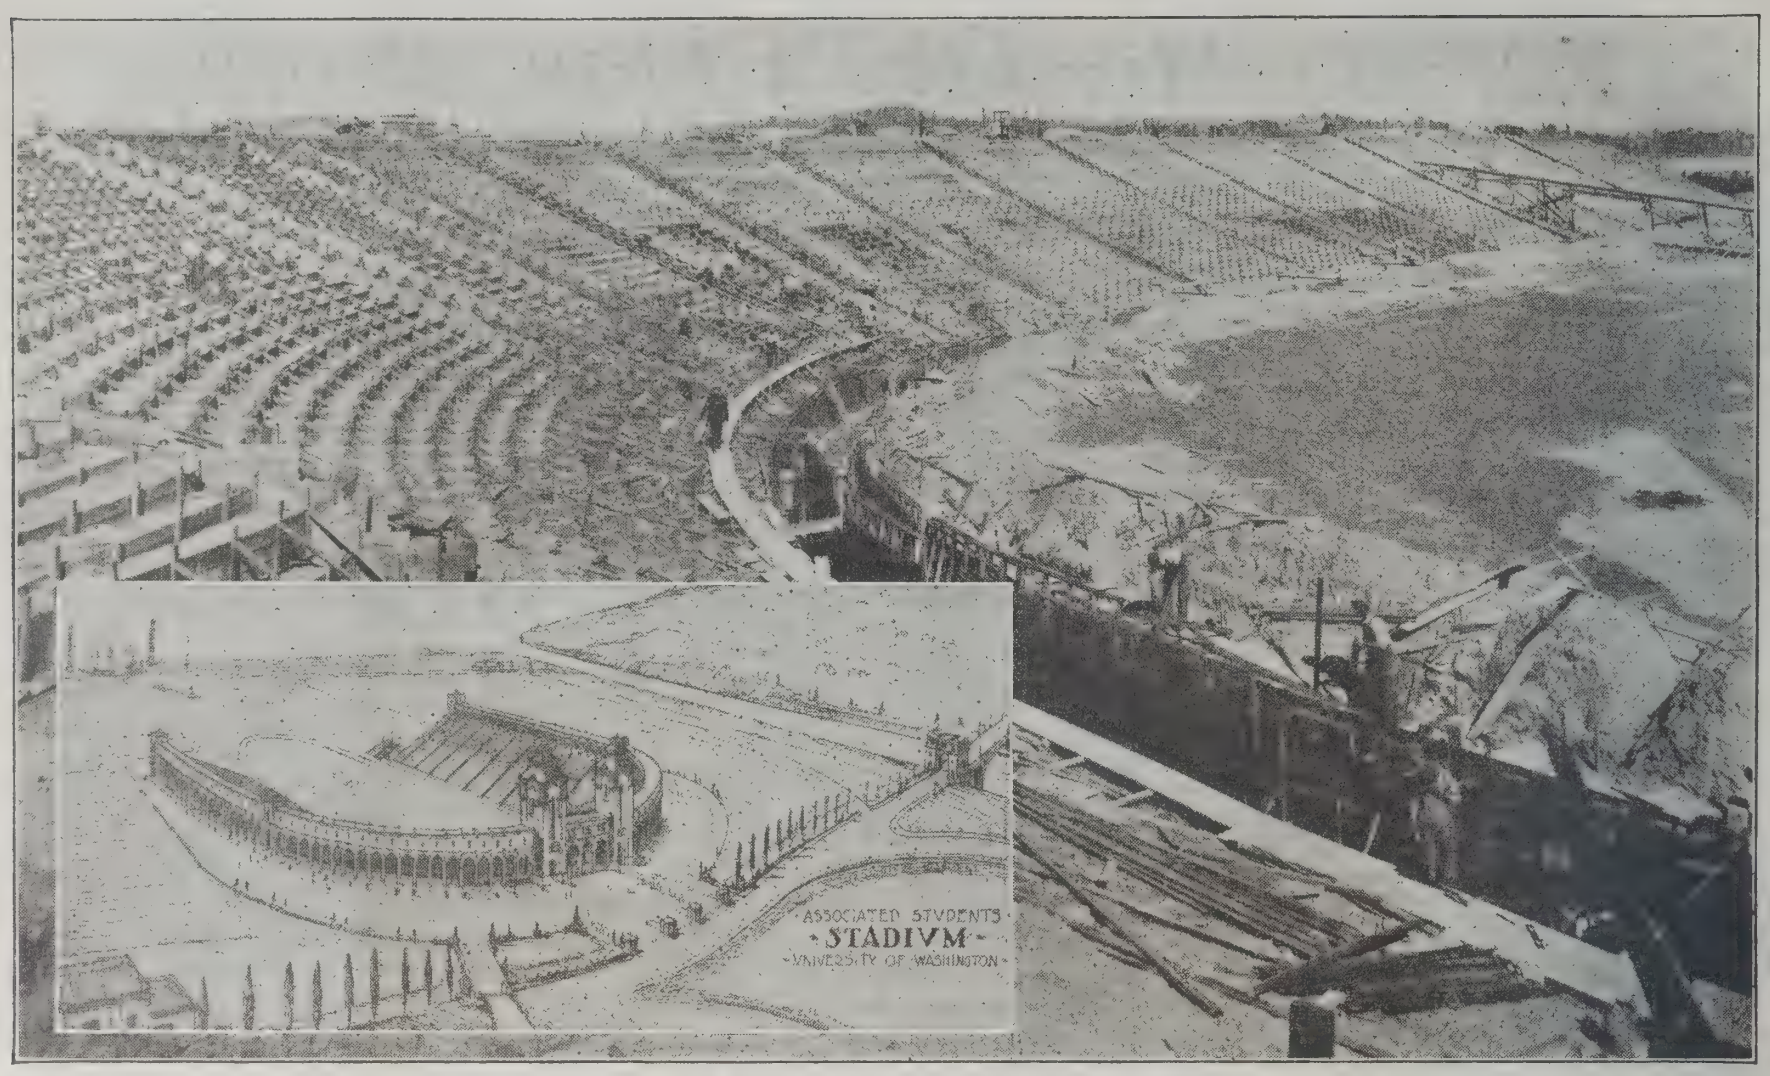
Again: Russia will have to return to the Service of the Masses by the Specialists. The Soviets said, "We don't want the experience and ability of those who formed the middle and upper classes; we can get along without it." But the result did not make good the boast. Russia could not get along without intelligence and experience. As soon as she began to run her factories by committees, they went to rack and ruin; there was more debate than production. As soon as they threw out the men who "knew how," tens of millions of dollars' worth of precious materials were spoiled, and the real support of the country was destroyed.

Why? Simply because a few, a very few persons, who "knew how" and who had previously put their "know how" at the disposal of the masses of the people, had been refused the chance to serve longer, because they belonged to "the middle class."

Let this Russian Soviet idea of class die out of the United States, just as it is dying out of Russia. The Soviets are combing the country now to find the starving *intelligentsia* whom they thought they could get along without. They are offering the engineers, the administrators, the manufacturers, the foremen and superintendents who fled, large sums of money if they will come back. Bolshevism is now crying for the brains and experience which she treated so ruthlessly at the first. The masses of the people are simply masses, without direction they find, and not one man in a thousand is fitted to direct others.

There is a very sinister element in this country, desirous of creeping in between the men who work with their hands and the men who think and plan for the men who work with their hands.

There never was in this country a traitor more dangerous than the man or party or race that seeks to split the American people into two opposing classes.



The same influence that drove the brains and experience and ability out of Russia, are busily engaged in raising a prejudice against the same qualities here.

One thing—a most precious possession of any nation, to be safeguarded at any cost, is the Unity of our People.

We must not suffer the stranger, the destroyer, the haters of happy humanity, to divide our people. In unity is American strength. In American disunity is the strength of the enemy of true Freedom.

THE period of talk will doubtless be succeeded by quiet action. Words do very well for programs, and for the frames of action; but fulfillment comes in deeds. We have always been more or less a wordy people. We have indulged, as a people, a penchant for orators. But we have discovered that it is mostly the silent men who do things. The old story about using so much steam in the whistle that there is none left for the wheels, is more than humor—it is philosophy. It is mighty easy to recreate the world in a speech, or reorganize society on paper. Men who actually put into practical operation the new thing, who prove its worth and get it established, may not go down in the list of word-producers, but they are the real statesmen.

Western University Builds Largest Stadium

The University of Washington stadium in course of construction and (insert) architect's drawing of the big bowl.

THE largest stadium in the United States and an amphitheater as commodious as any in the history of the world is being built on the campus of the University of Washington at Seattle, without the use of a horse, steam shovel or a scraper, the excavation being completed with the removal of 187,000 tons, with the employment of only forty men.

Competent engineers say that if the same unique system of construction had been followed in the building of the Yale Bowl at New Haven that that amphitheater would have cost $100,000 less and that the last seats, which were delayed to allow the ground to pack, could have been put into place two years earlier.

In building this stadium Seattle engineers are simply putting into practice the lessons they learned in the extensive and famous regrading of Seattle's business and residential section. Forty years ago what is now this city's business and residential areas was a string of high and irregular hills covered with a dense growth of fir and cedar. Seattle had to make its terrain level before the city could be built and what has been done in the metropolis of the Pacific Northwest in the last forty years is a tribute to the famous Seattle spirit.

When it came to building a stadium the engineers decided to make dirt run uphill and agreed that instead of using labor to form the steps and earth embankments on which the concrete is poured for seats, that water, which had the dirt in solution after picking it up when the hydraulic ram tore down uneven areas of the field, would deposit the earth in forms which were built up just as the seats are to be. It was a new departure in stadium construction and engineers who did not know what had been accomplished in Seattle's regrading said it was not possible. That it is not only possible but profitable and a time-saver is proved by results to date. Never in the history of the world has such accuracy and speed in stadium construction been attained as in the construction of the University of Washington stadium, say engineers who have seen the partially completed structure.

The ground was broken May 1, 1920, and the game between the University of Washington and Dartmouth November 27 will be played in the stadium, which will have a seating capacity of 30,000, and when the additional seats are placed the huge bowl will accommodate 60,000 spectators.

The site chosen is on the shore of Lake Washington and before the work was started it occupied a series of hills and valleys, rolling and irregular. It was decided to bring everything down to the level of the playing field and build up a sloping earth embankment for the seats, with the surplus earth to be used to level up the adjoining ground for practice fields and auto parking. Here was where the new construction feature entered.

A hydraulic giant was used to tear down the elevations and the water flowed to the center of the site at the rate of 2,000 yards a day. There was a settling pump lower than the grade and a pump then forced the water which held in solution sand, dirt and humus, up about forty feet to the top of the bank above where the seats were being constructed. On the sides of the amphitheater had been built wooden forms. The water flowed along and deposited a large percentage of the sand it held in solution. The dirt and humus, being lighter than sand, did not drop into the wooden forms but flowed off and back into the lake. The result was that with continual pumping of the saturated water sufficient sand was dropped into the forms to make permanent solid packing, just the shape desired and just the form of the mold.

The inside measurement of this huge stadium is sufficient to allow for a playing field 487 feet by 268 feet, and from the top of one row of seats to the row of seats on the opposite end will be 565 feet the long way of the field and 424 feet across.

The Great Land Hunger

NO HUNGER in all experience equals the human hunger for a bit of ground and a home on it. Nationalism has been much discussed recently; to some a bogie, to others a promise.

Czecho-Slovakia is the first country to attempt, in a practicable way, to solve that great land hunger with nationalism. The experiment is worth noting. In the first place, Czecho-Slovakia is easily the foremost of all the new states arising from the war. It has moved steadily along its appointed track, re-creating industries, instituting educational programs, saying little and sawing wood until today it is a solvent entity, and presents a model of a working democracy.

Neither the Czechs (or Bohemians), nor the Slovaks, nor the Moravians—the three races making up the state of Czecho-Slovakia—are Bolshevik; if you were to call them Socialists they would be astonished. They are Democrats, pure and simple; yet they have adopted nationalism in the great matter of land and, so far as can be judged, it works.

The law was passed April 16, 1919; it was passed unanimously by the National Assembly, representing all Czech political parties. By its provisions the state seizes land belonging to those who possess 150 hectares of arable land or 250 hectares of any kind of land including woods. This law invests the state with a sort of trusteeship over the seized land; in time it all will be given over to private persons, and on lease to public and private corporations.

A hectare is slightly less than 2½ acres. A cadastral acre, however, is an acre reckoned for taxation purposes and is a little more than a half hectare, being of less territory than an ordinary acre. In this article the hectare may be reckoned roughly at 2½ acres.

Now Bohemia, Slovakia and Moravia in 1914 were typical lands of the Old World. The peasants had nothing; a few landowners everything; these landowners were nobles, but not Bohemian nobles. They were the descendants of Magyars and others on whom the Austro-Hungarian crown had bestowed the estates.

Bohemia measures 5,195,000 hectares and at the last census had 6,769,548 inhabitants. There were then 868,402 separate landed possessions, and of these estates only 306,003 persons owned arable land. But 43 per cent of the Bohemian owners held an acre or less, a total of 373,273 ownerships being squeezed into 50,439 hectares. That is to say 45 per cent of the landowners held only 1 per cent of the land. At the extreme other end of the list 245 owners, holding more than 2,000 hectares each, held together 1,147,419 hectares or 28.3 per cent of the available area.

A study of the several divisions of pasturage, orchards, meadows, gardens, woods, lakes and moors would show the same disproportionate ownership which, of course, was common to all other aristocratically settled countries.

Moravia, with more than 2,600,000 inhabitants and 2,222,000 hectares, had only 275,000 persons owning arable land. Similar figures apply to Slovakia, to Silesia, and to neighboring areas.

Thus the land hunger throughout the peoples subject to the old central empires, and more particularly to the varied races under the Hapsburgs, was completely stifled.

How did this come about? History tells the story: the dominant position of the chiefs, the influence of despotic rulers and of the church. As early as the twelfth century vast Czech areas had been concentrated in large estates, and these estates themselves were consolidated again into still larger possessions by families among the nobles who intermarried. The Hapsburg rulers placed their favorites on the land, and from them came many of the estates whose names indicate very clearly their origin: such as Liechtenstein, Waldstein, Marradas, and others.

In fact after the Hapsburgs had finished, scarcely a quarter of the land remained in the hands of the original owners.

The fact of the matter is—and it explains the success of the new land office of Czecho-Slovakia—the land reform is so self-evidently and universally the program of the whole people, that there is no party to protest against it. The land office has started its work, and thousands of the most needy persons are becoming owners of land; the work is proceeding quietly and in good order, as does everything else in this sane little state. The idea is supported by the opinion of the whole people, and this insures its success.

It is certainly no utopia; it is the oldest and deepest of all man's material desires.

To Make a State a Better Home for Children

Shawnee Rotarians Seek to Build Ideal Cities in Oklahoma

WHAT do most people think about when they hear the name of the sovereign state of Oklahoma? The answer is easy. They think of oil and probably of some oil stocks they happen to hold.

So much publicity has been given Oklahoma by the promoters of oil companies that the public has acquired an impression the state grows derricks in about the same profusion that a cactus grows spines and that the one interest of the inhabitants is in getting as much profit as is possible out of their great natural resource, without much regard as to how they get it.

Nothing could be further from the truth. Oklahoma is new and it is rich but it has a good many interests besides its wealth and some of them could be copied to excellent advantage by a number of older and more firmly established commonwealths.

For instance while some of the states which profess to be leaders in social development are complacently preening themselves over their standings in the census returns and talking about nothing except how big they are, Oklahoma has launched a campaign to determine which of her cities is the best community in which to rear a family.

Shawnee started the movement. Her rotary club had heard of the success of similar campaigns in Kansas a few years ago and asked William A. McKeever of the extension division of the University of Kansas to visit them and outline a program.

Dr. McKeever is probably the best known authority on child welfare work in the United States. It was he who first called the attention of the nation to the fact that while it was giving much attention and spending tremendous sums on improving the breed of cattle, it was forgetting to develop its greatest asset—its boys and girls. There was no trouble, Dr. McKeever said, in getting advice from expert authorities on the proper methods of bringing up an orphan calf, of taming a recreant mule or of training a balky horse. But when it came to children parents had to work out their problems alone. He advocated community campaigns as one method of awakening interest in the coming generations and he demonstrated the value of his idea in more than 40 cities of his home state.

That is the man for us, said the Shawnee rotarians and they sent for him. "We want," they said, "to make Oklahoma the best state in the Union in which to found a home and raise a family. What shall we do?" Acting on Dr. McKeever's advice the rotary club announced that it believed Shawnee to be the best city in Oklahoma, and that it was willing to contest for the title and a prize of $2,500 with any medium-sized community in Oklahoma. The contest, which will last for one year, will be decided on 10 points, the scoring to be done by a body of impartial judges who will visit every community and measure its standing.

Play comes first on the list and the judges will look to the facilities for adequate, safeguarded play.

Industry is next and here attention will be given to industrial training at school, character building, employment during vacation, condition of employment of juveniles under 16 and systematic thrift instruction.

Management, equipment, methods of contact with community, modern methods of instruction, management of athletics, adequateness of number of teachers, salaries, and the like.

Modern methods of nursing, health inspection, clinics, hospital service, dental inspection, handling of contagious disease, and the like.

Management of the Boy Scouts, Girl Scouts or Campfire Girls, facilities for camping, hiking, boating, service work of scouting organizations. Lessons in Americanization.

Management of the motion picture, the dance situation, the cigaret problem, the theater, and the general club life of the young.

Facilities for weekly social experience of all adolescent young people, social management in the high school, and the churches and homes.

Youths in young people's church societies, Y. M. C. A., Y. W. C. A., enrollment, management methods in Sunday schools, how these bodies meet the play and recreational interests of the young.

Clubs and societies of men and women studying and dealing constructively with juvenile problems, projects accomplished and under way, and the like.

Adequateness of housing, health, sanitation, and other comforts of industrial classes and of the families of lower economic status; together with remediable methods and measures.

A standard plan of campaign will be adopted in every community which enters the contest and will be closely followed for a year before the awards are made. The home, the church, the school and the community will all be represented by committees, with the superintendent of schools as ex-officio chairman of the combined central committees.

There will be a committee of three or more on home life and home training of the children with some mother and member of a woman's club as chairman:

A committee on school method and equipment with the superintendent of schools as chairman and with two or more interested patrons as members;

A committee on church and Sunday school training and advantages, with chairman and personnel to be selected by the clergymen of the city;

A committee on the community welfare of the young, welfare of the children—playground and social entertainment of the growing population—with a member of some men's club as chairman and other members selected at large.

The points which will be to the cities' greatest credit in the scoring are not the points which the residents usually show visitors. For instance, there will be no credits for the number of homes on "millionaire's row" but there will be credits for good housing conditions, substantial dwellings, and for the number of mother's clubs and parent-teachers' organizations.

The grading of the schools will be based on the number, construction and condition of the buildings; the efficiency of the teachers' methods of instruction, equipment, social program, athletics, playgrounds and—this last should be noted—teachers' salaries.

The churches will be scored on the work they do in their young people's organizations and the manner in which they tie this up with real service to the community.

The community will be called on to make possible the full development of the programs of the other three bodies. It will be held that it is the community's duty to provide supervised playgrounds, to keep clean streets, to wipe out unsightly spots, to force the maintenance of clean alleys and backyards and to regulate forms of commercial amusements.

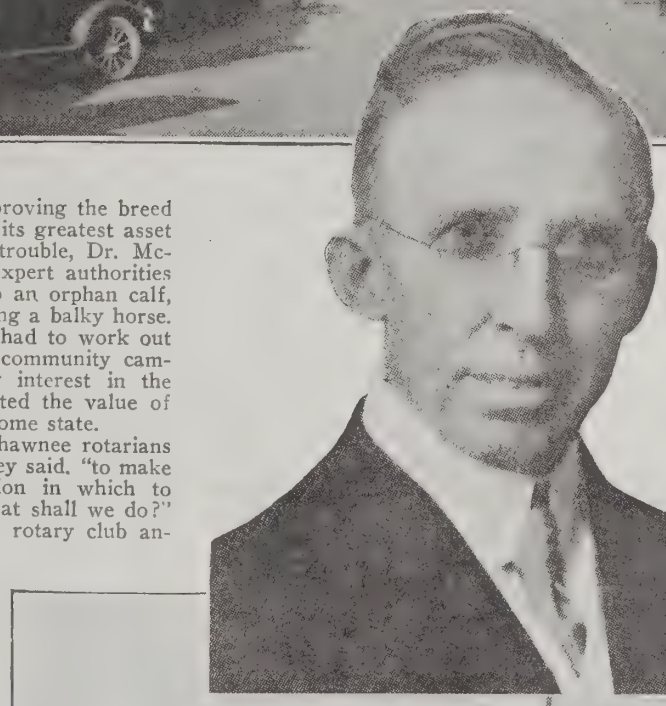
Objectionable pool rooms, doubtful picture shows, and questionable enterprises of every kind which cater to the boys and girls must be regulated and, so far as is possible, displaced by community athletics, pageantry, amateur dramatics and other interesting means of enlisting the enthusiasm and attention of children.

It may be noted that while much attention is to be given to facilities for play, the matter of work has by no means been overlooked. Particular stress is to be laid on employment for children and youths during the summer or vacation months. At this period of the year, when every community turns its youngsters loose to their own devices, giving them nothing in the way of opportunities for supervised play, the cities entering this campaign will be required to show that there has been systematic teaching of thrift and that methods of employment have been provided. Gardening will be on the summer program and prizes will, of course, be offered for the best results. Repair work and community service, including the mowing of lawns, the washing of automobiles, the cleaning of backyards and alleys, whitewashing fences, window washing and renovation of unsightly spots in or about the city, will be included in the summer program and the workers, always supervised, will be paid by the city or its business men's association for their labors.

Another plan which the cities will adopt will be to enlist them in a practical carpentry course in which they will manufacture much of the equipment used on the playgrounds as well as flytraps, bird houses, sand boxes and summer shelters for the city parks, and as wide a variety of objects as is possible, so that the individuality of all may be expressed.

As an incentive to thrift, banks and business houses are to be asked to provide cash prizes for the groups which accumulate the largest deposits of earned funds during the summer.

It will be seen that the purpose of all these programs is to associate industry, thrift and community service in such a manner that they become inseparable. The child, for instance, will not be taught industry without learning also a lesson in community spirit, nor without being taught something of the value of thrift. And finally, through his experience as a member of a group, he will learn the value of time, cooperation and of concerted effort.



It is recorded that when Kansas tried out a modification of this plan the cities which entered became so interested before the close of the campaign that they wiped out every questionable pool room, stopped the surreptitious sale of cigarets and improved their schools, their streets and their recreational opportunities in a manner which far exceeded the expectations of the university. Many of the cities gained in population as a result of the campaign and it was even shown that in a large number of instances Kansas drew families from outside states.

Oklahoma hopes for great results. The whole state is bound up in the movement originated at Shawnee and it is believed that when this campaign is completed, one will be launched among the smaller towns and villages.

They want something better than a slogan in Oklahoma. They want better homes, better schools, better social conditions and they propose to get them. So—after all—they promote something besides oil deals in Oklahoma.

Ideals—for instance.

Above: The business section of Shawnee, showing the wide, clean, well-paved streets typical of western towns. Below: The Shawnee high school building. Insert: Dr. William A. McKeever, of the University of Kansas, whose work it is to interest the public in better crops of girls and boys.

Jews Use the Peace Conference to Bind Poland

Jews of Poland Demanded a State Within a State: Peace Conference Established the Saturday-Sabbath and Gave Jews Public Money

THERE is one difference between the Polish report of Sir Stuart Samuel and those of the others, which illustrates a difference between the Jewish mind and the general mind. The type of mind represented by the other investigators, Captain Wright, Brigadier General Jadwin, Sir H. Rumbold and even Henry Morgenthau, is the type of mind which looks behind events for causes.

Here is, for illustration, trouble between the Jews and other people. It is a continuous situation. There is always trouble between the two. We seldom hear of it, however, until the Jew begins to get the worst of it. As long as the Jew remains on top, making the Gentile serve the Jewish plan, there is no publicity whatever. The Gentiles may complain as much as they like, may protest and rebel—no international commissions arrive to investigate the matter.

Trouble between the Jews and other people is designated as trouble only when it begins to grow inconvenient for the Jew. It is then that he sends the cry of "persecution" around the earth, though the plain fact may be that he is only being nipped at his own game. The Poles saw how the Jews clung together in the most admirable teamwork, a minority absolutely controlling the majority because the minority formed a close corporation and the majority did not. So the Poles said: "We will take a leaf out of the Jews' own book. They work co-operatively among themselves; we, therefore, will work co-operatively among ourselves." Which they did, and at once the cry of "persecution" resounded loud and long; propaganda was begun against the good name of the Poles, more resentment followed, regrettable violence ensued, and the dispute still continues.

Jewish reports of these disturbances rarely go beyond the fact that Jews are suffering from certain acts of the Polish populace. Incident after incident is given with full detail, and with a very apparent journalistic appreciation of horror. Names, dates, places, circumstances are all in order.

Searching for the "Why" of Events

VERY well. It is no part of this article to deny or minimize the suffering of Jews wherever or for whatever cause it may occur. There is nothing whatever to be said in extenuation of injustice inflicted on the humblest human being. The murder of even one person, the terrorizing of even one family, is a very terrible thing to contemplate. It is a great pity that the world has become so accustomed to the piled-up tales of horror that it no longer has any sensibilities left to feel the shame and degradation of these things. From the days of Belgium onward, all races in Europe have suffered, and by sympathy all races in America have suffered with them, though it is a fact that we hear more, far more, about the sufferings of the Jews than of any other people.

There is, however, this reaction of the practical mind: Why do these things occur? Grant that robberies, assaults and murders described in the complaints have occurred, *why should they occur?*

Are the Polish people naturally given to perpetrating such acts? Have such acts marked the residence of the Jews in Poland for the last 800 years? And if the Polish people are not naturally abusive, if the story of the Jews' residence in Poland has been mostly pleasant, what causes the change now?—that is the way the practical general mind works. It seeks to know the background.

Mr. Morgenthau, apparently, put in too much of this background, though at that he put in very much less than the other investigators, except Mr. Samuel. Therefore, Mr. Morgenthau's report was pigeonholed by American Jewry, because the facts make very poor material for the kind of propaganda which American Jewish leaders had in mind. Apparently they did not dare publicly to criticize or renounce his report; they simply passed it over. Captain Wright, who endeavored to put in all the background he could find to make Polish conditions comprehensible to the British people, has been handled insultingly by the Jewish press. They don't want investigation. They want sympathy for themselves and denunciation for the Poles.

Eighteen Persons Killed in Poland Proper

IN AMERICA we are inclined to believe that every condition is explainable: it may be reprehensible, but it is intelligible; we believe that the explanation is the first step toward the remedy.

Mr. Morgenthau does not speak of "pogroms" at all. In this he sets an example that certain hysterical American Jews ought to follow. The present series of articles in THE DEARBORN INDEPENDENT is a "pogrom" (some Jewish spokesmen speak as if each separate article were a "pogrom") in the hectic but uninstructive oratory of Hebrew lodge meetings. But Mr. Morgenthau exercises more precision in the use of words. He says:

> "The mission has purposely avoided the use of the word 'pogrom,' as the word is applied to everything from petty outrages to premeditated and carefully organized massacres . . . ."

On one point all the reports agree, namely, that the unjust killing of Jews has been on a scale so much smaller than that alleged by the propagandists that there is no comparison. In that part of Poland where war disorder was less common, 18 persons were unjustly deprived of their lives. For the whole territory during the entire period when it was being overrun by various elements, Sir Stuart Samuel admits, apparently with reluctance, that he can count only 348. Captain Wright says: "I estimate that not more than 200 or 300 have been unjustly killed. One would be too many, but, taking these casualties as a standard with which to measure the excesses committed against them, I am more astonished at their smallness than their greatness." Sir H. Rumbold says: "If the excesses had been encouraged or organized by the civil and military authorities, the number of victims would probably have been much greater."

Composite Report of Lemberg Excesses

THAT the reader may see how the various reports run with reference to specific charges of brutality, the agreements and divergences are set down. Look at the reports concerning what happened at Lemberg.

1. The excesses occurred November 21-23, 1918. The city was taken by Ukrainian troops, formerly in the Austrian service. (Samuel, Morgenthau, Wright, Jadwin.)

2. "General Monczyunski raised a Polish army, about 1,500 in number, consisting of men, women, boys, some of them criminals, and, after a severe struggle, succeeded in capturing half the city, the other half of which remained in the occupation of the Ukrainians." (Samuel.) "A few hundred Polish boys, combined with numerous volunteers of doubtful character, recaptured about half the city and held it until the arrival of Polish reinforcements on November 21." (Morgenthau.) "When the German troops revolted all over Poland at the time of the armistice, and the whole edifice of German organization fell to the ground in a day, a few Polish officers raised a small volunteer force in Lemberg, numbering between 1,000 and 2,000, which was composed of boys, roughs and criminals, and even women in uniform. For nearly a fortnight they fought in the streets against the Ukrainians and on the arrival of a similar force . . . . drove the Ukrainians out of town. This was really a splendid feat of arms." (Captain Wright.)

3. "The Jewish part of the population of Lemberg declared itself to be neutral." (Samuel.)

"The Jewish population declared themselves neutral, but the fact that the Jewish quarter lay within the section occupied by the Ukrainians, and that the Jews had organized their own militia and, further, the rumor that some of the Jewish population had fired upon the soldiery, stimulated among the Polish volunteers an anti-Semitic bias that readily communicated itself to the relieving troops." (Morgenthau.)

"During this struggle the Jews proclaimed themselves neutral; but, though I do not think they gave any armed assistance to the Ukrainians, their neutrality was highly benevolent to the Ukrainians and probably helpful. They thought the Ukrainians would win." (Captain Wright.)

4. "In the result *none of the military commanders* responsible for these events *has been punished.*" (Samuel.) "As early as December 24, 1918, the Polish Government, through the ministry of justice, began a strict investigation of the events of November 21 and 23. . . . In spite of the crowded dockets of the local courts, where over 7,000 cases are now pending, 164 persons, ten of them Jews, have been tried for complicity in the November disorders, and numerous similar cases await disposal. Forty-four persons are under sentences ranging from 10 days to 18 months. Aside from the civil courts, *the local court-martial has sentenced military persons to confinement for as long as three years* for lawlessness during the period in question." (Morgenthau.) Speaking of the general subject of punishment, Captain Wright says: "The Government has inflicted a good deal, though an insufficient amount, of punishment; these punishments it has never published, for fear of Polish public opinion." And Brigadier General Jadwin, of the United States Mission, says: "If complaints as to slowness and uncertainty of military and government punishments and relief were heard, as they were, it seemed nevertheless to indicate that orderly process of government was in operation."

5. "*No compensation has been paid* for the damage done." (Samuel.)

"This mission is advised that on the basis of official investigations the government *has begun the payment of claims* for damages resulting from these events." (Morgenthau.)

"*Payments had begun to be made* in Wilna, Pinsk and Lemberg before our departure from Poland." (General Jadwin.)

The occurrences in Lemberg were bad enough, to be sure. But Sir Stuart Samuel let it be understood that all the blame rested with the Poles. The other investigators gave reports that explain the matter, although no report could excuse it. And all but Samuel agreed that the Polish Government did what it could to repair what had occurred and to prevent recurrences. This from the American report is worth considering: "General Jadwin was present at the taking of Minsk and a personal witness of the strenuous efforts of the military authorities toward preventing acts of violence." The fact seems to be that as soon as any sort of order could be brought out of the chaos of war, the disorder ceased. And yet we read, even today in our newspapers, of "thousands and tens of thousands of Jews being slaughtered in Poland."

Further, to indicate that these events did not occur without Jewish provocation to a certain extent, there is the case of Pinsk. This was on April 5, 1919.

1. Pinsk had been recaptured from the Bolsheviki a short time before. The population was overwhelmingly Jewish, only 25 per cent being Polish (General Jadwin, Captain Wright.) The Polish officer had only a very small detachment of men, and the Bolshevist lines were quite close. The Polish officer was treated with coldness by the Jews, and he suspected them of friendly relations with the Bolsheviki; he was very anxious. He had posted notices that any unauthorized meeting would be punishable by death. (Captain Wright.)

2. The Government Organizer of Co-operative societies had given permission for the Jewish co-operatives to meet for discussion of the plan to join other co-operatives. (Samuel, Morgenthau, Wright.)

Jewish Soldiers Act as Informers

3. "It seems that *two Polish soldiers* . . . . and another soldier . . . . informed the military authorities that they had information that the Jews intended to hold a Bolshevik meeting on Saturday in what is known as the People's House, being the headquarters of the Zionists." (Samuel.) "This meeting took place in the offices of the Zionist organization, which is very anti-Polish." (Wright.)

". . . . it is recognized that information of Bolshevist activities in Pinsk had been received by *two Jewish soldiers* . . . " (Morgenthau.)

"The town commander with judgment unbalanced by fear of a Bolshevik uprising of which he had been forewarned by *two Jewish soldier* informers . . . ." (General Jadwin.)

"After the meeting had ended and been formally closed, a great many members of the co-operative association remained in the same room talking together; other members of the Zionist organization, including ladies, were in the room at the same time. This collection of people must have presented the appearance of a meeting, and I think the members remaining in one room were numerous enough technically to constitute a meeting. *There was some insolence in this and the previous behavior of the Jews: Sir Stuart Samuel pointed out to the witnesses that their authorized meeting itself had been a breach of the Sabbath,* and therefore a grave religious offense." (Captain Wright.)

All of the investigators agree in denouncing what followed. Captain Wright says that the Polish officer would hardly have acted with such promptitude if the prisoners had been others than Jews.

General Jadwin sums it up thus: "The Pinsk outrage . . . . was a purely military affair. The town commander with judgment unbalanced by fear of a Bolshevik uprising of which he had been forewarned by *two Jewish soldier informers* sought to terrorize the Jewish population (about 75 per cent of the whole) by the execution of 35 Jewish citizens without investigation or trial, by imprisoning and beating others and by wholesale threats against all Jews. No share in this action can be attributed to any military official

higher up, to any of the Polish civil officials, nor to the few Poles resident in that district of White Russia."

Sir Stuart says: "Under the present local administration Pinsk is once more peaceful, and the relations between the Christian and non-Christian inhabitants have become normal."

It is sometimes forgotten here in the United States that for Poland the war is not yet over. Poland is now a free nation—on paper—but her freedom seems to be a day-to-day tenure, dependent on fighting. Bolshevism made serious inroads on her. Wherever the Bolshevik Red armies swept across Poland, the Jews met them with welcomes. This is no longer denied, even in the United States: it is explained by the statement that the Bolsheviki are more friendly to the Jews than are the Poles—a statement which readers of our recent articles on the Jewish character of Sovietism can well understand.

When the Poles beat back the Reds, they commonly found that the Jews had already set up Sovietism, as if they had long awaited it and were well prepared. It is scarcely strange, therefore, that the Poles still retain their suspicions.

The Jews do not want to become Poles. That is the root of the present difficulty between the two peoples. Sir Stuart Samuel barely touches it—"On several occasions the resentment of the soldiery and civil population was aroused by the Zionists' claim to *Jewish nationality as opposed to Polish nationality.*" Mr. Morgenthau goes a step further—"This had led to a conflict with the nationalist declarations of some of the *Jewish organizations which desire to establish cultural autonomy financially supported by the State.*" Mr. Morgenthau, you will observe, gives a wider peep into conditions.

The Jews' Anti-National Demand

BUT the best description of the situation is given in the report of Captain Wright:—"Their (the Jews') party program in Poland is to have *all Jews on a separate register.* The Jews thus registered are *to elect a representative body of Jews,* with extensive powers of legislation and *taxation;* e. g., it could tax for purposes of emigration. This body to be *handed over by the Polish state a proportionate amount of money* to spend on Jewish charitable and financial institutions. Besides this separate organization, a number of seats proportionate to their numbers to be set aside in every local and in the national legislature. A sixth or seventh of the Polish Diet to be *occupied only by Jews to be elected only by Jews.* Some Jews also demand separate law courts, or at least the right to use Yiddish as well as Polish in legal proceedings. This is the practical program, but the ambition of the advanced section is *national personal autonomy* granted in the Ukraine by one of the ephemeral governments of the Ukraine, the Ukrainian Central Rada, on January 9, 1918, and called the Statute of National Personal Autonomy, of which I have a copy. It organizes the Jews as a nation with full sovereign powers; the Ukrainian *bank notes were printed in Yiddish* as well as in Ukrainian."

People sometimes ask, where is the proof of the program of the Protocols? It is everywhere the Jewish leaders have attained power, and everywhere they are striving for power. The Protocols can be written out of Jewish rabbinical writings; they can be written out of Jewish tendencies in the United States; they can be written out of Jewish demands in the Balkans; they can be written out of Jewish achievements in Russia. They represent the Jewish program, ideal and real, at every stage of modern history.

Do you ever hear of this Jewish program in Poland when you are invited to sympathize with the 250,000 Jews who are being brought from Poland to the United States? Will these people leave their ideas outside New York Harbor?

Incidentally, Captain Wright's full investigation of the Jewish program may throw some light on the refusal of American Jews to circulate his report, although it was attached to the report of Sir Stuart Samuel which is being so widely circulated.

However, that his government at home might fully understand the situation, Captain Wright draws an illustrative parallel:

"If the Jews in England—after multiplying their numbers by twenty or thirty—demanded that the Jewish Board of Guardians should have extensive powers, including the right to tax for purposes of emigration, and that a separate number of seats should be set aside in the London County Council, the Manchester Town Council, the House of Commons, and the House of Lords, to be occupied only by Jews chosen by Jews; that the president of the board of education should hand over yearly to the Jews sums proportionate to their numbers; if some were to demand the right to have separate Jewish law courts, or at least to be allowed to use Yiddish as well as English in the King's Bench and Chancery Division; if the most advanced even looked forward to a time when Bank of England notes were to be printed in Yiddish as well as in English, then they might well find public opinion, even in England, less well disposed to them . . . ."

In view of this state of affairs, it cannot be regarded as a fact of minor significance that the Jewish investigators who must have known all this virtually concealed it, and that the other investigators brought it forth to general knowledge. Neither is it of minor significance that the Jewish press has absolutely suppressed these facts even while pretending to give the results of the British Mission's investigations. Insulting references have been made to Captain Wright's report in a Jewish publication of the better class, because he made references to certain practices which are common among the Jews in Poland. It may be said, however, that the references made by Captain Wright are in great restraint compared with the number given in the recent book by Arthur Goodhart. Whether Mr. Goodhart is a Jew or not, the present writer cannot now say. He is a Fellow of Corpus Christi College, Cambridge. He is "lately Captain, United States Army." He was transferred from the army at the suggestion of Mr. Morgenthau, to act as counsel for the Mission. And he says on page 161—"After dinner Mr. Morgenthau attended a meeting of the B'nai B'rith Lodge, the only chapter of this Jewish organization in Poland. No branches had been permitted in Russia before the war, as it was a secret society and therefore illegal in the Czar's Empire. Major Otto and I, not being members, walked round the town." Mr. Goodhart, as counsel of the American mission, makes an excellent witness as to the kind of people who are coming in such large numbers to this country. But their sense of their own political importance and power is the principal point for Americans to consider.

The Peace Conference Binds Poland

THE Peace Conference did not tend to bring unity in Poland; it rather established the disunity for as long a period as the Treaty of Versailles remains to rule the world. The reader has just seen Captain Wright's description of what the Jews demanded. Let the reader now understand what the Peace Conference decreed.

Poland is prohibited from having an election on Saturday. Poland is prohibited from having a registration on Saturday. The Jewish Sabbath is established by law, and government and courts must govern themselves accordingly. Do what you like on Sunday—order elections on Sunday, as the Poles sometimes do—but not Saturday; it is the Jews' Sabbath!

"Article 11—Jews shall not be compelled to perform *any act which constitutes a violation of their Sabbath,* nor shall they be placed under any disability by reason of their refusal to attend courts of law or to perform any legal business on their *Sabbath* . . . . Poland declares her intention to refrain from ordering or permitting elections, whether general or local, to be held on a *Saturday,* nor will registration for electoral or other purposes be compelled to be performed on a *Saturday.*"

What the Bolsheviki did in Russia, the Peace Conference did in Poland—established the Jewish Sabbath.

The people who saw this strange setting up of Jewish customs as a part of the law of the land, one of the authorities for such action being the President of the United States, are now flocking to the United States in large numbers. Is it unreasonable for them to believe that if the President of the United States could bind Poland to Jewish custom, it is all right to bind the United States too?

Moreover, the Jewish separate schools were established by law in Poland. Poland's great trouble has resulted from her lack of schools in which *all* the population could imbibe Polish ideals expressed in the Polish language. The Peace Conference authorizes the continuance of that source of trouble.

In Article 11, "the Jews" were mentioned. In Article 9, the term used is "Polish nationals." The reader will save himself a great deal of misunderstanding in the perusal of European news if he will translate the clause "racial, religious and linguistic minorities" to mean simply Jews. They are the "minority" that is at the bottom of most of the difficulty, and they are the minority that is most heard of. It was this minority that dominated the Peace Conference.

"Article 9—Poland will provide in the educational system in towns and districts in which a considerable proportion of Polish nationals of other than Polish speech are residents, adequate facilities for insuring that in the primary schools instruction shall be given to the children of such Polish nationals through the medium of their own language. . . .

"In towns and districts where there is a considerable proportion of Polish nationals belonging to racial, linguistic or religious minorities, *these minorities shall be assured an equitable share in the enjoyment and application of the sums which may be provided out of public funds* under the state, municipal or other budgets for education, religious or charitable purposes."

Public Money for Jewish Purposes

BUT even that is not all. The Polish State is to hand over the money, but the Jews will distribute it:

"Educational committees appointed locally by the *Jewish* communities of Poland will, subject to the general control of the state, provide for the distribution of the proportional share of the public funds allocated to *Jewish* schools in accordance with Article 9. . . ."

It is most amazing how "racial minorities" are dropped the moment money comes into view, and the definite term "Jew" is substituted.

More than all this, "the United States of America, the British Empire, France, Italy, and Japan, the principal allied and associated powers, on the one hand; and Poland, on the other hand," (so the text of the treaty begins) together make of all these special privileges, not a national agreement on the part of hard-pressed Poland, but an international demand on the part of the League of Nations. Article 12 stipulates that all the agreements affecting "racial, linguistic and religious minorities," which is mere diplomatic camouflage for "Jews," shall be placed under the guaranty of the League of Nations. This lifts the Jews in Poland completely out of Polish obligation. All they will have to do is to complain to the League of Nations—and International Jewry will do the rest.

The United States was a party toward the writing of these stipulations into the treaty. The American people are not yet a party to their enforcement.

There are a quarter of a million of these Jews coming to the United States from Poland. You have read their demands in Poland. You have read their achievements in the Peace Conference.

Do you say, as an American citizen, that you are ready to take for the United States the dose of Jewish medicine, which the Peace Conference gave to Poland?

Do you say, in view of what has been said about the whole situation, that the Jews are showing anything besides a wicked and gloating spirit of revenge in the way they have propagandized against Poland after humiliating her in the Peace Conference?

A book containing over 200 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

The Jewish propaganda play which appeared in Washington under the title "Undesirable Friends" is now appearing in New York as "The Unwritten Chapter." Regarding it, one New York dramatic critic writes in his paper: "Dressed out in patches of history retailored to fit, Louis Mann stepped on to the stage of the Astor Theater last evening as Haym Salomon, a hitherto little known hero of the Revolutionary War with whom the authors in the case are determined the present generation shall become acquainted, even if they have to be anachronistic about it. In this play, packed with noble sentiments about America and the Jews who helped to make these United States what they are until there seemed nothing left to say on either side, one is presented with about a three-quarter length portrait of the man who was Israelite, banker and patriot all in one. Before the portrait is finished, a goodly portion of history has been shown the door, a certain amount has been made on the spot, and what is fact has been so combined with what is fancy," and so on.

Although Jews insist that the immigration laws of "the outside world" shall be very lenient to them, they have made the immigration laws of Palestine so stringent that it would be difficult for many Jews to get in.

The Jewish character of the immigration now passing through Ellis Island is attested by the fact that most of the Sunday afternoon entertainments given on the island are purely Jewish in character.

There was a rather small riot in Jerusalem at Easter. The Jews of the city have already collected $100,000 in damages from the new Palestine Government under Sir Stuart Samuel.

When Sir Stuart Samuel made his report to the British Government, he recommended that the British representative be given a secretary who could speak Yiddish. This, of course, means a Jew. It is becoming quite the custom, we understand, to equip Polish diplomats, as well as diplomats accredited to Poland, with Jewish secretaries. But Sir H. Rumbold, who was British representative in Poland when Sir Stuart visited there, deprecated the recommendation, intimating that such a secretary would hardly be more than an agent watching the interests of the Jews as those interests were fixed by the Peace Conference.

The "Palestine Directory" lists nine architects, 44 lawyers, 32 stockbrokers, 52 wine and liquor dealers and 45 confectioners.

There are 110 Jewish students in McGill University, Montreal, Canada.

The inventor of Esperanto, the universal language, was a Jew.

The Era of Motor Transportation in England

Fleets of Charabancs and Lorries Fill Highways, Carry Merchandise and Passengers to All Corners of Island

By W. P. CROZIER

Manchester, England, October—(By Mail).

A FEW months ago, when the ministry of transport was established in this country, there were many critics who said that the new minister, Sir Eric Geddes (who was a railway manager) meant to use his office for the glorification of the railways and the diminution of the roads and motor transport. There is no sign of this as yet, but whether it be so or not, we are becoming more and more conscious that the era of the motor vehicle and the revival of the long neglected road are now upon us.

The phenomenon is one which strikes the mind at every turn. It is not only a question of light motor cars, though these during the later stages of the war and since the armistice have increased enormously in number, but also of heavier traffic of every description. Every big town now has its fleets of charabancs for travel and for pleasure, and if on occasion a tramway strike breaks out, the troubles of the public are mitigated to an astonishing degree by the influx of squadrons of charabancs from the adjoining towns. In many districts it is notorious that a passenger may reach his destination more quickly, comfortably and cheaply by charabanc than by railway, for the simple reason that the motor vehicle goes as straight as is possible to its destination, taking the difficulties as they come, whereas the railway follows a fixed, undeviating course to which traffic of all kinds, if it would use the railway at all, is obliged to conform. Besides the charabancs, motor buses are multiplying enormously. More than anything else they are helping to link up the villages of England with the market towns on which they center.

More important than these vehicles from the commercial point of view are the motor lorries, which are to be seen in droves on our principal roads distributing merchandise from one end of the country to the other.

Once or twice recently in Lancashire an official census has been taken which illustrates the extent and growth of this new motor traffic. For seven days, during twelve hours a day, an account was kept on the road between Preston and Blackpool, the popular Lancashire seaside resort. Two thousand three hundred and eighty-one motor omnibuses and charabancs, 879 motor lorries and 30 motor lorry trailers passed along the road. On the road from Preston to Lancaster in the same period there were 1,746 motor buses and charabancs, 902 lorries and 64 trailers, while at a chosen point of the Liverpool-Manchester road there were 3,267 lorries and 589 trailers. Another census has given us a comparison between recent figures on the Manchester-Liverpool road and figures for seven days in June, 1912. To take only the heavy commercial traffic, there were 94 motor lorries in 1912 and only one trailer, whereas in the chosen period this year there were 2,010 motor lorries and 336 trailers. Taking all kinds of motor vehicles, the traffic this year was more than seven times as numerous and more than ten times as heavy in tons as it was in 1912. And besides all this expansion, with its obvious significance to the energy and industry of the country, there is the opening of the era of the power-driven machine in the fields, which means a new chapter in agriculture and perhaps, if we are quick enough to adopt the lessons of the times, a revival in the efficiency and prosperity of what is still our largest industry.

Like many another transformation in our social state this outburst of motor transport dates from the war. It is roughly estimated that during the war there was an increase of some twenty-five thousand motor vehicles in Lancashire and Yorkshire alone. Everyone knows now how in France and Belgium the army discovered the incalculable value of the ubiquitous motor in running the campaign. A large part both of the men and of the supplies for the great offensives were moved up by motor. One has only to read the books written by the various chiefs-of-staff that are now being published to realize not only that the supply system was dependent on the motor vehicles, but that without the motor it would have been flatly impossible to rush up and concentrate silently within a few days the troops necessary for any great attack. With the armistice the motors of all kinds used in the army began to come gradually into civilian usé. Then in October, 1919, came the great railway strike and the country seemed face to face with imminent danger of starvation. Strange to say, when the strike was over, the supplies of foodstuffs in the hands of the retail traders were larger than they had been when the strike began. (There was the single exception of sugar, which is hard to handle.) The motor vehicle had saved the country. Not less than twenty-five thousand motor vehicles of all kinds had been employed in the work of distribution, which consisted in conveying goods by motor transport to a number of principal centers and from them to all the adjoining places by subsidiary motor services.

It was realized now that a new force had arisen—a new ally for commerce, a new competitor for the railways. It is not realized less today when railway fares and freights are much higher than they were a year ago. As soon as the strike was over the chambers of commerce throughout the country petitioned the government that something should be done to maintain for the use of the state the motor services which had already saved the country from disaster. For a time the government directed that the surplus motor lorries used during the strike should be employed to relieve the congestion of goods at the docks and on the railways, but when that was done motor transport became once more a matter for private enterprise. The automobile association has just put forward an ambitious scheme for organizing the commercial motor transport of the country. The idea of the scheme is to organize the collection of goods to be carried by motor lorry and to prevent lorries returning empty, as our railway wagons so often do, on the return half of their journey. The association has between five hundred and six hundred agents who in their various areas will register the requirements and the offers of merchants and manufacturers and will fill up the cargoes of the motor lorries traveling to and fro. "There is thus in being," says a report on the scheme, "a system of clearing houses covering an area between Wick in the north of Scotland and Penzance and Dover in the south. A plan for eliminating dead mileage, that is to say, mileage run without a load, may be illustrated in this way. A Manchester haulage undertaker who may be conveying goods to Burnley will send to the clearing house agent at Burnley a form indicating the type and carrying capacity of the vehicle he is sending and the kind of goods he is prepared to carry. The Burnley agent will thereupon notify him as quickly as possible as to the consignments which he has registered and which may be suitable for his vehicle on the return journey." The railways, of course, are likely to continue to enjoy at present their advantage in pulling a very heavy load over a long distance, but for the shorter distances and for the convenience and expeditiousness of direct transport, the motor vehicle, there is no doubt, has an increasing pull on the favors of the industrial world.

But a new weapon like this brings new problems with it and some of them are difficult. Roughly speaking, there has been no great expansion or development in the road system of England for the last seventy or eighty years, that is to say, during the life of the railway system. When the railways came in, the road went out. An astonished world, unable to foresee the time when vehicles mechanically propelled and shod with rubber and steel would run on roads, believed that the railways were the final word of efficiency and that the roads so freely used before could be neglected. We shall have to pay heavily now for the mistakes of our forefathers. There is an enormous wear and tear on our main roads. Motor traffic, and heavy traffic too, is spilling over on the side roads of the country and wearing them to pieces, to the distress of the local authorities and to the dismay of the inhabitants who have to pay the piper. Many of our towns, small and great, are now the arteries through which flows an immense stream of traffic. But nevertheless they are not equipped with the broad trunk roads and exits which they need to carry the motor stream. Elsewhere, all over the country, there are complaints of the roads which are too light or too narrow for the heavy and broad vehicles that use them and there are demands that the roads should be widened or the vehicles diminished in breadth or certain roads barred altogether to motor traffic. It is estimated that, even as things are, £40,000,000 a year is being spent upon our roads. It is estimated also that at the present moment from 40 to 50 million pounds could be profitably expended, without regard to annual upkeep. For the purposes of maintenance the new motor taxes will provide almost nine millions a year, which is a good round sum, but no one suggests that it is as much as we shall need, especially now that the ministry of transport is completing its survey of all the roads of the country, which is to show us both what ought to be done now and what lines the road system of the future ought to follow.

One word about taxation. The new taxes bear severely upon one class of motor user who is at least as deserving as any other. No one has complained much of the new taxation on commercial vehicles or motor buses, but the ordinary motor car is to be taxed £1 per horse power and this will prove a specially severe burden to the owner of the light popular car who, of all the motor users, puts his machine to the most profitable use. Still, there are anomalies of every kind in our taxation today and where there is an absolute necessity to raise so many hundred million pounds there will be hard cases everywhere. The one moral which emerges from all recent experience is the increasing value, to the individual and to the community, of the motor vehicle, and we, therefore, who are free traders think it reasonable to ask that everything be done in this country to make free and open the importation of the motor car of every sort, so that a new instrument of progress may be placed as generously as is possible at the disposal of the people.

Your Own United States

The mornings often roll tossing seas of mist into the valleys, from which emerge at intervals craggy tops, glistening glaciers, and far-distant mountain peaks. This photograph was taken from a height at Indian Henry's. Mount St. Helens is lost in the mists forty miles away.

He Gave Up a Fortune to Save an Industry

Dr. Stephen M. Babcock Invented Milk-Testing Machines Now Used the World Over

By FRED L. HOLMES

STANDING on a pedestal in a room of the dairy school building at the University of Wisconsin is a device that has done more to promote the dairy industry in the world than any other single invention. It is the Babcock milk test invented in 1890 and "given free to the world."

Close by is the new agricultural chemistry building. From it any morning about 11:30 o'clock one may see a tall, gray-haired man, slightly stooped, wearing a soft wool cap, leave the building and enter one of the by-streets toward his modest cottage home. He goes early for lunch to avoid the crowds at noonday and shambles along at a gait that is said to have been characteristic of Lincoln. This is Dr. Stephen Moulton Babcock, the inventor. He is the most unpretentious person on the faculty—yet the one who is most world renowned.

The old philosopher who declared that "necessity is the mother of invention" stated a truism that finds demonstration in every decade. Inventions revolutionize industry and change the plodding history of nations. The cotton gin of Eli Whitney was an economic factor in the bringing of the Civil War. It gave an impetus to cotton culture that made the expansion of slavery in the southern states inevitable. The twine binder made possible the harvesting of boundless acres which geography maps of the great Northwest three-quarters of a century ago marked as "The Great American Desert."

"Co-operative dairying, stimulated by the invention of the centrifugal cream separator, needed a method of precision like the Babcock test to measure milk value," said Dean H. L. Russell, head of the Wisconsin College of Agriculture in discussing the influence of this invention on the wonderful advance in dairying. "If Dr. Babcock had not succeeded when he did in producing the simplest and most effective test, some other name would have been associated with the test, for under the stress of economic pressure it had to come."

What does the invention do to advance the dairy industry? The Babcock milk tester reveals the amount of butter fat in milk. It makes it possible to determine whether all of the cream has been removed from the skimmed product. Waste is eliminated. More important, it provides a simple method whereby the farmer may test the production of each cow in his herd and determine whether the animal is a "boarder" or a "money maker."

Millions of dollars have been saved in products formerly wasted to the farmers and the commercial world by the invention. The development of the dairy industry throughout the United States has been placed on a plane where cost of milk production can now be as accurately determined as a manufacturer is able by shop accounting to arrive at the cost of a finished product. Strong, productive herds are the result.

"The cow, from an economic viewpoint," continues Dr. Russell, "is simply a manufacturing plant through which is run so much raw material in the form of nutrients to turn out the finished products, milk and cream. Many of these manufacturing plants are run at a dead loss, but their owners do not know it, as they are too indifferent to take the trouble to keep books so that they can find it out. This is one of the lamentable defects in farming as a manufacturing enterprise. In any other phase of industrial activity, such negligence of business methods would spell bankruptcy. The Babcock test and a pair of scales make it possible for every farmer to keep accurate accounts with each cow in his herd, and where this is done it does not take long to convince the owner that the cow that does not pay her board had better move on. He learns that it pays to farm by scientific rather than by rule of thumb methods."

With the introduction of the centrifugal cream separator in 1885 butter-making gradually shifted from the farm dairy to the commercial creamery. There was, however, no method of determining the richness of milk and each patron was paid by the "pooling" system, on the basis of volume of milk sold, and this regardless of whether it had a high or low degree of butter fat.

"Moreover, no encouragement was afforded the progressive dairyman to deliver pure fresh milk containing a high percentage of butter fat," says H. W. Potts, of the Hawkesbury Agricultural College. "He received the same price for his milk averaging 4 per cent butter fat as the non-progressive supplier whose milk contained only 3.4 per cent fat. In those days it was not an uncommon sight to see leeches and young frogs in the sieves of the receiving tanks at the separating stations or factories—dumb evidence of the nature of the adulteration."

There was chance for fraud. Farmers with good herds were dissatisfied. Creameries that did not prosper suspected the farmers. The incipient dairy industry was endangered. Dean W. A. Henry was head of the college of agriculture at the time. He had attended a farmers' convention at Belvidere, Illinois, at which the dairymen declared that some method must be devised for testing milk, or there would be no growth to the industry. Dr. S. M. Babcock, university chemist, was consulted. It is easy to talk about such things, he replied, but scientists have been working for such a discovery for years, but an attempt by him could do no harm.

The pathway of discovery is crowded with many pitfalls and discouragements. For months in his laboratory, Dr. Babcock labored. Time and again when the way seemed clear to definite results, some unforeseen obstacle arose which delayed and baffled. Days turned into months and still no discovery. Finally a little odd-looking machine was constructed into which graduated test tube bottles of milk were placed and a drop of acid added. These when whirled at a certain speed separated the cream from the milk. Here was the discovery at last. But it still required months of practical tests to verify the results. Trial after trial was necessary to make certain that the apparatus would respond accurately under each and all circumstances. The machine was so simple that it seemed almost impossible to believe that the demand of the farmer and commercial milk buyer had been answered.

DR. STEPHEN M. BABCOCK INSPECTING A HOLSTEIN COW

Before his invention of the milk tester, the only method of telling the standard of a cow was through the amount of butter churned from the milk. The Babcock test, which was given free to the world, places the dairy industry on a scientific basis.

Finally the results were given to the world in a state bulletin issued in 1890. The last line in the published report read: "The test is not patented."

With that sentence a fortune was thrust aside. What a competence Dr. Babcock might have reaped from a patent may be realized when it is known that the Babcock tester is found in every factory and on most farms where modern dairying is practiced today; not in the United States alone, but in England, Germany, Denmark, Finland, Russia and Argentina, as well as Australia and New Zealand.

Following the discovery began the work of agricultural colleges and dairy associations in educating the farmers to use the device. It was taken to farm institutes where it was demonstrated with the greatest interest. Dairy schools came into existence in every state to train men in lines of cream factory and scientific dairy operation. Soon the invention found its way into the rural schools. In many a farm community today it is difficult to find a child over 10 years of age who cannot tell what the variation of one-half per cent in the milk test will have on the size of the farm's monthly milk check.

The Babcock milk tester is the pedestal upon which modern dairy education is founded.

The world is slow in showing gratitude to its benefactors—nine years after the invention, the Wisconsin legislature signally honored Dr. Babcock by conferring upon him the largest bronze medal ever struck in England. It was presented to him at the bar of the legislature in 1901. The medal bears the following inscription:

> "Recognizing the great value to the people of the state and to the whole world of the inventions and discoveries of Stephen Moulton Babcock, of the University of Wisconsin, and his unselfish dedication of these inventions to the public service, the State of Wisconsin presents to Professor Babcock this medal."

Other honors now came. In 1901 the dairymen of New South Wales, Victoria and New Zealand sent him an oil painting representing an Australian dairy scene. He was given the grand prize at the Paris exposition in 1900, and in 1901 the grand prize at the St. Louis exposition.

Because of the historic importance of this invention to the world the story of the invention was recently filmed, while all the persons interested in the discovery were still living. Again Dr. Babcock had his way. At no time is a charge to be made for showing this film, which remains the property of the state as a living picture of historic interest. There are three actors in the film—Ex-Dean W. A. Henry, who was head of the agricultural college when the test was invented; Dr. S. M. Babcock, the inventor, and President T. C. Chamberlin, who was head of the university when the discovery was made.

Offers of higher salaries do not attract Dr. Babcock. A commercial firm offered him a salary ten times as large as he was receiving, but he turned it down.

"I am working on a couple of unfinished experiments and cannot accept the position," was the burden of the reply.

A busy life has been spent by Dr. Babcock in laboratory investigation. He was born in New York and educated in Tufts College. For a time he was an instructor at Cornell, but in 1887 joined the staff of the University of Wisconsin. Age has not dimmed his youthful ardor for scientific investigation. Retired as an emeritus professor in 1913, he has continued his work as actively as before.

Even though he is past seventy-seven years, the laboratory, with its countless ill smelling acids, its big glass casks of crystalline distilled water, its flickering gaslights and powerful microscopes, is his greatest enjoyment. Here he works from morning until night, ever pursuing the wonders and mysteries of nature. Reluctantly he breaks the monotony with an occasional lecture to a university class.

"What makes you and me, the plants and the trees, grow?" seems an absurd question to ask here. A statement by Dean H. L. Russell announced in an obscure bulletin recently indicates Dr. Babcock is traveling fast after this secret "in both animal and plant life."

"Dr. Babcock has been carrying on studies in this subject for several years," says Dean Russell.

"He has discovered important relations existing between the presence of such water in plant and animal tissues and respiratory processes of living cells," continues the dean. "The formation of this internal water changes the cell contents, disturbing the equilibrium of the cell, and causing a movement of food materials toward the cells. This process continues as long as proper nutriments are available to supply the waste caused by respiration.

"It has been shown that the action of the 'metabolic' water plays an important part in the germination of seeds. It is also the chief source of succulence of ripened fruits. It seems quite probable, also, that the increase in water content and the development of sap pressure during the resting period of deciduous trees, as well as the early growth of buds in the spring, is due in large measure to this cause.

"Observations made upon various insects, such as clothes moths and grain weevils, which subsist entirely upon air-dried materials containing less than ten per cent of water, indicate the presence of over fifty per cent of water in the tissues of such insects, which difference can seemingly be accounted for only on the supposition that this 'metabolic' water aids in the development."

Dr. Babcock is still hoping to wrest some new scientific fact of world importance from the heart of nature.

Haskell Institute—The Indians' University

By E. B. CHAPMAN

THIRTY years ago the "ghost" dances had been held in the Dakotas. The tom-toms had been beaten; the medicine had been made. The time for the Messiah to come was at hand. He was to appear, drive the white man from the land and restore it to the Indians. Chief Big Foot's braves were preparing for the uprising that was doomed to end in Wounded Knee, Mission and other battles, described usually as "the War of the Messiah."

Sitting Bull and others had aided Big Foot all through the summer in inciting members of sixteen tribes to take the warpath.

Various stories were told of how the Messiah was to appear. One version was that he would appear as a buffalo, but still would be a man. He would separate the whites and Indians. The whites would be placed in front of this combination deity, man and animal, and the Indians behind.

At a given signal the earth would open just in front of the Messiah and roll back, burying the whites and leaving the nation for the red men.

Of course the Indians would have to fight. The Great Spirit could not be expected to aid a people whose warriors were unworthy. But as a token of the help of the spirit there was the invisible shirt which the medicine men had been inspired to prepare. Made of war paint and other ingredients it was to render the wearer impervious to bullets. Sitting Bull himself had seen, even talked with the Messiah. A star guided the great warrior to the place he had seen the coming spirit. With such an ally the efforts of the Indians could not fail. The hunting grounds of the fathers were to be restored.

Of course the plan brought only slaughter. Far from destroying the whites, it ended forever serious Indian uprisings. Never again was the red man to make a pretentious effort to regain what he had lost to the whites. Sitting Bull was slain. Big Foot perished at Wounded Knee where braves, squaws and children fell before the volleys of the soldiers. The invisible shirt proved useless. The chiefs were killed and the Messiah apparently had deserted his followers. There is more than one side to the story back of the Dakota uprising. There are the reports of starvation among the Indians and the broken promises that make the records of government dealings with the Indians something in which Americans take little pride. The appropriation to provide food and clothing for one band of Indians to withstand the rigors of a Dakota winter with its months of ice and blizzards, from fall until spring, was one cent a day per Indian. There were pleas for help that went unheeded until army heads, charged with keeping the Indians from the warpath, interfered.

Long before the ill advised uprising, however, a new plan of dealing with what then was a serious problem had been launched. It had occurred to some one that a better, cheaper plan than killing Indians would be to make them useful members of society. Schools had been opened for Indians in various sections, particularly the Middle West. But as long as there was hope of throwing off the yoke of the white man the Indians scorned to embrace his culture. In many cases it was difficult to obtain pupils enough to fill the schools. As one educator expressed it, "if the reservation agent and the prospective pupils were willing the parents objected; if the parents and children were willing the agent would not consent."

With the final crushing of Indian efforts to regain their lost possessions by war, accomplished virtually when that ravine at Wounded Knee was filled with dead and wounded Indian men, women and children, came a quickening of interest in the schools. Indian education flourished in the nineties.

A few years before the last uprising worthy of the name was being plotted a young teacher entered the government service at Haskell Institute, Lawrence, Kansas, who was destined to have an unusual influence in the lives of thousands of Indians. There was little to indicate it at that time. His classes were the first and second grades. The pupils were from 18 to 40 years old. All looked alike to the young teacher, acted alike, seemed slow to learn, stolid and uncommunicative. A homesick Cheyenne pupil would steal out of the dormitory each evening and play weird Indian airs on an Indian flute. The new teacher said later he never had forgotten the lonely moments the music inspired.

A few days in the schoolroom, however, and the new teacher began to note individuality in his pupils. Their tones of speech, ambitions, capacity for study and dispositions varied like that of other pupils he had taught, but these things had not appeared on the surface. The pupils began to interest the new teacher. That interest has been growing for 34 years. The young teacher, H. B. Peairs, superintendent of Haskell now, almost built the school. Becoming superintendent in 1898 he saw the institute change from a small school difficult to fill with students to the institution it is today where almost every trade is taught, where pupils are taken through ten grades of school work, where virtually all the stenographers, bookkeepers and clerks in the service are trained; a place with 50 buildings, a staff of 75 instructors and employes and known in every state in which there are Indians. Sixty-four tribes are represented in the school this year.

In 1910 came promotion. Mr. Peairs was made general supervisor over all the schools in the Indian service. It was an opportunity for further observation of the Indians, a broader study of their needs and a more general service to them. But after seven years, in which time he was traveling from tribe to tribe and school to school, he returned to Haskell. His first year back at the old school saw the biggest enrollment in its history. Eleven hundred pupils attended.

Today he knows hundreds of Indians personally. Some of his pupils are grandparents. More than 100

Above: Students at work in garden at Haskell Institute.
Below: H. B. PEAIRS, superintendent of the school.

students enrolled in Haskell today are sons and daughters of his former students. A man with thinning hair, bronzed and weather-beaten, entered the school office a few weeks ago. Mr. Peairs welcomed him as a former pupil. The man explained he had attended the school in the late eighties and wished to enroll his son.

Under Mr. Peairs and others at Haskell, Indian education ever has been along practical lines. A few weeks ago one of the big newspapers of the Middle West featured on its front page the announcement that the board of education would provide courses in practical housekeeping at the schools for Negroes. Indian girls have been receiving such instruction at Haskell almost since the founding of the school in the middle eighties. Long ago it was realized that if Indian homes were to be made brighter and living conditions better the mothers must be made better wives, mothers and housekeepers. The girls are taught not only the preparation of food but the food value of the articles prepared. They are taught not only to keep house correctly but to make virtually every garment they wear. Half a day is spent in the schoolrooms, studying books; the other half is devoted to the practical work of the home.

Boys and young men also spend half a day in the schoolrooms. The other half is spent at the trades, the dairy barn, with the stock-growing teachers or on the 1,000-acre farm where agriculture has been taught since the inception of the school. Yet it was comparatively recently that the nation was awakened to the value of vocational training in the public schools.

In late years pupils in the public schools have been impressed with the importance of the frequent bath, the gospel of the toothbrush and the golden texts of sanitary surroundings. These things were being taught Indians at Haskell a quarter of a century ago.

And what has been the result of this education?

One result has been the elimination in the Middle West of that never failing topic of discussion in the nineties, "The Indian Problem." In the extreme West there still is such a problem. It is due to lack of schools there offering the advantages Haskell offers. But there is no Indian problem in the Middle West except to fill the smaller schools. In thousands of cases the Indian children attend the public schools. Some go to church schools for their work up to the fourth grade, then to Haskell. The Indian youth has become discerning. If he is going to spend time in school he wishes something practical for a subject of study and he has a more varied list to choose from at the Kansas institution which is the government's largest Indian training school. Where the Indian department has seen fit to abolish the reservations, the Indians have been absorbed by society and are filling their places as its members. Stay all night at the best house in a large number of Middle West villages and towns and the chances are you have been a guest in an Indian's home.

Where there are reservations, fine homes and cultivated fields have replaced the tepee and the hunting grounds of 40 years ago. And the leading men of these communities almost always are former Indian school students, a surprising number of them former Haskell students.

The results of years of teaching the rudiments of health and sanitation are shown by the Indian census which reveals the Indians, disappearing rapidly in the nineties, an increasing race.

Grandsons of the men who fought the white man's advance into the country west of the Mississippi instead of planning raids on settlements, the taking of scalps and lives spent in hunting and fishing now look forward to being mechanics, farmers, bookkeepers, stenographers.

Only a small per cent of Haskell students graduate. A year or two in the school fits the pupil for work at which he can earn good wages and he quickly foregoes further training in the school shops for work at the trade he has been learning. Boys with a year or two in the paint shop, the garage, the print shop, the blacksmith shop, the tailor shop, the carpenter shop and the wagon shop can earn good wages while completing their apprenticeship. They go from school into industry and generally make good at their chosen work, so the object of the school training has been attained and the place is left open to another Indian without the rudiments of a trade.

A few months ago Mr. Peairs wished to know something more definite about the work of Haskell graduates. A questionnaire was prepared including these subjects:

What number are self-supporting?

By what activities are they self-supporting?

What is their standing in the community in which they live—good, fair or poor?

How many of each?

How many are regarded as successful? As total failures?

How many have received no benefit from their training?

Of the less than 400 graduates concerning whom the questions were asked and the records checked, virtually all were self-supporting except in cases of physical disability. Reports showed 345 were considered successful and only three as total failures. All, with the exception of four graduates, had a good or fair standing in their own communities. Of that number all but 33 were scored as good, the standing of only four being poor.

There is a wide range of activities listed by the self-supporting graduates. It includes farming and clerical work as the favorites. Then come bank cashiers, salesmen, ministers, railroad men, motor car mechanics, postmasters, school disciplinarians, chicken raisers, bookkeepers, real estate and loan men, inter-

preters, milliners, telephone operators, construction supervisors, editors and owners of newspapers, abstract men, sales managers, millers, nurses, band directors, teachers, including principals of schools, draftsmen, engineers, plumbers, electricians, matrons, tailors, printers, painters, fruit growers, stockmen, postal clerks, bakers, music teachers, merchants, carpenters, laundresses, shoe and harness makers, soldiers, sailors, foundry workers, blacksmiths, insurance solicitors and superintendents of Indian schools.

A group of thirty graduates earning the largest salaries showed combined yearly salaries amounting to $67,170. The highest salary paid a graduate is $7,500. It is received by the sales manager of a milling company. Another, an oil company employe, receives $5,700. The principal of a school in the South receives $4,000. Only 66 students gave the salary received. Those salaries amount to $101,402.

Not large as large salaries go? No. But it should be remembered that these graduates are the first generation since the War of the Messiah. The fathers of these graduates, for the most part, were regarded as savages.

The majority of Indians, not being citizens and being barred from citizenship by law, were not subject to the draft in the war. Yet records show more than 8,000 Indians were in the army and navy. Of that number more than 6,500 volunteered. Indians bought more than 15 million dollars in Liberty bonds, according to a report of the Secretary of the Interior and the women (daughters in hundreds of cases of the squaws charged 30 years ago with mutilating the bodies of slain soldiers) did a vast amount of Red Cross work. The records show 450 former Haskell students served in the army, navy and marines. Is it not significant that agents of the kaiser, charged with inciting Negroes to revolt, promising Mexico part of the United States in return for a war against this country, and on the lookout for agencies through which trouble might be stirred up in the nation to weaken it in the war, nowhere are charged with having been given even a hearing by this race, which in Europe, would have been regarded as a conquered people?

"I believe, as a result of the war, when the flower of the Indian manhood marched shoulder to shoulder and fought side by side with the other races that make up the nation, Congress soon will provide for the greatest event in Indian history," Mr. Peairs says. "I believe every Indian soon will be given full citizenship. Citizenship long has been the right of the Indian, in my judgment, but has been denied him. Because of the showing made I think it soon will be bestowed."

Steps already have been taken to grant citizenship to those who served in the war and to all except full-blooded Indians.

Mr. Peairs pointed out as a danger to Indian education the offering of big wages as the result of the labor shortage. It would take young Indians from school just at the time the training would be most valuable, he said.

A follow-up system of keeping in touch with former graduates now has been adopted at Haskell. Twice each year letters are sent to the address of every known graduate. The system is not complete because fires have destroyed all records at the school. But the list is becoming more complete each month. The idea is that by keeping in touch with the former students the educators may be of more service to their charges.

"We believe that in this way we can help the former student solve problems that will insure against his lapsing again into the old tribal life of uselessness," Mr. Peairs said and told the story of two boys, Navajos, who, denied by their parents the privilege of returning to Haskell after a year in the school, ran away from the reservation to continue their training.

There still are many tragedies in Indian homes because of the white man's education. In many Indian settlements in the West, families all sit upon the floor, eating from a cloth spread upon it. Children from such families are sent to schools, learn the ways of civilization and, going home, cannot bring themselves to live like their parents. In some cases these children are not allowed to leave the reservation because of the rulings of Indian agents. But they cannot live under the conditions at home and the old Indians refuse to change. There is nothing left the student but to return to the old life or leave home. And neither choice is pleasant, altogether.

And yet, the system which has made possible these improvements in the race is responsible for the most difficult "hurdle" the Indian student has to take. Generally the Indian student is not self-dependent. The government always has furnished what the Indian had, whether it was good or bad, sufficient or insufficient. He has come to wait for the government to provide. That only is to be expected because of the paternalistic attitude of the government for a century, educators say, but every effort to combat it is made and the results are beginning to be seen.

Problems in the training of the Indians vary with the locality. The most difficult problem in training Indians from the oil sections of Oklahoma is to get them to work.

"We came to school," the youths and young women whose oil incomes amount to hundreds of dollars a month, in some cases, explain. "If we wish to work we'll get out and go to work."

More Indians take up trades than farming. Add stock growing to straight farming and it carries a great appeal. But the lure of the city is strong upon the Indian as well as the white youth. The trades appeal more than agricultural pursuits, stock growing and dairying. Indians prefer boulevards to dirt roads, the crowded streets to the quiet of farm life.

But Indians of today have learned that their fathers went about it in the wrong way when they sought to recover the land lost to the white men. They are learning rapidly that they must excel the white man at his own culture if they wish to beat him; that the way to regain the land is to get the white man's money through industry or business and buy the land from him; that one must make it produce more and better crops and that the white man's mode of life means more comfort and greater joys than existed in the good old days when Indians died by the thousands in an effort to restore.

AN INDIAN CLASS IN TOUCH TYPEWRITING.

Why and Because

Why does a dog turn around several times before lying down?

Because in his wild state, the dog lived in jungles, as the wolf and fox do now. Before lying down he turned several times in order to tramp the leaves and grasses down and away from his body and thus secure a flat resting place. The instinct still survives though there is no reason for the practice.

Why is 13 called a baker's dozen?

Because in olden times a baker who gave short weight was subjected to severe penalties, and to be on the safe side he always added an extra roll to the dozen to make up for any possible deficiency in the others, and thus safeguarded himself.

Why does a woman "give the mitten" to a man when she refuses him?

Because when women wore half gloves, or mitts, they could withdraw the hand from the grasp of a lover and leave only the glove therein. In this way the unwelcome suitor was made to understand that his attentions were not wanted.

Why are elephants afraid of mice?

Because mice strongly resemble a little animal known as the chacana, which feeds on a small berry especially liked by the elephant. Chacanas live in the ground after the manner of prairie dogs, under the bushes, and are often trampled upon by elephants. In their fright the little animals run up the tubes of the elephant's trunk, their long, sharp claws catch in the flesh, and they cannot be ejected. An agonizing death is almost invariably the consequence to the elephant.

Why is the first period of married life known as "the honeymoon"?

Because of an ancient custom in the northern nations of Europe. The bride and bridegroom, for a month after the wedding, drank a wine made from honey as their principal form of nourishment. It was called the honey-month or moon.

Why was the sandwich so called?

Because the Earl of Sandwich (1718-1792) on one occasion, not wishing to leave his place at the gaming table, called a waiter and ordered some slices of bread with ham between them to be brought to him, so that he could go on playing without interruption. To this combination his friends gave his name.

Why is noon the traditional and fashionable hour for wedding ceremonies?

Because the hour became the customary one in England many years since, for the reason that the bridegroom could not be relied upon to be sober any later in the day than twelve o'clock. It was naturally desirable that he should be responsible for his promises, and unless he was in a state of perfect sobriety this could not be. Hence the precaution of a noonday wedding.

Why do the stars twinkle?

Because their light passes through variously heated and moving currents of air which act as a refractor. Much twinkling foretells bad weather, because it denotes that these aerial currents are more disturbed than usual.

Why are sailor's trousers always made wide at the bottom?

Because, in the course of ordinary small boat duty, a sailor generally goes barefooted, and in making a landing on a beach he grasps his trousers and pulls them up to the thigh, thus landing through the surf with dry clothing. Another reason is that with wide trousers at the bottom a sailor can easily kick them off in case he falls overboard, or is obliged to go overboard in a great hurry.

Professor Forecasts Weather Fifteen Months in Advance

DO YOU wish to know the amount of rainfall there will be next summer and the months in which most of it will come?

Get the government records for the locality and turn to 1916. The chances are, 21 out of 26, the rain and its distribution will be the same as in 1916, according to computations of Dinsmore Alter, Ph.D., professor of astronomy at the University of Kansas, at Lawrence.

In support of that statement are records showing that weather repeats itself every five years, as regards rain.

That, however, is not the only discovery Professor Alter believes he has made. There is also the relationship of rainfall, earthquakes and sun spots. It was his study of earthquake and sun spot records that led to his conclusion there was such a thing as a cycle of rainfall.

Alter's search of information regarding earth shocks led to his consulting Chinese records, said to date back to before the birth of Christ. The records indicated, the professor says, that the tremors are most frequent at periods separated by fifteen months.

The data compiled in searching the Chinese records were checked against sun spot records kept in Germany since about the time of the signing of the American Declaration of Independence. Thus it was learned that earth shocks were most frequent when sun spots were at a minimum.

Then the dates when sun spots were at a minimum and earthquakes at a maximum were compared with the records of the United States Weather Bureau. That investigation, Professor Alter says, showed that 21 times out of 26 the earthquake maximum, the sun spot minimum and the heaviest rainfall came together.

Thus, the professor believes, he has established definitely a 15-month cycle of rainfall. At that rate earthquake and rainfall conditions would repeat themselves every five years.

The first rainfall records investigated by Professor Alter were those of the corn growing states of the West. The weather bureau records at Lawrence are the oldest in Kansas. It is interesting to note, in connection with the reported discoveries believed to have been made, that bumper crops of corn were grown in states east of Central Kansas in 1920, 1915, 1910 and 1905. That was because the rains came late in the summer in those years, at the time when it was needed most by the corn.

The abnormally dry weather over the eastern half of the United States last winter and the heavy rains in August fit nicely into the new system of weather forecasting. Weather bureau reports show that half a million acres of corn in Iowa were beaten down by the late rains. Five years ago thousands of wheat fields in the Central West went uncut because the wet weather prevented the harvest.

It is not claimed for the new theory that it is infallible. Occasionally in the scheduled dry part of the cycle comes an exceedingly wet month. A month without rainfall sometimes appears in the wet part of the cycle. But the daily weather forecast of the government, representing the furthest advance in that line known to the world, is correct only 85 per cent of the time, according to bureau officials.

Professor Alter has no plan to exploit what he declares is his discovery. His ambition has been to have the announcement of his work made by a scientific magazine of high standing. He refuses to talk about that, but it is understood he is to realize that ambition soon.

PROFESSOR DINSMORE ALTER

Quiet, conservative, young to be the discoverer of a method of forecasting the weather a season ahead, the professor is said to be one of the most approachable men at the university. He is active in American Legion circles, belongs to the Lawrence Chamber of Commerce and is extremely reticent about publicity. In that respect he is in wide contrast to the old-time "rainmaker" and the professional long-distance forecaster.

He does not claim perfection for his theory but believes sincerely, as do scientists at the university with whom he has talked of his discoveries, that he has arrived at the "farthest north," so far, in predicting weather conditions fifteen months ahead.

Rediscovering the Elephant Seal

DURING the winter of 1911, the United States Government sent out an expedition to make deep-sea investigations. When the expedition reached Guadeloupe Island, on the coast of Lower California, the man in charge decided to go ashore, and to his delight, they found on a strip of sandy beach not more than three hundred feet long, and flanked by high, impassable cliffs, a herd of more than one hundred northern elephant seals sunning themselves. As the naturalists had believed that the northern elephant seals had become extinct, the discovery of such a large herd was of great importance. There is deep water all about the island, and the ship was anchored as near the shore as possible, so that the men could study the animals freely. Six small seals, about a year old, were captured alive and taken on board the ship. These were for study and exhibition purposes. The expedition spent two or three days in studying and photographing the animals in their native haunts.

The elephant seal is so called because of its great size, and because of its nose, which is very long—sometimes eighteen inches from its tip to the eye—and shaped like an elephant's trunk.

The animals average about fifteen feet long, and ten or eleven feet in girth. Some of the males are longer than that, one animal being recorded as actually measuring twenty-two feet. The newly-born seals, or pups, are about four feet long, and generally very fat. These are black in color, while the adult seals are a yellowish brown. The skin is very thick.

Unless they were actually teased, the seals did not pay any attention to the men, some of them did not even raise their heads. If they were driven to move they would settle down again, first covering their backs with sand, which they threw up with their front flappers. When those that went into the ocean returned, they got out of the water very slowly, spreading the flappers to get the benefit of each wave. When they are out of the water they crawl slowly, though they are able to crawl great distances. When crawling, they resemble huge inchworms, for they arch the body, drawing the hind quarters forward, and shifting the fore quarters with the front flappers braced outward.

These seals fight frequently. They crawl slowly within striking distance, and then, rising on their front flappers, draw back their big noses, open their mouths very wide, and strike at one another with their large teeth. Although they wound each other on the neck, they do not do any great harm, for the skin is very thick. The fighting is not of a desperate nature, and does not last long.

Although much has been discovered about these rare animals, the scientists have never been able to find exactly what they eat. The captured elephant seals refused to eat for more than two weeks, but after they reached the aquarium in New York, they lived on fresh fish cut into moderate-sized pieces. It is supposed that the elephant seals live on live squid, and sardines.

The northern elephant seal has existed as a race under very hard conditions. Previous to 1865 the animal was killed in very great numbers for its oil.

As far as the United States Government expedition has been able to find out, this animal is found only on Guadeloupe Island. It is slowly increasing in numbers, and it is hoped that it will not be molested by hunters.

The island is not inhabited, and the Mexican Government, which owns the island, has not as yet interested itself in the protection of these animals. The United States Government, however, is working to see that some steps are taken toward saving the rediscovered northern seal.

Stories of Old Home Songs

By CARL SCHURZ LOWDEN

LET TYRANTS SHAKE THEIR IRON ROD

WILLIAM BILLINGS was, without a doubt, one of the quaintest figures in the history of American music. Born in Boston in 1746, he died there in 1800. As a young man he derived much amusement from the gentle occupation of writing down the music that surged within him. Before his time, the music used in the United States was brought from Europe. When war came, however, the people turned away from the English airs and sought the works of Billings.

"The American Revolution," Frederic Louis Ritter, in his "Music in America," declared, "caused the colonists to go against everything that was British. The innocent old psalm tunes received a part of the momentary patriotic hatred; and with the tea, the British tunes were also thrown overboard."

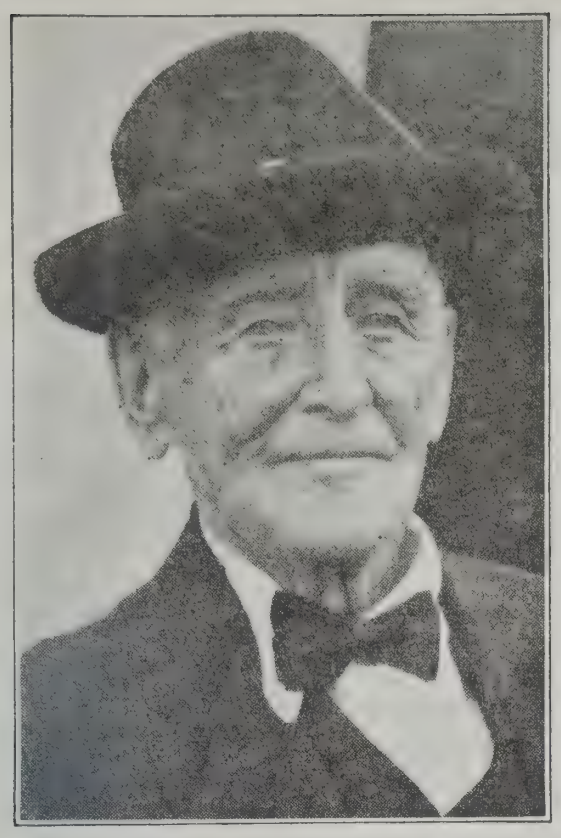
This rude, crude sort of a man was a diamond in the rough; today, of course, we would not consider him a diamond at all. He had music in his soul, and he hummed vagrant strains as he labored in a tannery. He sang and taught music; then he ventured to fashion complete hymns and martial bits for the colonial army. Critics have called him an awkward harmonist and a "worse contropuntist"; but, as Ritter pointed out, this man nevertheless had the "genius and zeal to write words and music that moved the hearts and nerved the arms to strike for freedom in those early days."

He has often been wrongly rated as the earliest, or first, native writer of music in America. This title undoubtedly belongs to Francis Hopkinson who composed "My Days Have Been So Wondrous Free" in 1759 when Billings was only thirteen years old. Hopkinson was born in Philadelphia in 1737. It is generally accepted, however, that Billings was the first American to produce a war song. "Yankee Doodle," the favorite war song of the Revolution, was the work of Dr. Richard Shuckburgh of the British Army; he wrote it to ridicule the shagginess of the colonial militia that assisted in the fighting against the French and Indians.

The songs of Billings were woefully lacking in correctness and finish, for he had received no education in music or literature. The people of his day accepted them eagerly and sang them likewise. He exhibited poetic fire and real patriotism, also some inventive ability. He wrote a song of five stanzas, set it to his own tune of "Chester," called it a battle hymn, and dedicated it to the army. One commentator has said that this song beginning with the line, "Let tyrants shake their iron rod," was played on every fife in New England. This statement seems a bit extravagant; yet when one considers the spirit of the soldiers that endured such privations as those at Valley Forge, it does not seem impossible.

"Billings paraphrased the psalms of David and brought them to date," a Chicago journalist has said. "Appreciating the religious fervor and the spirit of the day, he made them hymns of battle. The people, familiar with their Scriptures, firm in belief in the justice of their cause, found only natural an application to themselves of the old songs of bondage of the children of Israel."

Though described as a mixture of ludicrous, eccentric, commonplace, smart, honest, patriotic, and religious elements, Billings was the prophet that made of Boston a musical city. During his time, he did more for the musical advancement of New England than did any other man. He was a revolutionist, in several applications of the word. Into the church he introduced the violincello, also the pitch pipe for the singers. He is also said to have originated the concerts in New England.



His first publication in book form was "The New England Psalm-Singer." Eight years later, in 1778, he issued "The Singing Master's Assistant" which grew in popularity to such an extent that it became known as "Billings' Best." During the war of the Revolution he composed many patriotic songs and proved himself to be a man of remarkable energy.

"This zealous patriot," Colonel Nicholas Smith lamented a few years ago, "who was the first to teach the American people to sing anthems of praise and songs of victory, has no monument, not so much as a simple stone slab, to mark his resting place in a Boston graveyard."

This statement might be made about dozens of men who contributed more than their quota in the development and strengthening of the nation. The American people are too busy to honor some of the departed heroes and pioneers; this is a condition that may be profoundly regretted, but it can scarcely be overcome or righted while the chasing of the "Daddy Dollar" remains paramount, with the expression of gratitude entirely secondary.

Although William Billings has no monument of stone or marble, this pioneer Bostonian is not forgotten. He has monuments in the printed words of certain books; they are paragraphs that tell his rank in the general scheme of things.

"His compositions," says the American History and Encyclopedia of Music, "showed considerable musical genius, being much more pleasing in vigor and melody than the old English tunes then in use. His music became so popular that it was used by the churches almost exclusively. He may really be considered the founder of American church music."

"UNCLE" JOHN DAUBNEY,
101 years old, whose philosophy of living is to keep "movin'."

Past the Century Mark: Still Going Strong

METCHNIKOFF wrote long on how to live 100 years, and then died before he was seventy. "Uncle" John Daubney never thought much about how to live, but spent his time "workin' and livin'."

And on October 6, Uncle John celebrated his 101st birthday at his home in Taylors Falls, Minnesota, in the beautiful valley of the St. Croix, where he started logging in the wilderness 75 years ago.

"Yes, sir, I'm a hundred and one," Uncle John is saying with a chuckle these days, and in that chuckle there's more of the joy of attainment, more of the zest of living than money can buy or words describe.

Dean of all the pioneers in Minnesota, he's the last of the "Forty-Niners" and the only surviving member of the Old Settlers' Association.

"It's great to be alive," he was saying in that rich, mellow voice the other day as he walked up the streets of the quaint old town where he makes his home. "Livin', just livin' is fun."

He walked briskly, and without a cane, a ruddy complexion, gained from years out in the open forming an appropriate setting for the smile that flitted across his face. His mind was as active as when he first braved the Minnesota wilderness, and as he walked along the street, he talked of the things that had happened in this 101 years of life.

"How can you keep so well—what is the secret?" came the question.

"Keep movin'," Uncle John replied.

"If you think you can't do nothin', then you can't. If you lay down on your back, you can't do nothin'. That's why these fellers get old and die at 60. Why, they're just kids and ought to just be enjoyin' life.

"Why, I work every day. Maybe I dig two or three bushels of potatoes, or somethin' like that every day. Last summer I went out and pitched hay with a bunch of the young bucks. That was fun. I showed 'em I still can do it. An' I do just as well as they can; at least so't seemed to me.

"Workin' and keepin' active is everything. When I'm not workin', I'm movin' round, walkin'. If I quit bein' active-like, I'd drop off like the rest of 'em.

"Yes, I'm a hundred and one, they do say, an' it's written in the family Bible. But, by golly, I can't seem to realize it."

He stopped to laugh.

"I used to think thirty years ago I could do as much as any of 'em," he went on. "When I was seventy, me and another young feller walked five miles an hour for ten hours. He was pretty good. He kept right along with me.

"I guess I couldn't walk 50 miles a day now. Still I don't know. I could go twenty today all right."

Uncle John underwent an operation a month ago for the removal of a growth on his forehead. He was given ether and the operation was performed one morning. That afternoon he was up walking around as if nothing had happened.

Before the week was over he had taken an eight-mile hike to another town.

" 'Nother thing," said Uncle John. "No use worryin' about things. The elephant's stepped on me pretty hard some times.

"But them's the ups and downs of life, as Maloney used to say. 'Yesterday I dined with the governor,' Maloney would tell me, 'and today I am drunk with Tom Flynn.' "

His sides shook with laughter as he recalled the incident.

That laugh of Uncle John's is very much a part of his philosophy of "livin'. "

"Yes, sir, the elephant's stepped on me, and no mistake," he went on. "Sometimes there weren't no water to get the logs down, and them was rough times. Four winters I slept outdoors. No hotels, no nothin'. I 'member once I'd a froze if I hadn't a walked all night. I had four pair of heavy blankets, and when I camped I rolled up. Pretty soon, I felt like I was goin' to freeze. So I got up and broke a path in the snow—it was two feet deep—and walked all night.

"An' the Injuns were wild. They'd scalp you slicker'n kite in a minute if they took the notion.

"Now things are easy. We have everything. Trains go to Chicago in twelve hours—flyin' machines, roads and bridges. There's everything. Cities, wonderful, and all here where there wasn't anything, only trees and wilderness. Sometimes I feel like pinching myself to see if it's all real."

Then he stopped to reflect.

"Isn't this a beautiful place?" he asked, raising his arm to the hills of the St. Croix, resplendent in the multicolored garb of the autumn leaves.

"Now if these here people who lives in cities and just think of makin' money and livin' fast would get out here," he said, "they'd live longer. I've lived hereabouts in the trees for somethin' like 75 year, and I love 'em. You know, down here we got wells in the solid rock 40 feet deep. The water fallin' made 'em, I says, says I. Some others has explanations, but I say it's the water. Time does funny things."

Uncle John wore a beard until four years ago. The men at Taylors Falls got to joking him about getting old. So home he went and cut it off.

He reads the newspapers without glasses. He eats any food that others eat, and always sleeps soundly. He never complains and talks about himself only when questioned. In fact, his genial, good nature is the legend of Taylors Falls. He's never been sick, except once when he had a fever.

Twice a year, he goes to Decorah, Iowa, to visit a brother, Wilson Daubney, who is 98 years old.

A great oak that stood in his yard at Taylors Falls weathered the storms of the St. Croix Valley for decades, and then there came a day when its top broke in the wind, and the old tree died. And now the people of the town point out the stump of the tree and tell how Uncle John outlived the oak.

Scoring in a Score of Years

IN MARCH, 1900, summarily ordered by the president to leave the University of Kansas as an objectionable agitator representing an organization not permitted at the university, and warned never to return; in March, 1920, en route to Europe at the request of European leaders to present the viewpoint of American students on the liquor problem to European universities—this is the experience of Harry S. Warner, educational secretary of the Intercollegiate Prohibition Association.

In 1900, Kansas was legally dry, but prohibition was not established in the social consciousness of the state. Mr. Warner, then just out of college and on his first trip as traveling secretary for the Intercollegiate Prohibition Association, went to the University of Kansas to visit the student prohibition club. This organization, small and influential, was officially a Prohibition party organization, as indeed was the national I. P. A. at that time. One rule of the university provided that chapel announcements must be in the hands of the dean twenty-four hours in advance. Warner, ignorant of this rule, went to the chapel platform with a student and handed in an announcement of a meeting for that day. The announcement was not read. After chapel, Mr. Warner was summoned to the president's office and roundly scored for violating a rule of the university. He was further informed that neither he nor the I. P. A. were wanted at the university, and he was told never to return.

In the spring of 1920, Mr. Warner sailed from New York on an eight months' trip among the universities of Western Europe in response to repeated urgent invitations from university leaders there. He has visited practically all the universities of Great Britain, and the principal universities of France, Belgium, Switzerland, Holland, Denmark, and Sweden, and some of the leading institutions of Norway, Finland, Germany and Italy.

Harry S. Warner is known wherever the Intercollegiate Prohibition Association is known. Since Washington's Birthday, 1900, he has devoted his time and energy tirelessly to this organization. First as a traveling secretary, then for twenty years as general secretary, he has been the executive head of the movement. He has visited and spoken in 270 colleges and universities; for seventeen years he has been editor of the "Intercollegiate Statement"; he has edited five series of study topics on the liquor problem; he is the author of "Social Welfare and the Liquor Problem," which is ranked first among American publications by leading temperance workers; and all this time he has been secretary of the board of directors, and much of the time treasurer of the organization as well. Few men have done as much work as he, and done it as well for any organization.

Largely because of his power to inspire thinking college men, the organization has accomplished much. Knowledge, decision, action—this was the strategic method of approach.

An oratorical contest system produced 10,000 original orations for delivery before a total of 3,000,000 people. Emphasis on study courses induced 100 colleges and universities to present courses of study in their curricula, and 125 more to arrange volunteer study courses on the liquor problem. The facts of the problem were presented to 100,000 students annually by trained secretaries. Hundreds of lecture courses were conducted. Journalistic contests secured the publication of masses of original prohibition material. As many as 2,000 students served in local prohibition campaigns in a single year. Drinking customs in universities were investigated and fought. Hundreds of petitions and thousands of letters were sent to legislators. During the war the I. P. A. furnished the executive force to carry on the work of the United Committee on War Temperance Activities in the Army and Navy, through which twenty-two constituent organizations functioned in every camp and cantonment, both at home and abroad. And all this was done with almost incredible sacrifices on the part of college and university students, and because of the flaming purpose kindled by the efforts of this man.

Such a program played no small part in training the leadership which finally won the victory for the prohibition movement.

Students of other lands are eager to know about these accomplishments of the Intercollegiate Prohibition Association. They ask about the future plans of the organization, now that this nation is dry by Federal constitutional provision.

It is the message of the why and how of American prohibition, and the part that the students have played in this reform, that Mr. Warner has been telling to the university students of Western Europe in response to their requests. And everywhere he has told it—Oxford, Cambridge, University of London, University of Zurich, Heidelberg, Geneva, and the University of Lyons—there has been the keenest of interest manifested. More than that, he was one of the outstanding figures at Karlstad, Sweden, recently, when representatives from nine different countries met in an international student prohibition conference. The formation of a world student anti-alcohol organization is the probable outcome of this conference. In fact, a temporary organization has been formed preliminary to the calling of another international conference next year and completing such an organization; the name of this ad interim movement being the World Student Anti-Alcohol Federation. This body passed resolutions of strong protest against the invasion by foreign liquor interests of countries now engaged in a struggle against the liquor traffic, especially Norway and China.

Not only does the Intercollegiate Prohibition Association in its present world work have a chance to touch the students of other nations through the world federation mentioned, but here at home a most strategic opportunity presents itself—work among the foreign students.

Many of these men are already leaders at home and are here for a short time to increase their knowledge in their own specialties. To influence them is to influence the nations of the world. That the I. P. A. has seized this vital task is evidenced by the fact that through their inspiration there have been organized in the universities and colleges of America the Chinese Students' Prohibition League and the Latin League Against Alcoholism. Similar organizations among the students from other countries are in the process of forming. The Chinese students' organization alone has over 900 members, practically half of the entire number of Chinese students in America.

They also hold oratorical contests, investigate conditions relative to the effects of prohibition, and are introducing these facts into China.

Thus has Mr. Warner, through the Intercollegiate Prohibition Association, scored in thorough fashion in a score of years. It is always significant when college students come to grip with vital social problems. Hence, more scoring may be expected in the next score of years through the World Student Anti-Alcohol Federation.

Briefly Told

General Ludendorff, who commanded more than 7,000,000 men in the German Armies during the war, is now a "buck private" in the Bavarian home guard.

San Salvador, smallest of the Central American States, is preparing for an inrush of oil men owing to the discovery of petroleum near the eastern frontier.

The plan of a missionary to transplant a colony of Koreans to a tract of land in Alabama fell flat when the state commissioner of agriculture refused to welcome the scheme.

A great relief map of the world, showing all known physical conditions of the globe, is being prepared by the United States Shipping Board.

Premier Witos, of Poland, is a peasant who was put into the position as a figurehead when the Russian advance threatened Warsaw. He likes the job, however, and his shrewdness and keenness have caused the failure of several attempts to oust him.

General Pershing will be a member of the committee to celebrate the 100th anniversary of the death of Napoleon, May 5, 1921. Marshals Foch and Haig and General Diaz, of Italy, are the other members of the committee.

Texas has a new law aimed at preventing strikes in ports and railroad terminals and imposing heavy penalties for interference with workers during labor disturbances in these industries.

It is proposed that the commissioners of the District of Columbia be given permission to take part in congressional debates.

The 10 invaded and pillaged departments of France have produced this year 500,000 tons of wheat and one-fourth of the nation's oat crop.

More than 1,200 nuns in the Roman Catholic diocese of Newark, New Jersey, have registered to vote. They will cast the ballots under the names they bore before entering orders.

The battleships Iowa and Indiana, which cost millions of dollars to construct, are being used as targets for the big guns of the new fleet and the bombs of seaplanes.

Empowered to purchase $20,000,000 worth of electrical equipment for new plants at Melbourne, Australia, a commissioner from that commonwealth has arrived in San Francisco.

An explorer and wealthy clubman of London with 40 followers is embarking on a cruise in search of an island in the South Seas where taxation is unknown.

Indians of the sheep country in California are buying automobiles, silken hose and other expensive products.

Acting upon the advice of scientists at the University of California, Chaulmoogra oil, which has arrested the progress of leprosy, will soon be used in the fight against tuberculosis.

The skeleton of a prehistoric animal believed to be over 200,000 years old was unearthed recently in Nebraska.

A sneeze means a great impending calamity to the Hindu mind. Whatever happens on the day that one hears a sneeze is sure to turn out ill, they say, and the Indian will enter upon no undertaking of importance on such a day.

A Canadian has perfected a process of tannage whereby rabbit fur is fastened firmly to the skin and the fiber toughened, which will open a source of almost unlimited supply for a new low-priced fur.

Notification of an increase in rent is not a legal notice if sent by mail in Chicago.

Over 5,000 mules and burros daily pass over the La Paz-Yungas road in Bolivia, which goes from La Paz up and over the Andes and down into the valley of the Unduavi.

The War Department has sold surplus property which originally cost over $1,000,000,000, at a recovery of 63 per cent.

All of the unsurveyed mangrove islands in the Caloosahatchee River, Florida, have been designated as a new government bird reservation.

Two states of Northern Mexico, Sinaloa and Sonora, will return $7,000,000 from the garbanzo (native bean) crop this year.

The average tax burden per capita per annum in France is now 420 francs.

Japan is planning to build 2,225 cars and engines, including 190 locomotives, 457 passenger cars, 50 electric cars and 1,528 freight cars.

The German Government has bought for cash 22,046,000 pounds of American lard at 24 cents a pound.

In 40 years the percentage of Kansas farms operated by tenants has more than doubled. More than 19 million acres of Kansas land is operated under lease.

Four million persons make returns under the Federal income tax.

The state of Oregon has been asked to appropriate $50,000 to handle the attempts to evade the law by means of stills in various parts of that state.

Resources of the banks in the United States exceed the combined bank assets of all other leading nations, with $53,000,000,000 assets in national and state banks, savings banks, trust companies and private banks.

Due to the fact that salmon are taken largely during the spawning season it is believed that this fish will soon be exterminated unless artificial propagation is resorted to.

The wife of a rancher on the Columbia River in British Columbia last year cleared $1,800 trapping with 60 traps.

Farmers of certain sections of Iowa will burn corn instead of coal this winter, a ton of corn having a smaller market value than a ton of coal.

Charlotte, North Carolina, requires a $500 bond to be put up by every taxicab driver in the city. This bond will be forfeited automatically for a violation of the prohibition or vice laws.

Sir Charles Renaud, a black fox used for breeding purposes, is valued at $18,000.

Java furnishes the larger part of the world's supply of quinine.

Sylvia Pankhurst, whose suffrage activities in England caused her to serve many days in prison, is in jail again, this time on a charge of publishing seditious literature.

Every house in the city of Dawson, Yukon Territory, has been stocked up with caribou meat for the winter, and it is estimated there are at least 30,000 of the animals running at large in the vicinity.

General Alvaro Obregon, president-elect of Mexico, has been the guest of several states of the Southwest during October. He has returned to Mexico confident of early recognition by the United States.

One hundred and fifty-four thousand seven hundred vehicles enter and leave New York City daily.

King Alexander, of Greece, who died from the bite of a monkey, was placed on the throne without his subjects being consulted, and much against his own wishes. He married a girl who was not of the royalty or nobility.

The British bark Manrewi, laden with gasoline from San Francisco to New Zealand, is equipped with a wireless telephone, the first sailing vessel ever to be so equipped.

The schooner Bertie Minor, known as the "ocean hobo" has returned to San Francisco, her home port, after an absence of 15 months during which 40,000 miles were covered. So numerous are the South Sea Islands that the skipper spent four months locating a newly established sugar station in the Fijis.

Discovery of a race of pygmies, averaging only four feet in height, is reported by an explorer who returned from Central Africa. The tribe is called the Mambuti and they are known as daring hunters of elephants and rhinoceroses.

A duck that is quackless is being imported into the United States to take its place with the seedless watermelon and the puckerless persimmon. It is known as the muscovy, comes from Russia, and weighs seven pounds dressed when only three months old.

There are about 175 parts in a watch, and in the course of assembling a timepiece it is estimated that 2,400 operations are performed.

American cities would profit by the example of Paris which offers three gold medals each year to the designers of the prettiest houses.

Since the establishment of the republic in China and the waning of the popularity of the queue that nation is losing one of its greatest trades, the export of human hair.

By means of the crescograph, a device invented by Sir Jagadis Chandra Bose, an Indian savant, a number of London scientists have been able to watch a plant growing and study the beating of what in vegetable life corresponds to the heart of an animal.

The British food controller reports that food prices in Great Britain have reached the highest level ever recorded, exceeding largely the high prices of the war period.

The world record for distance telephoning was made by a combination of wire and wireless phones, conversation being carried on between an operator at Avalon, Santa Catalina Island, 30 miles from Los Angeles harbor and the steamer Gloucester, 200 miles off Philadelphia.

The government is running down thieves who appropriated $500,000 worth of platinum from army ordnance stores during the war. The precious metal was stripped from delicate timing, sighting and firing instruments. A woman has been arrested.

The University of Washington is teaching the use of the old-fashioned hand loom for weaving towels, table linen, spreads, covers and dress goods.

Spruce is used in the manufacture of airplanes because of its great strength in comparison with its weight, its uniform texture and its freedom from defects.

Under a new marriage law a Swedish husband and wife may dissolve their marriage on agreement, or legal application.

Men and women who fail to vote in Czecho-Slovakia are sentenced to jail.

Beneath the ruins of a temple in Egypt scientists have discovered a subterranean necropolis containing thousands of mummified bodies of the sacred Ibis, each neatly packed in crumpled papyrus (ancient Egyptian manuscripts) which, say investigators, appear to consist of everything from love letters to washing bills.

A member of the Russian royal family escaped from the Bolsheviki with family heirlooms baked in a loaf of bread.

An architect has completed designs for a proposed landing field for airplanes, to be built over the roof of two of New York's largest hotels.

The Bureau of Chemistry of the Department of Agriculture is experimenting with the manufacture of motor fuel from dried leaves.

George Washington made chaplains a part of the American Army. He issued a call for ministers to join the colors about the same time that he wrote his famous order against profanity in the Revolutionary Army.

A second cable from the mainland to Vancouver Island is to be laid immediately at a cost of $350,000.

Be a Servant, Mr. Harding, Not a Leader

THE campaign is over and a decisive pronouncement by the American people has left no doubt as to the public intention. Whether the vote can be interpreted as a mandate, and if so, what the mandate is, will furnish matter for discussion. But that there was a strong desire for a change of administration, even the most ardent partisan would find it hard to gainsay.

The campaign itself represented a dearth of constructive ideas. Practically the only issue which the candidates discussed with any degree of coherence and continuity was the issue of the League of Nations. Yet it was not the League of Nations as idealistically conceived, but only a certain method of projecting the United States into a League which permitted a certain binding of American action by international military obligations. No one will doubt for a moment that if the issue had been stated as, "Shall we vote for Peace?" the expression would have been just as many millions strong for peace. Neither will anyone doubt that if the question had been, "Does the American people favor a League of Peace?" the answer would have been as decidedly in the affirmative. But the impression was very deep among the people that the present conditions of League membership make it somewhat resemble a League of War, and the United States is sick of war and all that pertains to it.

Taken in all its elements, it has been a strange time. The White House exerted practically no weight in the political development of the campaign, from the time of the conventions onward. Indeed, it may be said that the decline of Mr. Wilson's influence in contemporary American politics began before his second return from Paris. This, together with the strange apathy with which the sick man in the White House has been regarded, may be accounted for by the letdown which occurred in public hopefulness between the opening and the closing of the Versailles conference. On the matter of the strange lack of sympathetic expression for Mr. Wilson, however, it is perhaps to be remembered that the public has never been made fully aware of the extent of his physical disability.

The election of Mr. Harding, as he himself has very frankly said, was not a personal tribute to the man. All that was said at the time of his nomination concerning his lack of public fame was true. He was but little known. It is perhaps a testimony to the fact of his being well known, though only to a few, that those who knew him went so far as to indorse him for the Presidency. They felt he had the capacity to rise to presidential heights. It was Woodrow Wilson who once said that "no man is fit to be President until he is made President," which has been often true.

Mr. Harding, however, gradually grew in the esteem of the people as the campaign progressed. Questionable in August, he grew into acceptability before November. He exhibited poise and discretion in several difficult matters, as well as a disposition to speak his mind as clearly as possible when speaking was called for. He maintained the personal dignity and the intellectual simplicity which we have been taught to expect in aspirants for the Chief Magistracy. His eventual selection for the office was received with a degree of quiet and a modesty of expectation which augur well.

If Mr. Harding is wise, he will see to it from this day forth that he shall not become entangled with some of the forces which proved the undoing of Woodrow Wilson. If he will always look away from the men who will try to surround him, to the millions of Americans who have elected him; if he will always refrain from alliances or acts which he would hesitate to exhibit in every city and under every circumstance; if he will be distrustful where the people are distrustful; if he will only abide by the few strong instincts and the few plain rules which have always proved our best guide and defense, his administration will be successful and his name honored.

It is not brilliance that the American people expect of Mr. Harding, but soundness and dependability. There have been administrations so brilliant that they got in the way of the Nation, and impeded its normal development. After all, the great thing is the American Nation. *It* is the central spectacle. *It* is the exalted entity which must be served. The Administration is but one of the servants.

There have been Presidents who struck so compellingly certain chords which rule the popular imagination, that they quite obscured the American Nation. They have been, as it were, in the place of the American Nation. They were the central spectacle, they the exalted entity. Not so, however, with our most useful Presidents. We can forego a great deal of genius if we can only get enough of the salt of Yankee common sense in the White House. That sort of sense has always proved quite adequate for internal or international affairs.

No President really leads the American Nation. He may formulate what it is thinking; he may say what it is saying, but ultimately it is the American Nation that decides and leads. The Nation will stand by the President who stands by the Nation.

The coming four years may be quiet years politically. Presidential fireworks may be wholly lacking. If so, well. The country needs to be allowed to find its feet again. It needs the sense of confidence that its general manager in the White House is attending to his job, in all its details. With this confidence, the country will go back to its own job and start in anew.

Many Men of Many Minds

Talcott Williams, journalist.—We shun crisp diction, fresh from the people. So all speech began. When a tongue ceases to spawn new words, fresh phrases, novel images, thought and progress stop also. The closer to daily life and speech is the writer's pen or the click of the typewriter keys, the more active, the more efficient, the more effective is the utterance of the writer and the life of the people. So long as accepted and acceptable writing accepts and shares the daily changes of the vocabulary of the market place; so long as both live and move and have their being in the sun of passion, action and achievement, the more lasting, pungent and penetrating is the literature of the period.

Frank Tannenbaum, economist.—The average professional criminal begins his career as a boy, often as a child. Some of them begin their lives of "crime" as early as the age of seven. More than twenty per cent of our criminals are under twenty-one.

Richard T. Ely, professor, political economy, Wisconsin University.—Failure after failure marks the successive steps in the downward course of Russia under Bolshevism. The Bolshevists wanted collective property in land and collective management. They robbed the old landowners and stopped the sane and very remarkable land reform then in progress, but by turning land over to the peasants they have merely strengthened the class that adheres to private ownership. Yet the peasant proprietors do not enjoy the full blessings of private property in land, because, rightly, they feel insecure in their titles. When the peasant becomes rich, will not a poor peasant seek to dispossess him? When robbery begins, when and where will it stop? But that is not all. Bolshevism having paralyzed industry, the people in the cities have nothing to exchange for what the peasants produce except worthless paper, and of that the peasant has had enough.

Land Hunger of the Peasant Blocks Bolshevism

W. W. Roper, head coach, Princeton University.—The difference between the old game of football and the new is, roughly, the difference between a battle of full-witted rams, butting each other as stupidly as tenaciously, and a clash between two masters of fence. There is a thrill in both of these but I think most of us will find a keener thrill in lightning thrust and parry than in patient forehead bumpings.

Guy Hayler, of London, president of World Prohibition Federation.—Throughout India there is a general feeling that, under further measures of Home Rule, prohibition will be almost universally adopted. News is to hand from South America that the evils resulting from alcoholism demand strong and immediate attention. Regarding the great continent of Africa, it is noted with thankfulness that the Covenant of the League of Nations declares in favor of "the prohibition of abuses such as the slave trade, the arms traffic, and the liquor traffic."

M. Francois Marshal, French minister of finance.—Impartial Americans who have traversed France this season must have noticed the industrial and agricultural activity in every province they visited. Our exports have increased from one-fifth of our imports during the first half of last year, to one-half of the imports for the first half of this year, representing a 72 per cent gain in value.

J. L. Benton, director of Philadelphia Textile Manufacturers Association.—Between 110,000 and 125,000 employes of textile mills in Philadelphia will be out of work this winter unless they watch their step. The weeding out has already begun. Approximately 40,000 have already been dropped. Whether the remainder will follow depends to a considerable extent upon the workers themselves. The textile manufacturers are not opposed to unions, but they are opposed to radical leaders and are going to the mat here and now with them.

Luther B. Bewley, director of education for Philippine Islands.—Probably the greatest unifying factor and the most potent tie of political union in every country is a common national language. English is more appropriate as a national language than any other because it is the best suited for communication with the outside world.

Melvin T. Copeland, of the School of Business Administration of Harvard University.—As long as the money market remains stringent price declines are likely to continue. Eventually, after the stocks of merchandise on hand at the present time are partially liquidated, the accumulation of banking reserves and the tendency to curtail production in some industries may be counted upon to reduce the strain upon our credit resources. Sooner or later this will tend to bring about lower discount rates on commercial loans.

Daniel T. Murphy, vice president, Northwest Irrigation Association.—If, as an irrigationist, I were seeking to convey luminously to another, unlearned in my science, the spirit, the soul and the atmosphere of the western art, I had rather use the word "aquaculture" connotatiously, than "agriculture" correctly; for irrigation—greater than either—lies between the two.

Daniel Willard, president, Association of Railway Executives.—If the railway managers are men of vision, if they realize their responsibilities as semi-public servants, as well as trustees of property of great value; if they feel that the policy of private ownership of property is upon the whole the best policy, I believe they will succeed in their undertaking and private ownership of railroads will continue.

Frank H. Simonds, war correspondent.—No one can fail to remark the odd circumstance that whereas, a century ago, all Europe was united against the radicalism of France and the doctrines of the French Revolution, France stands now almost the single unshaken stronghold of conservatism, against the radicalism of the Continent, and, for that matter, of the British Isles.

Camille Flammarion, French astronomer and scientist.—As a scientist I cannot affirm that the soul is immortal. I do affirm that the soul lives long after the body is dead, and that in time man will be able to control the fluids which make communication between the realm of death and life possible.

Fred C. Kelly, journalist.—Before hiring a man on the strength of his letters of recommendation, it is well to remember that there is many a man to whom one might give a strong testimonial in order to get rid of him.

Edwin A. Goewey, sporting editor.—If professional baseball is to be rescued from the crooks and returned to its once honored post among the world's sports, the game must be given the most thorough house-cleaning it ever had. No more whitewashing of men who demonstrate that their pledged word means nothing to them, no more sidestepping of deliberate violations of the rules for fear that publicity will interfere with the click of the turnstiles, no more tricky playing to win games!

Everett Kimball, professor of government, Smith College.—Seriously, the ballot is the most important political instrument we possess. It is our weapon. What care and ingenuity was displayed in designing and testing the Springfields and Brownings that the American Army used! How carefully the soldier was instructed in the mechanism of his weapon! With what good effect he used it! But in civil life the ballot is even more important than were guns in war. We may talk of public opinion, of good government and bad. We may write letters to the newspapers. But the ultimate and final way we have of controlling the political action of the government is by our vote. The ballot is our sole and ultimate weapon.

Ballot Your Bullet in Defense of Good Government

Thomas A. Edison.—I believe that life, like matter, is indestructible. There has always been a certain amount of life on this world and there will always be the same amount. You cannot create life; you cannot destroy life; you cannot multiply life.

Count Johann-Heinrich Bernstorff, former German ambassador to the United States.—The Russo-Polish War threatens us with grave dangers. Germany must maintain strictest neutrality because any other policy would lead us to destruction. We who desire the peaceful reconstruction of Germany on a democratic basis must keep in check our own Bolsheviki, and those few who would like to put their swords at the disposal of the Entente for the fight against the Bolsheviki.

Theodore Roosevelt.—After a certain not very high level of material well-being has been reached, then the things that really count in life are the things of the spirit. Factories and railways are good up to a certain point; but courage and endurance, love of wife and child, love of home and country, love of lover for sweetheart, love of beauty in man's work and in nature, love and emulation of daring and of lofty endeavor, the homely work-aday virtues and the heroic virtues—these are better still, and if they are lacking, no piled-up riches, no roaring, clanging industrialism, no feverish and many-sided activity shall avail either the individual or the nation. I do not undervalue these things of a nation's body; I only desire that they shall not make us forget that besides the nation's body there is also the nation's soul.

Rev. Mr. Benjamin H. Spence, secretary, Dominion Alliance.—One former provincial official is now in the penitentiary for using his position in conjunction with the big interests for bootleggers and others. The law which he brought into contempt has never recovered from the damage done nor shaken off the odium. Some people learn by bitter experience. Evidently quite a number of such people live in British Columbia. South Carolina and Saskatchewan tried an almost perfect system of government control and it was a failure. Both replaced their laws with prohibition.

Kenneth L. Roberts, correspondent.—No prophet who ever lived, and no student of immigration, no matter how weighty his brain, is capable of figuring out the number of foreigners who can be assimilated by the United States in a given period of time. If they are allowed to live in the slums and ghettos and foreign settlements in which they are now living, they cannot be assimilated. There isn't a chance of it.

George Ellery Hale, director, Mount Wilson Observatory.—Go out under the open sky, on a clear and moonless night and try to count the stars. If your station lies well beyond the glare of the cities, which is often strong enough to conceal all but the brightest objects, you will find the task a difficult one. Ranging through the six magnitudes of the Greek astronomers, from the brilliant Sirius to the faintest perceptible points of light, the stars are scattered in great profusion over the celestial vault. Their number seems limitless, yet actual count will show that the eye has been deceived. In a survey of the entire heavens, from pole to pole, it would not be possible to detect more than six to seven thousand stars with the naked eye. From a single viewpoint, even with the keenest vision, only two or three thousand can be seen.

Visible Stars Not as Numerous as Popularly Believed

Henry Grady, United States trade commissioner to Europe.—The necessity of the United States seeking other foreign markets than Europe is made further imperative by reason of the falling prices of commodities in this country. We must seek these other markets to keep up American production of industries.

F. Roger Miller, secretary, Chamber of Commerce, Macon, Georgia.—The United States is the only nation in the civilized world that has ignored housing as a national problem. The condition has been developing for years—it is not an outcome of the World War. Only 20,000 new homes were built in 1918. Twenty times that number were needed. Our normal increase this year calls for the construction of 1,250,000 dwellings.

Meredith Nicholson, writer.—In private affairs we resent being fooled, for to be swindled reflects upon our intelligence and is an affront to our dignity. In public matters we are stupidly tolerant of political tricksters and prone to indulge them, even to grin good-humoredly at their cleverness and insolence.

General Alvaro Obregon, president-elect of Mexico.—The Mexican Government is strong, popular and ready to comply with its international obligations, and I believe Mr. Wilson will have no objection to sanctioning recognition. I also believe that the people of the United States in close touch with us in commerce desire such recognition.

Charles E. Mitchell, president of National City Company.—It is, after all, merely a question as to whether or not all classes of American commerce are willing to co-operate to bring about sane, slow but steady deflation or whether resentment against the inevitable, accompanied by bitter attempts of one class or another to avoid for itself the burdens and sorrows of deflation by shifting processes, which must ultimately be futile in effect, will force the old economic law to take us all by the nape of the neck and shake us through panic to a proper recognition of and submission to her inexorable requirements.

Francis H. Sisson, vice president of the Guaranty Trust Company, of New York.—If one of the partners in our industrial business agrees to do a certain thing in a certain way, and fails, the firm contracts become impossible of fulfillment. If Labor agrees to supply effort at a given price, and Capital agrees to furnish certain supplies upon which Labor may expend its effort, both must recognize their responsibility. It has been said that the laws of contract are inviolate, and they must be. If we will consider the matter for a moment, a violation of contract precipitated the world into the most terrible war in its history. When contracts become impossible of fulfillment credit is injured and once more the industrial structure rocks.

The New Crusade for Children's Rights

By FRANK M. CHASE

RIGHTS—rights of women, rights of the public and now rights of children. Where? In Kansas, of course. One scarcely thinks of the Sunflower State nowadays without also thinking of rights of one kind or another. But what could be more natural than that the women of this state, the first to gain the right to vote, should lead in the crusade for the rights of their children? This they are doing, and with such vision and high purpose as to set new standards in social progress.

An unfortunate circumstance of child welfare work is the popular misconception of it. Our view of it, generally speaking, is distorted and narrow. Child welfare involves very much more than feeding and clothing the impoverished children of the slums or benefiting the abnormal boy and girl in some way. The needs of the normal child on the farm deserve as much consideration as those of his less fortunate cousin starving in the tenement. In its best sense child welfare is a perfect example of democracy, admitting of no class or racial distinctions.

Happily, such is the conception of the Kansas women. Acting on this broad basis they have laid out their program in such a way that every person in the state with the welfare of a child at heart, may pull together for the good of all the state's children. To accomplish the greatest good, for the most children, in the shortest time possible, is their high ideal.

The directing force of their effort is the Kansas Women's Committee on Child Welfare. This consists of one representative from each of twenty leading state organizations, who represent the special interests of children. It is better described in the words of its secretary and organizer, Dr. Florence Brown Sherbon, as "an adventure in teamwork, born of the desire of the women of the state to work together in some big organic effort, rather than in a multitude of isolated, unassociated projects."

Doctor Sherbon is chief of the Division of Child Hygiene of the Kansas State Board of Health. As the members of the committee would tell you, she is also the real inspiration behind this remarkable movement. Of winning personality and herself a mother, she is able to convey to others her broad vision of child welfare. To her ability to inspire and to arouse enthusiasm must be given much of the credit for the wonderful success in co-ordinating the women's organizations of Kansas into a powerful unit for advancing the interests of children.

Upon its organization, in October, 1919, the committee adopted the Minimum Standards for Child Welfare as a general working outline. These standards were formulated by the International Conference on Child Welfare held at Washington in May and June, 1919, and are being promulgated by the Children's Bureau of the United States Department of Labor. They are generally considered the best existing statement of the minimum protection that children should receive.

With these standards as a basis for its activities, the committee laid plans to proceed along three important lines: first, survey the entire state, to determine the existing conditions with reference to the various interests of childhood; second, engage in an educational campaign for the purpose of suggesting remedial measures for each community's particular defect; third, work for the appointment of a children's code commission.

To the great joy of the committee, the last-named phase of its work was the first to be accomplished, and practically without effort. Governor Henry J. Allen was found to be deeply sympathetic with the movement to better the opportunities of the children. On but learning of the plan of the Kansas Women's Committee on Child Welfare, therefore, he eagerly acquiesced in it. As a result the Children's Code Commission is now at work.

The survey, which has been in progress since last spring, is turning considerable new ground in the field of child welfare. To those persons who are accustomed to think of a child welfare survey as an investigation covering an isolated district of a city, made by well-to-do young women spending their spare time in settlement work, the Kansas survey would appear as a revelation indeed. In the first place, it consists of a detailed investigation of the entire state, being the first child welfare survey to do so. It is also distinctive in that each community is surveying itself. Thus the community finds its defects through its own efforts; and, having uncovered them in this way, it may be depended upon to remedy them speedily. In the remedial work the state committee renders assistance, when called upon to do so, but the burden of providing the relief rests upon the local initiative. By thus applying the democratic principles of self-help and self-determination to the conduct of the survey, child welfare is given its rightful meaning as something for all children instead of for only those in need of special care.

The scope of the survey is limited to an attempt to uncover actual community conditions as to: first, children in industry; second, the health of mothers and children; third, dependent, defective and delinquent children. Every precaution is being taken to keep the survey strictly impersonal. That the entire procedure may be kept on a plane above gossip, the survey workers are instructed to permit no names or personal data in any written form. Facts, not names, are sought.

Determined upon doing a thing, Kansans usually set about their task with the ardor of crusaders. The campaign for their children's welfare is no exception to the rule. In the method of organizing for the survey and in the zeal displayed in carrying it out, indeed, one is reminded of the war drives in which the state successively "went over the top" with colors flying. And if the enthusiasm manifested in the surveys of the first counties is any criterion, the colors are not going to trail on the ground in the present crusade.

This survey, which will reach eventually into every nook where a child might exist, is being directed by the Kansas Women's Committee on Child Welfare through a succession of chairmen for the congressional districts, counties, and towns or cities. In the rural communities the school district is the survey unit, the local chairman appointing two or more canvassers for each district. In cities the territory is divided according to local needs and conditions. The canvassers work in the neighborhoods in which they reside, and there has been no difficulty in obtaining sufficient workers to conduct the survey or in securing the answers to the questions. The questionnaire used by the canvassers fills six typewritten pages, providing for the gathering of every possible bit of information bearing on the welfare of the state's childhood. The survey of Riley County, which was one of the first to be made, illustrates the organization necessary for gathering the statistics and the enthusiastic willingness of the people to do their share of the work. In this county the entire survey was planned and executed in one month. Despite unfavorable weather, the collecting of the information in the rural districts required but one week; while in Manhattan, the leading city of this county, the survey was completed in one day. About two hundred and fifty women were chosen to make the canvass in this city. At the blowing of a certain whistle at nine o'clock in the morning, the pre-arranged signal, every canvasser began her part. So carefully and minutely was the city districted that no worker had to spend more than one and a half or two hours in making her calls.

DR. FLORENCE BROWN SHERBON

Chief, Division of Child Hygiene, Kansas State Board of Health

Not one person in this county refused to supply the information requested by the canvassers. This was largely due to the fact that a thorough publicity campaign carried on through speakers and the press had prepared the way for them. Everyone knew beforehand of the survey and its purposes.

In arranging the surveys the aim is to interest and give a share of the work to every local women's, civic, business and religious organization. Usually this is not difficult to do, the advantage of the child welfare survey to a community is so evident; for it should be remembered that such an investigation unearths the good points of a community as well as the weak ones. The extreme willingness of the people to share in this work is well expressed by Doctor Sherbon, who has said: "The people of Kansas were never so alive to the interests of the children as they are at the present moment. Everybody wants to do something for Kansas children. If 'everybody' can only get behind a plan which is organic, elastic and permanent, it should be possible to accomplish much during this reconstruction period. Social ideals are now fluid, but will rapidly set into the permanent mold of post-war habits and traditions. Now is the time to shape these ideals for the lasting benefit of children and society."

From the beginning of the campaign the state committee has urged the women's organizations to discuss child welfare in their meetings, that their communities might be in better shape to remedy their deficiencies after the survey had unearthed them. To aid them in doing so, the Kansas members of the Association of Collegiate Alumnae prepared a set of twelve club study programs based on the International Minimum Standards.

These programs consist of references which have been carefully selected with a view to assisting interested groups in preparing popular presentations of the various phases of child welfare. They are so arranged that several short papers may be developed on each phase of the subject. The general topics are as follows: children in industry (in two parts); maternity; infancy; the pre-school age, two to six; school children (in two parts); adolescent children (in two parts); dependent children; defective children; delinquent children.

Through these programs the organized women of the state are being brought to see the many ways in which they can promote the welfare of children and to understand the community's relation to everybody's child. They are a new and distinct contribution to the literature on child welfare, and have been widely commended by public health workers. The college women have also prepared authoritative outlines containing extended references on each of the foregoing topics, for the use of communities desiring to make detailed studies of their particular problems.

Another valuable contribution to the educational part of the campaign was made by the Women's Bar Association of Kansas. This organization has a representative on the state committee, through whom it pledged to answer all requests of women's clubs for information concerning the state laws which bear on child welfare.

This survey which the women of Kansas are directing is no spineless and toothless affair. It is not being made, as many surveys have been made, for the purpose merely of gathering information. Its well-defined object is to find the weak spots of the state and its communities with respect to child welfare, in order that remedial measures may be trained upon them.

As soon as the results for the state as a whole are known and tabulated they will be placed before the Children's Code Commission, to aid it in shaping legislation to meet the special needs of Kansas. Each community will also be urged to follow up the survey by attending promptly to its greatest need. For its assistance the state committee has community programs worked out to fit the various local needs uncovered by the survey. Thus, if a community becomes aware of a bad milk situation, this committee is prepared to put it in touch with the best available aids and to offer suggestions for putting on a pure milk campaign. If the community decides, after the survey, that it should have a school nurse, or a county nurse, the committee will suggest methods of getting one. Another community may feel that the results of the survey justify it in trying to obtain a full-time county health organization. Still another may have a critical recreation, delinquency or school hygiene problem. Whatever the problem, the help of the state is volunteered in meeting it.

As an illustration, one of the first cities of Kansas to make its child welfare survey found that its special need was a children's health center. On the other hand it obtained much satisfaction through learning that it was caring especially well for its defective, dependent and delinquent children. The residents of this city, incidentally, were so well pleased with their good showing that they straightway volunteered the money for correcting its weakest spot.

It is not unlikely that the Kansas women will add to their other influence in bringing about the program for the rights of their children the power of the vote—their vote. "While the communities are carrying out their various follow-up activities," said Doctor Sherbon in addressing the survey workers, "the fall elections will occur. It is to be hoped that this survey will inject some new issues into local and state politics, and that the votes of the people will be given to those men and women who will pledge themselves to a platform of children's rights.

"When the legislature convenes and the Children's Code Commission submits report, this survey machine should convert itself into a gigantic legislative committee to see that a constructive legislative program goes through.

"This federation of effort and interest should persist until every local condition inimical to the well-being of children is corrected, and until every weak law is strengthened, all necessary new legislation passed, and then be passed along to the next generation in order that the legislation may be enforced and social education proceed along its evolutionary course.

"Kansas women have won their rights. They are in a new crusade for children's rights. The thing which we have undertaken is tremendously important and significant. From the spirit shown it bids fair to be another achievement in which Kansas will lead out and set a pace for the world. Kansas has been at the head of the procession in prohibition, women's suffrage, and in cigaret and industrial legislation. It seems certain that she will be a leader in the new crusade."

The Fate of Class Movements

THERE is one feature of the election, overlooked in the natural interest in the main developments, which will receive more attention as time passes and final results are tabulated in a form which will permit accurate comparisons. That feature is the collapse of the claims of the so-called class movement in the United States.

The Socialist party claimed that it would garner as high as five million votes. The Farmer-Labor party expected to receive the support of hundreds of thousands of progressive Republicans and Democrats. The Non-PartisanLeague believed it would sweep an extensive section of the West. But none of these things came to pass. The Socialists showed a gain, to be sure, but the total vote for Debs will, on the face of the present returns, be closer to two millions than to five. The Farmer-Labor party did not even dent the consciousness of the American people. The people had sized up the party, its platform and its candidates during the Chicago convention and had decided that this was not the third party, but merely a false alarm.

The Non-Partisan League, which has ruled North Dakota for four years, electing state and congressional officials and enacting a large number of class laws, had high hopes of gaining a foothold in Minnesota, Montana and Colorado. It not only failed in its campaigns abroad but suffered some disastrous reverses in its own camp, and while it succeeded in saving a fusion candidate for United States Senator and re-elected a number of state officials, it lost the state legislature and one of its two members of Congress.

Those who feared that the parties which represent class interests would attract an imposing number of votes based their beliefs on the assumption that there was not only a strong undercurrent of class spirit in America but that there existed a sentiment of general dissatisfaction with the conservative spirit of the two major parties. This view has been widely press-agented but apparently its only result was to make the American people fear the worst but work for the best.

It becomes evident, therefore, that one of the outstanding facts of the recent election is that the American citizen believes in home-made political thought; European fashions in political garments do not overwhelm him. He is content to wear the old, honest, homespun politics, of American manufacture, varying the cut now and then to agree with more modern lines, but clinging always to his faith in a fabric which he believes will wear the best.

In other words the American citizen makes a poor Red. He is not even a Rose Pink.

Paying Paul But Starving Peter

THE Osage Indian reservation in Oklahoma contains some of the richest oil lands in the United States and the development of their resources is bringing undreamed-of wealth to the owners. It is estimated that the least any member of the Osage tribe will receive in 1920 will be $9,000, and since the families generally consist of four or five members there will be between $36,000 and $45,000 distributed in many of the Indian homes this year.

From time to time the newspapers print new incidents reflecting upon the manner in which the Indians dispose of this sudden wealth and one reads of a red man who sends a taxi after a pound of beefsteak or of a brave who buys an expensive, high-powered car and hires a chauffeur to drive him endlessly through the streets of the nearest town.

Perhaps some of the incidents have been exaggerated but the sudden showering of wealth upon the Indians and their inability to handle their money wisely, which is the foundation of all these stories, exist in fact.

There is some poetic justice in oil being found on lands turned over to the Indians by the white men but the pitiable part of this whole thing is that when fortune finally decided to smile upon the red men she chose one little group which is no more entitled to the oil lands of Oklahoma than thousands of other Indians in the United States.

The Osages who now summon their limousines and drive into the village in upholstered luxury to do their shopping were placed in Oklahoma by the government several years ago, and given the lands they now occupy in lieu of a barren reservation they occupied in Kansas. It would be pleasant to record that the Osages toiled willingly upon the broad acres of the new state and that as the result of their labors fine farms took form and great herds of cattle grazed and grew fat upon the land. But it cannot be so written. The white man, of course, says the Indian was lazy. The Indian, perhaps with considerable justice, retorts that the white man kept the best land and gave him a tract of poor soil which was adapted to neither farming nor stock raising. At any rate the Osages dragged out a miserable existence in their new homes and did not bother to improve their title to their lands by dint of industry. Then oil was found and in less than a year the Indians were on the road to wealth and the reservation gave signs of becoming the richest community in the United States.

At least a share of the money from oil and leases in the Osage reservation should be devoted in some way to advancing the conditions of the 250,000 Indians in the United States whose title as wards of the government is certainly as good as those of the lucky red man of Oklahoma, and many of whom are living today in genuine poverty.

The thing can be done easily enough. There will be no trouble whatever in finding worthy ways of investing this money so that its benefits will be perpetuated and will serve to educate and to better the opportunities of future generations of these first Americans. All that is needed is a little constructive thought, and after our long record of injustice, of cruelty and of bungling kindness in our treatment of the Indians it would seem that we would do well to consider it.

Well Done, Wisconsin!

WISCONSIN announces with pride—and rightly so—that 87.7 per cent of the farms within her borders are cultivated by the owners. With many states complaining of a drift away from the land, this record has not been achieved in Wisconsin without cause, and one will rightly imagine that the efforts put forth to accomplish such results must have been so pronounced that they will not be hard to discover.

Wisconsin, like many north and northwestern states, has thousands of acres of uncultivated cut-over lands. Like all such states it also is anxious to see such lands settled and developed. The difference between Wisconsin and some of its sister commonwealths lies in the way it has gone about the accomplishment of its desires. Where other states left the colonization of their lands to real estate dealers, honest or otherwise—and history shows they were often otherwise—Wisconsin has officially recognized her responsibility and has taken pains to perform this duty faithfully with regard to both the settlers and the state's best interests.

The immigration division of the state is in charge of the work. It safeguards home seekers against promoters who offer worthless lands for sale; it keeps an eye on land agents, censors their advertisements and handles the publicity which the railroads give to undeveloped lands. Last year alone it gave honest advice to 14,000 colonists in search of farms and was actually responsible for placing almost 1,600 families.

One of the immediate results can be seen in the figures which show that while many states record an increased number of tenant farmers or abandoned farms during the last 10 years, Wisconsin can point to an increase of six per cent in farm ownership during that time.

The true results cannot, of course, be measured now. Only the future can tell how bountifully Wisconsin will be repaid for the care with which she tended the flame of hunger for land ownership until it glowed so brightly that it outshone the alluring glow of the cities. But none can doubt that among the richest rewards will be that type of ideal citizenship which is ever characteristic of American communities where men own their homes.

Watch This Movement

LOOK over your newspapers carefully and see if you can detect a new dose of pro-whisky propaganda. Not that your local editor or newspaper owner is that kind of a man; it is in the material he buys from the big syndicates and special writers.

The new pro-whisky propaganda has two main lines of attack.

The first is that prohibition is going to cost a lot of money for enforcement. A very suspicious amount of publicity is being given to the cost of enforcement last year. Interests who saddled the country with the incalculable costs of poverty, crime, insanity and drink-sodden citizenship, are now becoming very tender of the public purse in the matter of keeping the whisky woff out of the land.

The second line of attack is that prohibition is not prohibiting. Of course it isn't; the interests that own the whisky see to that. But the saloon is prohibited, millions of men are drinkless and sober who would otherwise be but half-men today. With the help of the straggling army of topers who will guzzle their drink as long as they can obtain it, the interests which own the liquor are making a desperate attempt to keep up the semblance of a whisky business in defiance of the law in order to impress the people with the fallacy of prohibition.

The liquor in the United States is owned and traded in illegally by one class of people almost exclusively. It is a class which has always lived off the corruption of another class. It is a small class, conscienceless, rapacious, and bound together by ancient bonds. This class poisons the flesh with whisky, just as it poisons the mind with ideas of social disorder. The insistent propaganda which is now being spread broadcast through the American press on the plea of writing something interesting is hastening an exposure of some importance.

When newspapers and theaters join to keep King Booze alive—whose work do you think it is?

By Trial and Failure

IT IS said that a young associate of a great inventor once came to him discouraged, with a disheartening story that he had been working on a machine and could not succeed in making it go. "Well," replied the inventor, "keep on fooling with it till you do."

He understood the man and knew that he had worked for many months, earnestly and patiently, to achieve perfection in this particular piece of mechanism. He also knew that life is made up of a series of experiments, and that we hope each turn will bring the success for which we are striving. But the patient inventor also knew one thing more: he knew that if an honest endeavor is persisted in, success is sure to come.

So it was that the younger man turned again to his task and—as luck had it—that very day happened on the lucky combination of working parts for the machine which "made it go."

The principle of "trial and failure" is one well recognized among scientific men. It means that when a certain combination of chemicals or machine parts fails to produce the desired result, the experimenter simply counts the time spent on it as bringing him just that much nearer the solution of the problem—one more step has been taken, one more of the unknown number of wrong possibilities has been eliminated.

It's just one more trial and failure—but in the end, the proper combination must be found, the last difficulty overcome by force of sheer persistence, and the goal achieved.

In life we struggle until we learn the way that brings Success, the real Success, with a capital "S."

In the end, if we persist in earnest always bending every effort to reach a definite goal, that goal will some time—perhaps in years, perhaps in days—appear. It may require hundreds of determined efforts—each followed by a discouraging failure—but one never knows when the next attempt will be the lucky one.

Who knows how much the world has been advanced by the persistence of the men who have continued to stand up, with determination, after many crushing failures, and said through clenched teeth: "I will try it again—and again—and again"?

And who knows how many life failures might have been turned to brilliant successes with just one more try for success?

Success doesn't step forth and salute the quitter. Unless you've already discovered it, it is still in waiting—yours perhaps at your very next effort.

Don't quit—don't even think of quitting—until you've found it!

Mr. Ford's Page

IT BECOMES more and more apparent that the mind of the nation is in a hopeful, forward-looking mood, quite free of the uncertainty and apprehension which a little while ago was present. The long solemn striking of the hour is usually a period of rest, when strange presentiments and questions come to mind, but when the long drone of the strokes has died away, initiative flows in again and the mind awakes to the calls and opportunities of the new hour.

The clock-strokes of destiny are sometimes months and years long, and the reverberations longer still. In the affairs of humanity the great things do not occur in a flash and die out like a rocket; they come into being gradually, mount to their crisis, and disappear with discouraging slowness. Very few lifetimes are long enough to see the completed cycle of even the lesser events.

But, though this be so, there is a consciousness within the mind whenever the new era is actually begun. It is like dawn, when even the air is different, and a new magnetism seems to thrill through all things. And there is a sense of this newness in the air today. Men are more convinced than ever they were of the eternity of the right, and of the possibility of sincerity maintaining itself through countless errors until the right way is won.

No one who is socially conscious would think of denying that the right way in many things is yet to be found, but it is usually a mistaken social consciousness that insists that the wrong things are here by intention. Men do not make mistakes by intention, and there is no way of learning the right way except by making mistakes.

Mistakes, whether they occur in the social region or in the building of a new machine, occur as the result of active research. The mind knows the end which it wishes to reach. It sees an opening here, and enters it. It explores far enough to discover that the opening does not lead where the mind wishes to go. Another opening is explored in like manner, and withdrawn from. And so on, experience being gained at each step.

This is not waste, by any means. It is not evil. It is not blameworthy. It is part of the material of knowledge. You know your way from your home to the shop, but a real part of that knowledge is the other knowledge that certain other ways do not lead to the shop. That negative knowledge is in the back of your mind, unused; but it is a part of knowledge just the same.

In the matter of living together in society the same rule obtains. What does not work, we know is wrong. What does not work perfectly, requires improvement. What breaks down periodically, requires strengthening. But if the whole thing is wrong, it will not work at all, except perhaps destructively and wastefully. In mechanics there are many things that will work, but not well. Take, for example, the numerous accounts we read in the papers of the discovery of a new fluid fuel. A man announces that he has discovered a new motor fuel which has given such-and-such a performance at such-and-such a cost. Maybe he has. After months of research he doubtless has. But there are other points to be considered. Is there enough of his basic material to produce millions of barrels of that fuel a month? If not, he has discovered something, but he has not discovered *the* thing. And then there is the effect of that fuel on the motor that uses it. Some new fuels are discovered, no doubt; they make things go, no doubt; but some of them completely destroy the motor that uses it. Drive 75 miles and the machine is ruined. It is obvious, then, that although a discovery has been made, it is not *the* discovery.

But the work is not lost. The individual's personal ambition may be frustrated, but his usefulness remains just the same. He has demonstrated something. But the wise world is not in a hurry to be off with the old and on with the new until it is demonstrated that the new can bear the burden which the world will have to place upon it. We may grant that many of our ways of doing things are crude; we can look forward to a time when those who come after us will improve vastly on what we have done. Still, we may be confident of this, that within our range of knowledge and necessity, we have made things work, we have found certain principles, and while there may be newer and better applications of these principles, we have laid the foundations.

Certain foundations have been laid in the region where we adjust our relations to each other as social beings. We all have the same needs, and we are all subject to the same necessity of supplying them. And that necessity is relentlessly the same: needs can be supplied only by work, someone's work. Not only relentless but inevitable in this necessity, for it is marvelous to consider how very, very few in the world can live without work. There are a few aged, a few ill folk, a few pitiable offspring of the wealthy—that is all. Of the rest of the world, of any condition, those who work are a mighty ocean, those who do not are but a handful.

There are parts of the world where this principle of work is not understood, but it is painfully forcing its way into understanding. There are perhaps more parts of the world where the differences in work are not completely understood. Some work in one sphere, some in another; the spheres fit one another. In the ordinary household the husband is the breadwinner, the wife the manager of all the home affairs; both work in their own way, and the product of their joint toil is the home. In the industrial world these spheres are duplicated, the managerial and the manual, both of them being more commingled than ever before, and the joint product is service to the world and a living for the men who render the service.

What needs to be done is obvious—the winning of security for those who work, whatever their work may be. All human affairs are mutable; the factor of individual discipline steps in at unexpected moments; there are troubles and difficulties of one kind or another assailing all people of all kinds. Sorrows and joys, disappointments and anxieties, losses and tragedies are not the monopoly of any one group. Every life is very much like another these days.

But it should be made possible—indeed, it is perhaps not too much to say that it can be made possible—for every man to be assured at least that there will always be the opportunity for work afforded to him. The basic insecurity of the industrial realm may at least be abolished, even though the other insecurities of life remain what they are.

Perhaps one way out will be the adoption of the old adage not to put all of our eggs in one basket. The farmers of the South have learned the risk of the one-crop system. If the whole farm year is staked on one crop and that crop fails, there is total loss. But with a variety of crops the danger is decreased.

Now, employment today has tended to fall into one basket. There is a variety of work to be done in the world, but most men confine themselves to but one kind, and when for any reason slackness occurs there, they suffer idleness. This is due, of course, to the way in which industry is organized.

There are three main divisions of work: growing the food and clothing which people use; manufacturing the tools with which these necessities are raised and turned into articles of use; transporting both to those who need them. Growing, Making and Carrying—these are the three principal things we do. And as there is always something to do in all of these lines, at least always in two of them, unemployment would not occur if industry were organized with a view to the whole need. This would seem to be one direction in which progress can be made for the purpose of giving security of employment. And with this assured, other improvements could be undertaken without that stress of mind and need which makes so many advances.

EXPERIENCE is partly made up of mistakes. Knowing what not to do is an integral part of knowledge. If the machine does not work very well, it may not need to be scrapped, but adjusted. The fact that a machine, a method or a system works at all, without destroying itself and others, may prove that it can be made to work more perfectly. Some people favor scrapping the social system. But if it works, even though jerkily, it may only need adjustment. There is no ingenuity in simply destroying things. If work is fundamental, if industry is really a beneficial and productive fact, then the jerks and imperfections which accompany it, like unemployment or uncertainty of employment, would seem to be susceptible of adjustment. Cure the defects without destroying a fundamentally good and tried method.

His Goats Save the Lives of Hundreds of Babes

SAVING the lives of hundreds of babies and small children throughout the United States by raising milk goats as a diversion from his law business is the unique pastime of W. F. Reeves, of Marshall, Arkansas, in the foothills of the Ozark Mountains.

Mr. Reeves has found time during his eight years' experience to build up one of the finest and largest herds of milk goats in the country. There is an enormous demand for them because of the strength-giving qualities of their milk. It is so great, in fact, that Mr. Reeves disposes of his animals almost exclusively to parents of weak and sickly babies. He has never advertised, yet he cannot supply one-tenth of the calls that come to him. Most of the inquiries are from references furnished by the United States Department of Agriculture.

There are not many farmers or breeders who will "waste time" with goats, for most of them look on a goat as a "pesky nuisance" and will not have one about the farm. The goat's reputation has gone ahead of him. He is pointed out as the laughingstock and ridiculous joke of animal creation and the scavenger and ragamuffin of the barnyard. But Mr. Reeves did not ask for "a character" when he started raising milk goats. His concern now is to raise enough of them to feed the little bits of humanity whose digestive organs are out of kelter or whose lungs have been touched with the poisoned finger of the White Plague. The babies come first. Then if Mr. Reeves has any extra goats to sell, he finds a ready market with persons suffering poor digestion or those with tubercular tendencies.

W. F. REEVES, Arkansas milk goat breeder, and a pure-bred Toggenburg buck valued at $1,000.

His experience with milk goats has given the Arkansas lawyer a profound respect for the little animal so thoroughly disliked on many hands.

"The milk goat is the cleanest of any domestic animal," remarked Mr. Reeves, apparently mindful of the reputation of goats in general. "They are the healthiest of all domestic animals, too," he added. "They are not subject to the ills, such as pneumonia, that attack sheep and they are more prolific, hardier and cheaper to keep than sheep. A recent government report shows that of the 150,000 animals tested, not one was found to be afflicted with tuberculosis, whereas 20 per cent of cattle are infected with the germ. They are easy to raise, quick to mature and my experience is that they are the most profitable farm animal. They are great 'labor saving devices,' too. A herd will clean up rough brushy land quicker and cheaper and better than the average farm hand. They are good milk producers. My does average five or six quarts a day and there are milk goats with records of 12 quarts, or as much as a good family cow produces."

While Mr. Reeves does not profess to be an authority on the medicinal qualities of goat's milk, he is a close student of all investigations by American and other authorities.

"Some of the most eminent experts say that the milk goat is practically, if not wholly, immune from tuberculosis and that their milk repels tuberculosis germs," he explained. "A great many calls come to me from all parts of the United States for goats for tuberculosis sanitariums. I cannot begin to supply the demand. Most of my experience, however, has been with raising goats for weak babies, especially babies with defective digestive organs. There are not enough milk goats raised in the United States to supply the needy children in the half dozen largest cities, to say nothing of the small places. That is one reason why I have confined most of my sales to people who are trying to save the lives of babies."

Mr. Reeves has no goats for sale now and probably will not have for months if he supplies the calls he already has on file. His herd sometimes gets as low as 100 milk does and these sell readily at $75 and $100 each. He has sold doe kids four or five months old for $25 and the bucks bring $10 to $25 each at weaning time. The registered pure-breds command as much as $200 and some fully grown ones have been sold for $1,000.

"There are not more than 2,000 pure-bred milk goats in the United States today and only eleven imported pure-bred ones are alive," he declares. "Importation was stopped in 1910 by the government and the fine ones consequently are very scarce. There are but three good breeds of milk goats, of which the Toggenburgs, from the valley of that name in Switzerland, are the most numerous. They have been used in Switzerland for hundreds of years. Other breeds are the Saanens and the Nubians."

The common strains of goats are very numerous in the United States, especially in developing regions where there is wild land to be improved. Many farmers in Arkansas, Louisiana and Mississippi use them to clear up underbrush and they multiply rapidly. Good success has been made in these states with the Angora or mohair producing goat, which clips five or six pounds of mohair a year. But Mr. Reeves' experience with milk goats probably will result in a gradual change to this breed of animal.

Photograph selected for THE DEARBORN INDEPENDENT by National Park Service, Department of the Interior.

This is McDermott Lake and the Many Glaciers Hotel, reached by a good automobile road on the eastern side of the park, from the porches of which an inspiring and ever changing panorama is spread before the tourist. Glacier Park is chiefly remarkable for its picturesquely modeled peaks, the unique quality of its mountain masses, its gigantic precipices, and the romantic loveliness of its two hundred and fifty lakes.

America's Master Yegg on Honesty as a Policy

AMERICA'S self-styled master yegg-man, whose conquest of fortune during fifty-seven years netted him nearly three million dollars, now is, at 84 years of age, almost penniless and in jail on a forgery charge. His exploits with the chilled steel drill, nitroglycerin, and a trained nervous system, combined with years of laborious study of his profession, are almost beyond conception. He is the originator of a system of nerve action by which he says no safe in the world can resist his touch more than an hour. And he says he has robbed so many banks that he has lost all idea of the number. But he's done. His profession has been weighed in the balance and found wanting.

The foregoing is the outline of a criminal career, which, Federal authorities say, is one of the most astounding in the history of world criminology. The master yegg-man, said to be the only one in the world whose robberies have made him millions, is Harry Muldoon, recently discharged from the United States penitentiary at Leavenworth, Kansas. As he walked forth from the main entrance a free man he was met twenty feet down the broad walk by a United States marshal, who placed him under arrest on the present charge of forging and raising a United States money order. He will stand trial in Wisconsin for the alleged forgery.

HARRY MULDOON

One who stands before him cannot help feeling his personality; and when he speaks in a quiet, modulated voice one marvels at the misdirected genius. Tall and straight as an Indian, with snow white hair and moustache, he presents a picturesque appearance that might easily confine him to the pages of fiction as some dashing hero of distant years. When he dwells on the fallacies of crime, there is a peculiar appeal in his voice, but at no time is there an indication that he speaks from a point of retribution or an easement of conscience. His reflections are of a reminiscent nature and bear evidence of having been carefully thought out. In view of his demeanor his arraignment of crime carries an argument of such force that it convinces.

The verdict as Muldoon gives it:

"Any man who conceives the idea of gain by theft is an ignoramus and a fool."

Muldoon is humiliated and mortified at the accusation of forgery. He says he has about as much use for a forger or burglar or a swindler as he has for a pickpocket; and that class of men he likes about as well as snakes.

At the close of the Civil War when the nation was glorifying the peace, Muldoon, who had been a dispatch runner for General W. T. Sherman, went to Chicago and there met some friends who gave him his first lesson in the art of breaking open strong boxes.

"After my first trip out," as he puts it, "I was satisfied I would be a tremendous success. That element of daring risk, the spirit of conquest, knowing you were out-thinking some fellow who believed he had his money safe from theft, furnished a spice to existence that made life worth living.

"Then the finer points came. The tickling of the combinations; listening for the fall of the bolts in the door; the loading of a charge, carefully guarding against destruction of the contents on one hand and not having a strong enough charge on the other, were too compelling to resist. You know those were the days before the boys learned to work down their fingers on emery paper to make them sensitive for the detection of the fall of door bolts."

As he recalled the earlier incidents, he smiled broadly. Then he continued:

"I remember once when the boys working with me blew the money all to pieces and blame near blew the building down. But those were the days when we bought our 'soup' already prepared. You know, we had many things to learn. And one of those things was to make our own 'soup.' Ready-made stuff was not uniform in strength. Since then I have made gallons of it."

Asked where he got his finer points of the game, Muldoon rubbed his hands in interest and replied:

"A British robber who had robbed most of the strong boxes in the ancestral homes of the nobility in one district and had gotten very little except mortgages came to America for a more profitable footing. His first job was excellent but a patrolman changed place with his lookout and he came out in the arms of the law.

"I befriended him and spent the proceeds of several good jobs to clear him. We became very friendly and he wanted me to go in for the big stuff. He demanded that I learn the machinist's trade and I told him I had already learned it before I went wrong. This delighted him for he said it would make my instruction much easier.

"We studied together—the mechanism of every make of safe known, how many bolts each had in the door, the weight of the steel, the heft and quality of the steel in the inner door. He, of course, knew all the British makes but he had to freshen up on the American designs.

"Throughout our study I conceived my own system which no other member of the fraternity understood, and which I shall carry to my grave a secret. I can say this much about it. With the use of one drop of acid on a certain place on the safe I can register the fall of the door bolts as easy as the ordinary man can hear a chime clock toll. No sound is detected by the ear. It registers on my nervous system which I intensify through mental effort only when I tackle a difficult job."

Muldoon says his most successful robbery was perpetrated in New York State "about" 40 years ago. He says he and three pals entered a bank and got away with nearly $800,000 and that no one was ever apprehended for the crime.

"After we made this haul," Muldoon recalled, "we tried the climate of Europe. Paris got acquainted with us shortly after and we set the town on fire. Then we visited other European capitals. When our finances gave out or about so, we decided to come home and replenish.

"I settled in Chicago and became a local political power. Many a dollar that I had coaxed out of some stubborn 'Black Lucy' went to help make some alderman, judge or district attorney. And in some cases I helped make the governor."

In the latter years Muldoon says he worked as a locomotive engineer. He said for four years he let the "Black Lucys" alone. Then came the big riot, during Cleveland's administration, in Chicago, and he lost his job. The lure grew on him and he disengaged several thousands of dollars from a small bank "four hundred miles" from Chicago.

"In the Middle Western state," Muldoon said, "I met up with some of my earlier associates and they told me they had been up to a business house trying to crack a famous safe known as the Boston Nutmeg. I began kidding them and they challenged me. I had never been up against the Boston Nutmeg but I told them if they would do the 'outside work' I would bring them out the money in a few minutes. They countered with the proposition that I could have it all if I got in.

"Well, there's no use wasting more time telling about it—I came out in just fifteen minutes with the money in my pocket. They went in and took a look. I kidded them some more and they told me of eight more just like it in that locality. It took me four days to get all of them and then I had a fortune. One thing I rather hated though—the makers had put out a burglar proof guaranty to stand all losses if they were robbed. The company went broke."

Pressed for the approximate number of safes he had opened Muldoon said he could not remember but they were many. After an hour's reminiscences Muldoon told how he arrived at his conclusion that there was nothing in his profession now.

"You see," he began, "you get next to the business and you can't quit. If a man could do one great big job and then retire forever he would be well off, but that's not the history of any business. It's the lure. That's why the business is no good. You are bound to get caught if you keep working and when you are once caught and sent up you have lost your standing of respectability. Then you never can beat back.

"A man just gets it in his blood. When you get the old combination open, get the outer door to fanning the wind, that flaming desire to get at the inner door lures you on. If it wasn't for them a man might quit. It's the fun of setting your charge on the inner door and pushing the outer door shut before the fuse is lit that charms you. Then comes the puff—sometimes a rumble, sometimes a jar—but generally enough to wake some of the home folk up. Then you have another element of risk—the get-away.

"But after a man has had fifty-seven years of it and does eight and one-half years in prison, he comes to know that no matter how smart you are, you are bound to be caught. That's why I am done. I know it's a game you cannot win at. I know that I am smarter than the men who make the safes but I likewise know the law is smarter than myself."

The Oldest Bank Building in America

WITHIN twenty miles of where the first English settlement in America was made at Jamestown is the scene where Captain John Smith records the story of his rescue by Pocahontas, the daughter of the Indian chief, Powhatan. Within a circle of twenty miles is to be found the oldest Protestant church in America; the kitchen where Martha Washington cooked in good colonial style; the college which has graduated three Presidents; Bruton Church, in which more men of historical importance have worshipped than in any other church in America—and Yorktown, where Cornwallis surrendered to Washington.

Although Yorktown has a population of less than two hundred, it has two banks, both of which are working in what are probably the two oldest buildings used for banks in America. One of these banks, operating under state and trust company laws, is housed in the historic oldest custom house built in America—erected in 1715. Here the ships for Philadelphia were once compelled to enter and clear. Here at one time was the gathering place of the financiers of the early colonists. Wall Street has taken away the financiers but has left the same old building with its same old walls of English brick, some twenty-four by forty feet square and two stories high.

Today the cashier welcomes the visitor with true Virginia hospitality. There is no rush—nobody hurries in Yorktown. Everyone has all day tomorrow not yet touched.

Friendliness and hospitality are more important in Yorktown and Virginia than profits—except when some outside profiteer has entered upon his field of work in Virginia. The average Virginian thinks more of the past than of the future and more of friendship than of profits. The modern automobile is doing more to change the Virginian from his good old easy-going ways than anything that ever came to America.

Just across the street from the old custom building is another building housing the work of the First National Bank of Yorktown. The town and surrounding country are so prosperous that there seems plenty of business for two banks. The building appears more quaint and ancient than even the custom house building erected in 1715.

Both of the buildings are priceless souvenirs of a past age and time of colonial glory. To change the outlines of either would seem like sacrilege and disloyalty to the Colonial Fathers. It is well that they are used as banking institutions until such time as wealthy lovers of history shall buy them and donate them for preservation to some historical society.

Above: The First Custom House in America. It was built in 1715. Here the ships to and from Philadelphia once entered. It was old when Cornwallis surrendered his army and the Declaration of Independence became independence in fact.

Below: The First National Bank, of Yorktown, Virginia. It is one of the many preserved buildings of colonial days still to be found in Virginia. The old brick walls bear witness to its age and its quaint architecture is pleasing as a study in colonial work.

Jew Versus Non-Jew in New York Finance

The Struggle for Jewish Supremacy in the American Financial World; The Silent Resistance of the Gentile Coalition in Wall St.

THE Jewish problem in the United States is essentially a city problem. It is characteristic of the Jew to gather in numbers, not where land is open nor where raw materials are found, but where the greatest number of people abide. This is a noteworthy fact when considered alongside the Jews' claim that the Gentiles have ostracized them; the Jews congregate in their greatest numbers in those places and among those people where they complain they are least wanted. The explanation most frequently given is this: the genius of the Jew is to live off people; not off land, nor off the production of commodities from raw material, but off people. Let other people till the soil; the Jew, if he can, will live off the tiller. Let other people toil at trades and manufacture; the Jew will exploit the fruits of their work. That is his peculiar genius. If this genius be described as parasitic, the term would seem to be justified by a certain fitness.

In no other city of the United States can the Jewish Problem be studied with greater profit than in the city of New York. There are more Jews in New York than in all Palestine. The communal register of the Jewish Kehillah (or Kahal) of New York sets the population at about 1,527,778. "The next largest Jewish community in the world, that of the city of Warsaw, is estimated to have been between 300,000 and 330,000 Jews, about one-fifth as many as we estimate for New York." (Communal Register, 1917-1918.) "If we accept the estimate of the number of Jews in the world as about 14,000,000, one Jew out of every ten resides in New York."

As a population, the Jews exert more power in New York than they have ever exerted during the Christian Era in any place, with the exception of the present Russia. The Jewish Revolution in Russia was manned from New York. The present Jewish government of Russia was transported almost as a unit from the Lower East Side of New York. The New York Ghetto has long since overflowed the lower East Side. Brownsville, Brooklyn, is a Jewish town, with its own language, theaters and press. The upper East Side of New York is practically in large sections a Jewish ghetto. The prosperous West Side and the middle class section of the city north of Central Park are practically Jewish.

The Center of American Jewry

WITH the exception of one great department store and a few lesser ones, all the large department stores in New York are Jewish. Men and women's ready-to-wear apparel, laundries, furriers, the general run of shopkeeping is practically monopolized by Jews. The legal profession is predominantly Jewish. It is estimated that of the 27,000 news stands that control the distribution of New York's reading matter, 25,000 are in the hands of Jews. There are 360 synagogues on the East Side of New York alone.

The New York Kehillah is a very powerful organization, whose membership strength is not accurately known. It may be described as the Jewish government of that city. It was organized in 1908 as the result of a statement by General Bingham, then police commissioner of New York, that the Jewish population, which then amounted to 600,000, contributed 50 per cent of the criminals of the city. The Kehillah is the bar before which the authorities must answer for statements or acts touching the Jewish community. Its power is very great and its methods far reaching.

Politically, while the rest of the country is entertained with the fiction that Tammany Hall rules the politics of New York, the fact is rarely published that the Jews rule Tammany.

But it is not the possession of power that constitutes an indictment of any people; it is their use or misuse of it. And if the fact of power is established, no misuse of it being found, the fact has a commendatory side. If the Jews who flock to New York become American, and if they do not work ceaselessly to twist Americanism into something else; if they strengthen the principles and traditions of America, and do not cease to vitiate the one and abolish the other, the judgment upon them must be one of friendship.

However, to establish the fact of Jewish power, one need not remain in the ghetto nor in the mercantile districts. There are higher fields awaiting survey.

In Wall Street, the Jewish element is both numerous and powerful, as might be expected of a race which from early days has played an important part in the financial operations of the world.

This is not to say, however, that Jewish influence in American financial affairs is paramount. At one time it threatened to be, but American financiers have always been silently aware of the International Jewish Financier, and have endeavored quietly to block his game. Time and again the contest has seemed to turn in favor of the Jew, but when the widespread secret wrestlings of the two powers have been suspended for a moment, it has been found that American finance has maintained its superiority, if only in a slight degree. The Rothschilds were the first to be beaten on American soil; the story of their hidden hand in American finance, politics and diplomacy is a voluminous one; but even their finesse did not avail against the sterling worth of American Business—not "American business" as it has come to be known now that thousands of Jews are scattered about the world, representing themselves to be "American business men" although they can scarcely speak English!—but American Business as represented by the combination of American ability and American conscience. If the reputation of American business has suffered, it is because something other than American methods have been used under the American name.

Character of American Finance

IN THE New York financial district, Jewish finance makes itself felt through its private banking institutions. As distinct from the great trust companies and banks of deposit, the private banker utilizes his own capital and that of his partners and associates.

Jewish finance differs radically from non-Jewish finance in the fact that Jewish bankers are essentially money-lenders. They may underwrite great flotations of bond and stock issues for railroad and industrial companies, governments and municipalities, but these securities are immediately sold to the public. There is a quick money turnover. The public carries the bonds; the Jewish financier gets his money. The Jewish banker himself rarely has a permanent interest in the corporations he finances. Non-Jewish bankers usually feel obligated to retain a connection with the enterprises they have financed, in order to assure the investors a proper administration of funds; they feel obligated to contribute to the success of the investments which they handle for other people.

The Jewish banker keeps his capital liquid. The cash is always in his coffers. This is essential to his position as one who deals in money. And when the inevitable day of financial stress arrives, he profits greatly by the higher value then placed on liquid capital.

Far and away the leading Jewish banking house in Wall Street is that of Kuhn, Loeb & Company. The head of this great firm was the late Jacob Schiff, whose associates were his son Mortimer, Otto H. Kahn, Paul M. Warburg, and others, who have taken prominent parts both in public life and giant financial operations. Other private Jewish banking houses may be named as follows: Speyer & Company, J. and W. Seligman & Company, Lazard Freres, Ladenburg, Thalmann & Company, Hallgarten & Company, Knauth, Nachod & Kuhne, Goldman, Sachs & Company, as well as others of relatively less prominence. These firms enjoy a high reputation for financial integrity. They are cautious bankers, skillful in their operations, and sometimes brilliant in their financial strategy.

There is much control of industry, from the financial side, represented by Jewish power in Wall Street, and they have gained a monopoly of many metal markets. Large, prosperous Jewish brokerage houses are on every hand. The further one goes down the line of speculative operations, the more of the Jewish race one finds to be active in the work of company promotions and the marketing of oil and mining stocks.

No Jewish Bank President in Wall St.

YET one amazing fact stands out from the mass: there is not, at this writing, a Jewish bank president on Wall Street; that is, a president of a bank of public deposit. Of all the great banks of public deposit and corporation finance, the enormous trust companies whose individual resources often run up to $400,000,000 and whose combined resources approximate many billions, not one of them has Jewish management or Jewish officers.

Why is this so? Why have the powerful banking families of Wall Street surrounded themselves so carefully with non-Jewish associates? Why has this great dividing line been drawn between members of the Jewish and non-Jewish races in the financial district that manages the financial resources of the nation?

Why? The answer to the question is in the custody of the stronger and sounder financial heads of Wall Street.

Only here and there will one discover a Jewish director in the boards of some of the lesser banking institutions.

The situation may be due merely to a shrewd analysis of the public mind. Rightly or wrongly the public prefers not to confide its money to an institution under Jewish control. It is true that in certain uptown sections of New York there are a few banks of a local character which are completely under Jewish management. But even the Jews prefer to deposit their money in banks which are free of Jewish control.

The situation may also be the effect of the unfortunate experience which the public has had with Jewish management of banks in the past. Several large failures have served to impress upon the public mind a certain peculiarity which attached to the Jewish element in those failures. The public has not forgotten, among others, the failure of Joseph G. Robin, whose real name was Robonovitch. He was an Odessa Jew. In an incredibly short space of time he built up four large banking institutions in which public money was deposited. He wrecked them all. His failure was most sensational and caused untold suffering. Robonovitch's career illustrated very vividly the extent of the gifts and energies of the Jew from Russia, his wonderful faculty for building up large concerns through chicanery, and his cowardice and duplicity in the hour of defeat. This banking career ended in a felon's cell.

However, one fact of importance, a fact that should be reassuring to the general public, is that the men to whom is entrusted the crucial task of putting to work and keeping at work the financial resources of the United States have hedged themselves about with a non-Jewish wall of great strength and long standing.

Jews Fight for Power on Exchange

THE effort of Jewish interests to gain control of the Stock Exchange is also an interesting story, and although the record shows a steady Jewish gain toward the end they desire, it is slow; but there are indications that the relentless persistence for which the Jew is noted, will prevail in the end—that is, if stock gambling continues to prove an alluring source of wealth.

When the Jews gain control of the Stock Exchange they will, for the first time, possess the power to wrest public banking control from the non-Jewish group.

There is a silent resistance to Jews on the Stock Exchange also, in virtue of an unwritten law, just as there is in the banking world of Wall Street, and the story of the counter-resistance calls for an historian.

It is related by Sereno S. Pratt that in 1792 there was a little office at No. 22 Wall Street for the public sale of stocks. A number of men, engaged in the business of buying and selling, were accustomed to meet near a large buttonwood tree which stood near 68 Wall Street. In 1817, the New York Stock Exchange, about as present constituted, was organized.

The Stock Exchange is a private institution. It is practically a commission club in private hands. It is not incorporated.

Its membership is strictly limited to 1,100 men.

There are only two ways by which an outsider can become owner of a seat on the Exchange—by obtaining it from the executor of a deceased member, or by purchasing from a retiring or bankrupt member.

These memberships or seats cost at present more than $100,000. About ten years ago a seat could be bought for $77,000.

The Stock Exchange is ruled by a Governing Committee of 40 members. For many years no Jew was elected to this Committee. Of recent years, an occasional Jewish broker has succeeded in being admitted to this upper group, but not often. This position, however, has not been the main objective of Jewish traders. When they secure a sufficient number of seats on the Exchange, they will take care of the matter of control in their own well-known way.

The two barriers which at present operate to prevent a large inroad of Jews are these: first, a silent resistance on the part of the other members against the admission of Jews, a resistance which is said to date from the earliest formation of this famous trading institution. And, second, the restrictions which are placed by the constitution of the Stock Exchange itself on all applications for membership.

The Governing Committee of 40 has a Committee on Admissions which comprises 15 members and which considers all applications for membership. As the membership is fixed at 1,100 and as no new seats are ever sold, a new member can gain entrance only through the transfer of an existing seat. But even such a transfer is under the strict control of the Committee on Admissions, to whose scrutiny the name of the applicant must be submitted, and whose two-thirds approval is necessary to his being seated.

But one outstanding characteristic of the Jewish race is its persistence. What it cannot attain this generation, it will attain next. Defeat it today, it does not remain defeated; its conquerors die, but Jewry goes on, never forgiving, never forgetting, never deviating

from its ancient aim of world control in one form or another. So, though it would seem impossible that Jewish membership in the Stock Exchange could increase under these conditions, the plain fact is that it has increased. Slowly but surely the Jews are gaining numerical power on the floor of the Exchange. And they are doing it with a subtlety that is amazing.

How do they do it? In the first place, no Jewish member ever transfers his seat to a non-Jew. In times of market dullness, when the prices of seats drop, and the demand is not so keen as usual, Jewish bidders offer, invariably, the highest sums to the seller. Then, in the case of the bankruptcy of a non-Jewish member, the receiver is almost compelled by the demand of creditors to accept the highest bid for the transfer of his membership; and, of course, a Jew is always at hand to make the bid as high as necessary. These are the two principal methods by which Jewish membership in the Exchange is being increased.

Changing Names to Cover Nationality

ANOTHER method, however, is more insidious than all the others combined. It is based on the rather common practice of adopting non-Jewish names or professing some phase of the Christian faith. The "changed name," or, as Jews know it, "the cover name," is a very potent part of the policy of concealment. In an advertisement, on business stationery, at the head of a magazine or newspaper article, such names as Smith, Adams, Robin, serve as a "blind." The stage is flooded with Jewish actors and actresses, but their names are very distinguished Anglo-Saxon. Jewish papers often print jokes based on this habit of changing names. For long-distance dealing, or any business that is carried on "unsight and unseen," the name-veil is very useful. On this account, many Gentiles would be surprised to learn the extent to which they are involved with Jews, whose names give no indication of Jewishness. And this very system, an old American name, coupled with membership in some Christian sect (preferably one of the newer sects), has accounted for some memberships in the Stock Exchange which probably would not otherwise exist.

It is interesting to tabulate the growth of Jewish membership as shown by the old directories of the Exchange.

In the year 1872, with a total of 1,009 members, there were 60 Jews.

In 1873, with a total of 1,006 members, the Jewish membership decreased to 49.

In 1890, with membership limited to 1,100, there were 87 Jews.

In 1893, with the same limit of membership, there were 106 Jews.

At the present time, still with the same rigid limitation of membership, there are 276 Jewish members.

It is said that the Jewish membership is really somewhat larger than the last figures indicate, owing to the fact that some of the Jewish members bear non-Jewish names and have adopted some phase of the Christian faith and have cut themselves off, outwardly at least, from the Jewish community.

The figures show, therefore, that Jewish membership increased from 5⅞ per cent of the total in 1872 to 25 per cent in 1919.

In its reference to the Stock Exchange under the head of "Finance," the Jewish Encyclopedia states that Jewish membership is "only 128," "a little more than 10 per cent." The date of these Jewish statistics is not given. The article quoted has, however, an argumentative as well as informative purpose. The statement concerning the 10 per cent membership on the Exchange is made to call attention to the fact that "Jews form at least 20 per cent of the whole population of New York, and much more than that percentage of the business section." The Jewish population of New York City has since increased to 25 per cent of the whole, and the membership on the Stock Exchange has increased to the same point.

But it has taken 47 years for the Jews to gain that 25 per cent membership. Their control of the Exchange, at the given rate of progress, is only a question of time.

In spite of these details, it is probably a fact that the Jewish speculators in the New York financial district greatly outnumber the non-Jewish speculators. Speculation and gambling are known historically as special propensities of the Jewish race. While many Jews patronize non-Jewish firms, the great mass of them follow in the speculative path of the leaders of their race. In Europe, where their financial control is more firmly fixed and of longer standing than here, it is rarely that the Jews are caught in speculative failure. They are sometimes found in speculative scandals, but seldom in any scandal involving losses to themselves. As a rule they dabble in "Jewish" securities, and in Wall Street one hears many stories concerning the victories or defeats of "the Jewish following."

Some of the biggest Jewish sensations which ever occurred in the United States, sensations which disclosed by their lurid light the interlocking of Jewish finance, politics and racial objectives, have been brought to light by occurrences in Wall Street. It is probably the nature of these disclosures which accounts for the strong and silent anti-Jewish resistance which characterizes straight American finance.

Meanwhile, to leave the exalted sphere of Wall Street, banking and brokerage activities, let us descend to the street level of the Curb Market in Broad Street. Here the Jewish brokers flourish in their oil, mining and stock promotion offices. They are so numerous as to give a Semitic cast to the vicinity, as if it were a quarter in a foreign city. It is true that these concerns are frequently operated under non-Jewish names, but that is merely part of the Jew's consciousness that, in financial matters, whether rightly or wrongly, he is under suspicion. Gentile names carry with them no such handicap.

The "Sucker List" of Gentiles

GOING still further down the line, in shadier lanes, in semi-hidden offices, may be seen numerous members of the Jewish race who are identified with no established market which deals in securities. These are the true parasites of the Wall Street environment, they are the camp followers without status. Their work is that of fraudulent stock promotion, and they enter upon it with a zeal and an energy which nothing can dismay. Their purpose is to make money without labor, to get money without giving value, and in this they are immensely successful. It is amazing the number of these men who make immense fortunes; it is equally amazing the continuous crop of unwary, poorly informed, and unsuspecting Gentiles who send their money from all parts of the United States for the worthless bits of paper in which these Jewish parasites deal. It is a most heartless business; it has not even brilliance in its deviltry. It is the old-time shell game in other terms. The operations of these men are mostly conducted by mail or telephone. They deal in "sucker lists," and they circulate "market letters" by which, under the pretense of giving disinterested advice to investors, they seek to boom their own shady game. These "market letters" are, of course, innocuous to those who are informed and who can read their fraudulent import between the lines, but they are dangerous to the honest but uninformed minds of tens of thousands of thrifty people.

Pursued by detective agencies, watched constantly by the government secret service, exposed by the newspapers, placed on trial in the courts, convicted and sentenced to terms in prison, this type of Jewish swindler is undeterred. Where other men would regard exposure as a lifelong shame, this type regards it simply as a trifling interruption, as a sailor would regard an accidental tumble overboard.

The Lower Orders of Parasites

THERE are lower depths still, where bald theft and violence prevail. The persons most found there are the henchmen of the lower type of speculators. The stories of criminality in Wall Street, a numerous and startling list, involving sometimes the high, but mostly the low, and all marked with a peculiar racial and groupal cast, have at times challenged the attention of the whole world, but as is usually the case with the general publication of such stories, the fundamental explanatory facts are omitted.

But it will be seen, as the story of actual conditions in Wall Street and its financial environs is unrolled, that there are always the two elements—Jewish and non-Jewish. It is perhaps the only non-Jewish coalition in America, this silent resistance which American finance is making to Semitic control. It is, in a sense, unnatural to the American mind, but has been forced as a defensive against the strong offensive operations of the Semitic coalition. If there is ever in the United States a strong non-Jewish combination, it will be the direct result of the ancient Jewish coalition against non-Jews. The condition in the United States at this moment, with regard to the financial question, is this: The Jewish coalition goes lower, but it does not yet go higher than non-Jewish control. It is struggling to go higher, but has thus far been estopped. It is believed that when the people are made aware of what is transpiring, it will be forever estopped.

As readers of former articles will remember, the attack upon Capital represented by the disorderly forces who operate under the forged banner of "Progress," is an attack against Gentile capital only. The only financial managers attacked in the United States are Gentile managers. In England also, the same attack is made. Readers of the newspapers know what strenuous efforts are being made in that country to wreck railroad and coal mine administration by a constant series of strikes. But what readers of newspapers are not told is that the railroad and coal mines are still in Gentile hands, and that the Bolshevist-led strike is a Jewish financial weapon to wreck these forms of Gentile business, that they may easily fall into Jewish hands.

A book containing over 200 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Commenting on the fact that Alexandre Millerand, the new president of the French Republic, has "frequently been the subject of anti-Semitic attack," the *Libre Parole*, of Paris, constantly referring to him as "M. Millerand-Cahen," a Jewish journal proudly asserts: "M. Millerand has never concealed his origin and has always shown the warmest sympathy toward our co-religionists." President Millerand's mother is a Jewess, Melanie Cahen by name, from an old but decayed Jewish family of Paris. His wife is also a Jewess.

Oscar Heiler, former American Consul General at Constantinople, has been appointed American Consul at Jerusalem.

"Read the history of Plymouth Colony by Bradford, peruse the sermons of Robinson, delve into the thought of Brewster, and the indebtedness of those leaders in the Pilgrim movement to the writers of the Old Testament stands out clear and indubitable. The theocracy of ancient Israel was reproduced in the theocracy of the Pilgrim Fathers." Rabbi David Philipson at International Fellowship meeting, Boston, in celebration of the Tercentenary of the Landing of the Pilgrim Fathers.

The first Jewish Constituent Assembly of Palestine was convened in Jerusalem on October 7. Women delegates were seated over the protests of the orthodox Jews. Although the labor element is in the majority, no ultra radical legislation is likely, the capitalist group having the assembly well in hand.

Felix M. Warburg has returned from abroad. The cables reported him as being opposed to further immigration of Jews into the United States. This he indignantly denies as a "malicious slander." The immigration of Jews, along with other mysterious developments, is noticed in the direction of the Argentine. France is also complaining about the great numbers that are thronging to Paris.

Vienna reports that the Galician general Galeski has ordered an investigation of the Zionists, especially the organization called "Hashimur" which gives Jewish youths military training.

Soviet Russia is much interested in Hebrew literature, has issued ten volumes of the Hebrew classics and a number of Hebrew textbooks from the government printing press at Charkow.

A protective bill has been introduced in the Hungarian lower house prohibiting the ownership of newspapers and theaters by Jews, and limiting their real estate ownership to one house.

The Kovno correspondent of *Glos Narodu*, a Warsaw paper, declares that Colonel Ward, the British consul at that place, while ostensibly caring for British interests is in reality a Jewish representative and much more concerned with Jewish than with British interests, to which work his office is almost exclusively devoted. Ward is a pronounced Zionist and very friendly with the Jews.

Szcmon Askenazy, who is a Jew and also the Polish Plenipotentiary to the Court of St. James, has this to say about the Peace Conference's shackling of Poland: "I declare my conviction as a good Pole and a good Jew, that this Statute—the gift of honest and well-intentioned men—was a disaster alike to Jew and Pole." As to reports of the terrible condition of the Jews in Poland, and reports that anti-Semitism was rife in that country, he said: "Both kinds of reports are false."

The reports of Henry Morgenthau, Brigadier General Jadwin, Sir Stuart Samuel, Captain P. Wright and Sir H. Rumbold, on the Jewish problem in Poland have been published in full in a pamphlet issued by the National Polish Committee of America, 1214 North Ashland avenue, Chicago.

According to Louis Marshall, in a reminiscent article in the Jewish press, the late Jacob Schiff once refused to shake hands with President Taft. Mr. Schiff desired the President to break off relations with Russia over the Jewish passport question. Mr. Taft refused. Thereupon Mr. Schiff left the White House without the usual courtesies, saying to Mr. Marshall: "This is the commencement of a campaign which we must win," and offering to supply all the money necessary. The Jews did win; and the United States did sever the Russo-American commercial treaty.

Richard Korish, the Jewish lord mayor of Wexford, Ireland, was arrested by the English authorities

Two men, named Levy and Samuel, were arrested by the French authorities upon their arrival at Paris from Constantinople. The sum of 72,000,000 rubles was found in their trunks.

What One Must Do to Obtain a Patent

By EMMETT C. HALL

THE average American starts inventing things about the age of ten, when he "thinks up" a "little jigger" consisting mostly of a bacon rind, which will more or less automatically grease the bucksaw, or a "contraption" to keep the cow from switching him in the face with her tail while he milks, or a "do-funny" of blotting paper to permit him, after all, to carry his Christmas fountain pen without drowning himself in ink, or something of equal interest and, to him, importance. Later on he will mentally construct or make or compound all sorts of devices, ranging from a better can-opener to a typewriter ribbon that carries its ink like a lamp wick carries oil, and sometimes he will even make a model, or try his process out. For a day or two he will be much excited about it and think he has a fortune in his grasp, and then either find that the thing has been on sale at the ten-cent store for years, or wear out his enthusiasm talking about it and finally let the idea die from neglect. In the vast majority of cases it doesn't make much difference, for the idea probably isn't new, even though he has never seen such a device in operation but, unquestionably, once in a while some one lets a fortune slip through his fingers in this way.

There is not one chance in a million that if you deliberately sat down with the determination to think of something new that you would succeed in producing anything that had not been familiar in a similar if not identical form for many years, but the thing which is the inspiration of a moment of need, mentally created to fill an actually experienced want, whether serious or trivial, *may* be new, and if so, the possible reward is too great to chance losing it. It is almost a certainty that if you have invented some useful, practical thing, no matter how small, insignificant and simple, or even an amusing novelty of no practical value except that it really *does* amuse, you will if you act wisely make a great deal of money from it. And it may be remarked right here that the small, simple, inexpensive utility is much more apt to make money for the inventor than many far more important discoveries. Games of a mechanical nature and popular appeal are almost certain money-makers.

The first thing to do, of course, is to find out if your invention is new, useful and practical. It may be possessed of two of these three qualities and, lacking the third, be worthless. For instance, it might be new and useful, but not practical by reason of its expensiveness. Discreet inquiries among those who might know of such a thing, if it existed, will determine whether it is familiar to others even though it might not have been to you.

Any person is at liberty to inspect United States patents, but it is not convenient to the average person to do so, and even if one chanced to be in Washington, an untrained searcher would make poor progress, and the services of a patent attorney should be enlisted. It is not necessary to employ a patent attorney to secure a patent, but the Patent Office itself advises the employment of one. To the average inventor it means a saving of a little money at the very beginning, if the patent is not allowed, and may mean the difference between a valuable and a worthless patent, irrespective of the merit of the invention. As all the records of the Patent Office are at Washington, and it is there that arrangements must be made, it saves time and a roundabout method to employ one of the firms located at the capital. Most of the larger firms will, without charge or the placing of the inventor under any obligation, report as to whether, in their opinion, an invention is of a class to entitle it to patent protection, *if new*. This opinion does not deal with the question of newness. If the report is that the invention does not come under any one of the classes to which patent protection is extended, there is nothing to do but drop the matter. Under the law a patent may be granted for any new and useful process; machine, article of manufacture, composition of matter, novel design. A "process" is a means used to accomplish some result, and the newness is to exist in the means, not the result—as, for instance, a patent could be obtained upon a new means of applying the material to the backing to make linoleum. A "machine" is any mechanical construction which *does* something, as a steam engine, a typewriter, a phonograph, or a telephone. A phonograph record, or a new sort of key for the typewriter, for instance, would be an article of manufacture. "Composition of matter" embraces most chemical compounds, "patent medicines," metal alloys, the preparation of the materials for match-heads, but not the method by which the material is applied to the stick, and so on.

If the invention is reported by the attorney as apparently patentable, a "special search" should be ordered, to determine whether or not the invention appears to be new. This means examining all the patents that have been issued of classes analogous to your invention. The attorney will report whether the invention seems to be new and whether, in his opinion, a patent might be obtained. The attorney does not, of course, guarantee that a patent will be issued, even if the invention seems new, but long familiarity with the practices of the Patent Office enables him to judge with considerable accuracy what its action will be on a specific application. For this service most of the attorneys charge but a nominal fee, usually $5, and the service is well worth this amount. If the report after search is unfavorable, the inventor can drop the matter, and be out only the $5. If the report is favorable, he can go ahead with renewed hope. If no attorney is employed, there is no way (other than personal search) to determine what are the prospects of a patent being allowed except to make formal application, and this requires the payment of a fee of $15. If the claim is rejected, this fee is lost.

Assuming a favorable report by the attorney, the next step is the formal filing of the application for patent. This is a highly important step, and the one in which the attorney is most valuable. A patent protects an invention only in so far as it is described in the specifications filed with the application for patent—this has been the invariable attitude of the courts in patent litigation. The drawing of the specifications, therefore, is of vital importance, for all possible claims must be asserted therein, no future additions or amendments being permitted. Instances are not uncommon wherein inventors have failed to so describe their inventions as to gain full protection, so that with trifling changes in details the devices have been put on the market by others, to the ruin of the original inventors. "A patent," merely, may be of no real value if its limitations are too great, and here is found the difference between a good and a poor patent attorney. The poor attorney may not grasp the basic idea of the invention, but content himself with protecting petty details, or he may be too lazy or indifferent to his client's interests, after having received his own fee, to "fight it out" with the Patent Office. The good attorney will see to it that the specifications are the broadest possible, and will make every effort to have the patent allowed as claimed. Just how an inventor is to be able to distinguish the sheep from the goats is a problem, of course. Unless one has personal knowledge in the matter, the only thing to do is to pick out the firm of best general reputation. The application papers are sent to the inventor for signature, and if the claims made therein do not seem to him broad enough, he should ask why, and insist that they be made so if no good reason to the contrary is forthcoming.

If the invention is so simple that it can be described with unmistakable clearness, an attorney is perhaps not needed, after the search of the existing patents, but few inventions worth bothering about are of this class. The applicant for a patent is required by law not only to describe his invention fully, but particularly to point out and distinctly claim the part, improvement or combination which he claims as his invention or discovery. The rules and forms of the Patent Office are exact and rigid, and must be fully complied with. They are fully set forth in the "Rules of Practice in the United States Patent Office," a book which will be sent free of charge if a request is made to the Commissioner of Patents. This book also contains specimen specifications. All necessary blank forms will also be supplied without charge by the Patent Office.

The total government fees for a patent amount to $35, $15 being paid when application is made, and $20 within six months after the allowance of the patent. Attorney's fees are usually about $30, with an additional charge of $5 for drawings. It is, of course, advisable to have a distinct understanding in advance as to how much the attorney proposes to charge for his services.

In the matter of time elapsing before a patent may be granted, no one attorney is better than any other, nor can any attorney hasten the process in any way. All applications are examined and passed upon in the order in which they are received, with absolute impartiality, and an application by Edison receives no more consideration than one by John Smith. An inventor should never, under any circumstances, endeavor to exert political influence, as it would be worse than useless. The time required to pass upon an application may vary anywhere from a few days to a year, according to the nature of the invention and the class in which it belongs—some class-divisions of the Patent Office are well up with their work, while others are far behind.

Patents are not granted upon any device, process or composition of matter which is intended for use in a manner or for a purpose contrary to law, as gambling equipment or food adulterations, and no application for a patent upon a perpetual motion machine will be received, unless accompanied by a working model which will actually work. Needless to say, there have been no patents issued on machines of this class. Use of an invention, by the public or in public, for two years, bars it from patent. Merely to "think of" a thing is not inventing it in the full sense, and if someone else, even afterward, gets the same idea and applies for a patent, he will be held to be the true inventor.

That Texas Turkey Trot

"WHERE do all the turkeys come from? Seems as if everyone had a turkey at Thanksgiving—where do they grow?"

Such a question is asked by many a small member of any family living in an ordinary American small town. They have seen turkeys, probably some farmer beyond the town has a flock of six or eight, but never enough to make clear why at two holidays, Thanksgiving and Christmas, they are so plentiful that almost every family can boast of one. Chickens and ducks they know to be common, but where do the turkeys come from?

And a remarkable point is the fact that not any of the members of the average dinner table can correctly answer his question.

"Oh — from the farmers," says Uncle George. But what farmers?

There are portions of the United States were turkey-raising is the chief industry. It is true that turkeys can be found in almost every vicinity, but they are not numerous. The farmers in the eastern states bordering on Canada have gone in for turkey-raising lately, but the big turkey state is still Texas. And, in spite of the fact that hundreds of thousands of pounds of the luscious meat are sold each year for "fancy prices," turkey-raising is on the decline today.

There are several reasons for this. To begin with, turkeys are the hardest fowl to keep alive, the mortality being extremely high, and secondly, in the great grain districts, turkeys are found to be disastrous. They range through the fields and damage the crops to some degree, which is naturally not conducive to good neighborliness. Of the six varieties popular in this country the Bronze is probably the best, the hardiest, and the heaviest. Four weeks are required for hatching and about fifty per cent of the brood lives to feather. Exposure to dampness, a sudden cold night, close confinement, improper feeding, can all be blamed for the loss of life. However, if the amount of time necessary for their care can be given the young turkeys, they can be raised.

Driving the holiday turkeys to market.

As soon as the poults are old enough they are placed on the range, where they look after their own feeding, rustling for grasshoppers and other insects, green vegetation of almost every kind, and such nuts as chestnuts, acorns, and so on. They need a large range, since close confinement is found to be one of the reasons for losses with these birds. Turkeys are fattened for the market about the first of October, the quantity of food being increased from day to day until generous measures of wheat, oats and corn are given as well as the food they pick up on the ranges. In Texas, most of the turkeys are fattened on nuts, acorns being a favorite food. The marketing season starts about the middle of November, that is, for Thanksgiving, and is fairly brisk until the latter part of December, which takes in the demand for Christmas, and also for New Year's. The farmers who have small flocks and sell to the towns near by generally get their orders direct, but the turkeys for the larger towns and cities that come to the family table by way of the butcher shops are killed, dressed, packed in refrigerator cars, and shipped away to their destinations.

Cuero, Texas, is probably the largest turkey center in the United States. It is in this town that occurs the famous annual "turkey trot," when thousands of turkeys are driven in to the town from the surrounding country. It is a day of festival, for turkey-raising is the chief industry, and on the day they sell their flocks, the men and women of the neighborhood receive credit which will be their chief means of support for the following year. And many of them, those who raise hardy birds and devote their time exclusively to the industry, grow rich in their endeavors. Cuero boasts slaughterhouses and dressing plants, also excellent railroad facilities.

So, when you sit down to your Thanksgiving dinner you will know your turkey probably came from Texas.

Spirit of New West in Denver's Civic Center

By LILLIE GILLILAND McDOWELL

A RECENT movement in a southern city, looking toward the planting of trees on its streets in honor of the great writers of the South, attracted widespread attention. Denver's Colonnade of Civic Benefactors, as evidenced by its name, will honor Denver citizenry, thus it is a hall of fame unique and distinctive. The names of all Denver citizens, living or dead, who have helped substantially toward the beautification or cultural development of the city, are to be carved upon its columns. The board which will determine the names to be thus inscribed is composed of Denver citizens. The colonnade, which with the theater forms the arc of a circle, is appropriately built of Colorado gray sandstone, in keeping with the other buildings which make up the Center.

The outstanding feature of the Greek theater, which is a community theater, all its entertainments being free to the public, is the big glass curtain which is lowered at the back of the stage when the theater is in use. This curtain permits the audience to look through the stage upon the street at its rear, and also serves as a sound deflector. Thus the acoustic properties of the stage are unexcelled. When not in use the curtain is raised by machinery into archways of the colonnade, the machinery operating from a basement room. This arch is copied after the proscenium arch in Denver's great auditorium, making the structure of the colonnade the most unique in the country.

Denver's Civic Center is a part of a great plan originated by Mayor Robert W. Speer, now deceased, who was one of the foremost authorities on municipal government in the world. The plan embraced the improvement and extension of parks, boulevards and playgrounds and the building of the Civic Center, the latter to form the nucleus of the whole park and boulevard system. It was so planned as to supplement and connect the work already carried out; and was so far-reaching in its scope as to make the need for further acquisition of lands unlikely in this present generation.

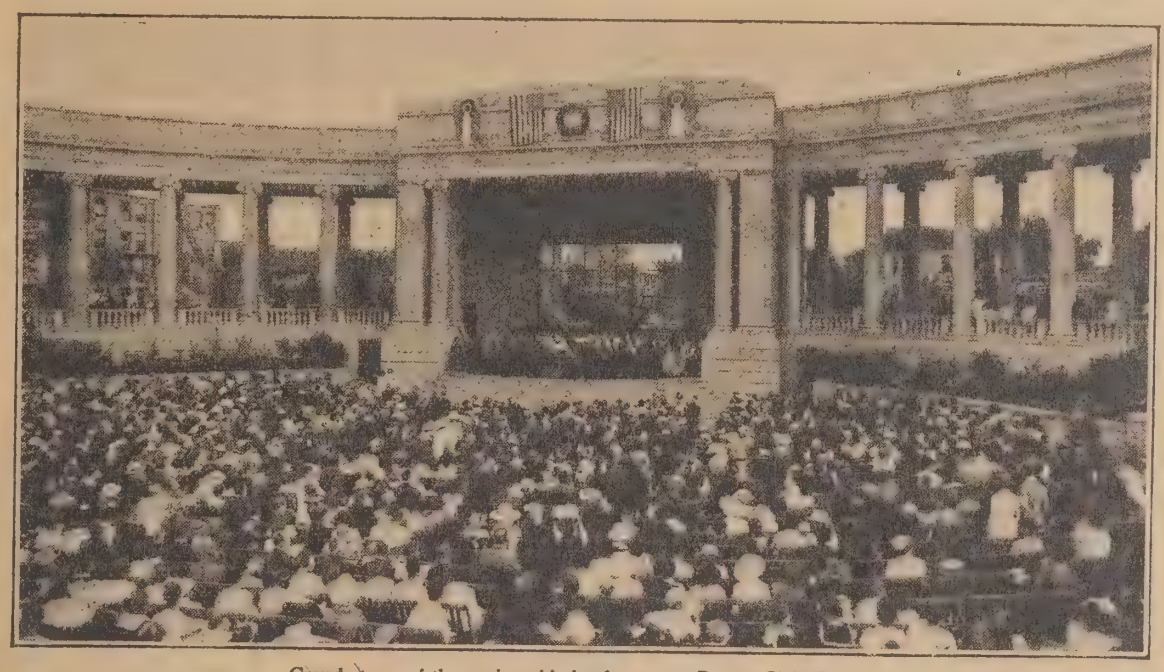
When the Civic Center project was launched, Denver had 29 parks, with a total acreage of 1,984. The city now has 37 parks, including 18 supervised children's playgrounds. There are 18 miles of improved parkways.

The Civic Center plans embrace the aggregation of public buildings in a central location. The state capitol building formed the logical nucleus for this. Its site, on the brow of Capitol Hill, commands an unexcelled view of the Rockies. It is built entirely of Colorado granite, at a cost of $2,800,000, and is flanked on the south by a handsome state museum building. Its grounds are beautiful, with trees and statuary, the latter embodying the spirit of the West. Four blocks immediately flanking these grounds on the west are converted into a plaza, which, with its buildings, forms the Civic Center.

The most commendable feature of the Civic Center project is perhaps the caution and slowness with which it has been pushed forward since its inception more than 15 years ago. Mayor Speer, after the project was well on foot, took advantage of a brief period during which the commission form of government prevailed in Denver, thus deposing him as mayor, and visited some of the great cities of Europe and other countries, making a careful study of their plazas and civic centers. He noted that some of these had taken thousands of years for their completion from the time of their inception, and resolved to emulate in a degree this example in so far as practicable in a bustling, hustling city of the West, and although several cities of the United States have already pushed the construction of civic centers to completion, Denver refuses to be shaken from her conservative attitude.

Many features are yet in the embryonic stage, no designs having been adopted. Among these are a fountain to be placed in the southern extension of the Center to correspond in general outline with the Pioneer Monument, which occupies a projecting triangle on the north, and two statues, illustrative of the spirit of the West, which will be placed in the Central Plaza. This plaza will appropriately be known as the Plaza of the Past.

The history of how Denver has carried this immense project to its present stage is most interesting and sets an object lesson in civic pride which other cities may well emulate. The plan as first proposed by Mayor Speer in 1904 was opposed bitterly by a group of taxpayers, so that at the close of his second term in 1912, only the land had been acquired. This, however, was a long step forward, as the land alone cost the city $1,500,000. The city then secured the services of an expert, Charles Mulford Robinson. The Robinson Civic Center plan was presented to the voters January, 1906, but met with defeat because of the heavy expense involved. During this same year, MacMonies, the sculptor, visited Denver to make a study of his Pioneer Monument, now a part of the Center. He suggested the present site and plan of the Center to the art commission, and the commission passed favorably upon it. The following year an independent commission was appointed which included a dozen prominent citizens. A thing that greatly favored the project at this time was the fact that all the lands to be included in the Civic Center were located in the East Denver Park District, which district, the oldest and richest in the city, had up to this time acquired all its parks largely through donations and without special assessment upon its taxpayers.



But perhaps the greatest factor in the success of the plan was the organization of a Civic Center Association. It was a sort of information bureau in connection with the projected movement in the east district, and slowly but surely educated the public to the benefits of the plan. Incidentally Denver received much free and widespread advertising through this work of its citizens.

The Court of Honor, the outstanding feature of the whole project, was the conception of Mayor Speer. So stimulating to civic pride did it prove, that since the announcement was made Denver has received from her citizens gifts of archways, art collections, fountains and the like, approximating $400,000 in value. The Vorheis Memorial archway, now in course of construction, and to be erected at a cost of $125,000, was the gift of Mr. J. H. P. Voorheis, an early pioneer of Denver, who left his entire fortune to the project. It will form a beautiful and fitting addition to the center, its plans including a waterscape, pylons and statuary.

It is planned that further improvements on the Civic Center will be made in so far as practicable without cost to the taxpayer. The Colonnade of Civic Benefactors, dedicated last year at a cost of $185,163, was erected by funds derived from an annual income paid by the telephone company for street improvements. Statues on the state house grounds are the gifts of private citizens. Other contemplated monuments will be paid for by the city from some special fund.

The smaller decorative features of the Center are noteworthy. Among these are: The two beautiful pictures on either inner side of the archway of the colonnade (these are "The Trapper" and "The Prospector" by Allen True); the sunken gardens immediately in front of the theater; the formal lawn lying between the library and the projected art building, the decorative detail of this lawn consisting of pylons and ornamental lighting fixtures, the whole flanked by a low railing of Grecian design.

That Denver appreciates and makes use of the advantages offered it through the Center is proven by crowds which attend its semi-weekly band concerts, the auditorium which seats 5,000 always being comfortably filled. The theater was completed during 1919 and the city celebrated its first community Christmas there when immense crowds gathered each evening during the pre-Christmas week.

Crowd at one of the semi-weekly band concerts, Denver Civic Center.

Why and Because

Why is the rabbit or hare associated with Easter and Easter eggs?

Because in Europe as well as Asiatic countries the hare has been from ancient times the symbol for the moon, and the movable feast of Easter is governed by the lunar orb. The moon is the "open-eyed watcher of the night," and the hare is a nocturnal animal. The young of the hare are born with their eyes open and are said never to close them. In many parts of Germany the children firmly believe the myth that the hare lays the Easter egg, and the association of the moon, Easter rabbits, and Easter eggs is everywhere the same, with its symbolism of spring and the awakening of life.

Why is the cross placed on Good Friday buns?

Because the Good Friday bun is associated with the ancient "bonn" which was an offering of cake, or sweetbread, to the gods. Cecrops is supposed to have introduced this bread which bore the marks of two horns. The Greeks are believed to have substituted a cross later, apparently for the easier division of the round bun into four equal parts. Maitland, in his account of London, 1739, ascribes the cross to the bakers, who, perceiving the great profit that arose to the clergy from the use of the symbol, adopted it for their buns.

Why do we always shake hands with the right hand?

Because in the days when people were not as peaceable as they are now, every man carried a sword or dagger to defend himself. This sword was worn on his left side, where the right hand could quickly grasp it for use in time of peril. When a man wished to show that he was friendly, he extended his right hand, which would be clasped by the other's right hand, if he, too, meant peace. Thus each would be sure that the other would not draw his sword.

Why is the fourth hour marked IIII on clock and watch dials, instead of IV?

Because, when the first clock, resembling those in use today, was made by Henry Vick in 1370, for Charles the V, of France, surnamed the Wise, the king found fault with the Roman numeral IV. He said it should be IIII. Vick ventured to suggest that the king was mistaken, whereupon Charles roared: "I am never wrong! Take the clock away and correct the mistake at once on pain of my displeasure." The figure was altered to IIII and has so remained ever since.

Why is it customary to mount a horse from the left side?

Because, in the days when a sword was an essential part of a man's dress, and hung at the left side, mounting from the right side would have necessitated taking hold of the scabbard and placing it over the saddle with the hand needed to assist in mounting. By mounting from the left side the sword hung clear and allowed easier action.

Why is a man called a "bridegroom" at his wedding.

Because in primitive days, the newly wedded man had to wait upon the bride and serve at her table upon his wedding day, and thus was a "groom" on this occasion.

Why is Ireland called the Emerald Isle?

Because of the richness of its verdure, the term being first used by Dr. William Drennan, the author of "Glendalloch," and other poems, published in the latter part of the eighteenth century.

Why do soldiers fire a volley over the grave of a dead comrade?

Because in days gone by, when superstition was practically universal, it was generally believed that making a noise kept away evil spirits, and the passing bell came into vogue for that reason. When firearms were invented, volley firing was substituted for the passing bell, the belief being that the sound of battle would be more efficacious in the case of a soldier.

Why do we speak of giving a person the "cold shoulder"?

Because of the custom once prevalent in France of serving to a guest who had outstayed his or her welcome a cold shoulder of mutton instead of a hot roast as a hint for them to go.

Why do we speak of the "near" and "off" horse?

Because in the days when the driver walked beside the horses his position was always at the left, with his right next to the team. Therefore, in driving a pair, the horse on the left was nearer than the one on the right. The "near" horse is always the one on the left.

The Political Hegemony of France in Europe

Views of Republic and Britain for Obtaining Better Europe, Differing Fundamentally, Are Not Expected to Be Changed

By W. P. CROZIER

THIS news-letter by Mr. Crozier, with whom the readers of The Dearborn Independent have become well acquainted as a result of his correspondence discussing the problems of the British Empire and its relation to the Continental nations, has to do with the extension of French influence in European capitals and the activities of French diplomacy.

Manchester, England, November—(By Mail).

AMERICANS are deep in the dust and turmoil of their presidential election, of which the loud echoes reach us over here, and we wonder whether they have time to be aware of what is going on in Europe. Twelve months ago an acute American journal wrote that the result of the war and of the Treaty of Versailles had been to confer on France the political hegemony of Europe, and on the whole this was a true saying. The activity of the French Foreign Office has been and is remarkable in almost every capital in Europe. From the Baltic States down through Central Europe into every little country on the Danube and beyond, the French diplomatists are busy spinning the webs of their new Europe—spinning and re-spinning, for as fast as their work is done events unravel it, and with or without changes it is done afresh.

Hegemony, however, implies that where one leads the others follow and, as time went on, it became evident that in spite of all the diplomatists' denials a certain divergence was growing between France and her principal allies, England and Italy, not to mention that declaration of President Wilson's, which sent a thrill of annoyance throughout France, to the effect that the militarists were in the saddle at Paris. For some time there has been a coldness between France and Italy, for Italy and France, like France and England, think each of them that the other is following only its own selfish interests. So, recently, a meeting was brought about between the French and Italian premiers. It ended, as such meetings always do, in the most sugared declarations that complete and cordial agreement had been reached between the statesmen, but alas! with such qualifications as that each country reserved the right to follow its own policy toward Russia, these policies being notoriously opposed.

Differences Growing for Months

THE divergencies between France and England have been growing for months. They became worse when M. Clemenceau handed over the premiership to M. Millerand. They remain unabated now and since M. Millerand intends as president, according to his own plain declaration, to carry out his personal policy, they are likely to become worse rather than better. On some of the principal questions both of tactics and of principles, England and France are pursuing separate paths. The French press, whose attacks on England are bitter and persistent, declares categorically that France will no longer pursue the course into which she was recently persuaded by Lloyd George with regard to Germany nor will she join with him in his Russian policy. Everything that M. Millerand has lately done and is now doing bears this out. One would not lay all the blame unreservedly at the door of France. The French say that it is Mr. George who insists on a separate and independent policy. The truth is that the views of the British and French governments for obtaining a revived and a better Europe are differing fundamentally and it is becoming more and more difficult to reconcile them.

Take the case of Germany. The fixed intention of France is to take her stand on the letter of the Versailles Treaty, to insist on the literal and punctual fulfillment of every clause and to exact penalties from Germany in every case of non-fulfillment. France demands her pound of flesh. The amount of reparation to be paid by Germany was to be fixed by the reparations commission on which Germany herself should have no voice. This meant that Germany was liable to be crushed, year after year, beneath a burden which she would be unable to support. There neither was nor is any prospect of wringing from her the sums which in theory she undoubtedly owes by way of reparation. Without shipping, without a large part of her resources in coal and other raw materials, she is clearly incapable either of paying a full measure of reparation or of getting on her own feet again.

French Act Independently

THE British Government at length came to take the view that the literal interpretation of the treaty would work to the profit neither of the Allies, nor of Europe, nor even of France; that since Germany would be able to pay something, it would be better to talk with her across a table and find out what that something was; that in short both for the purpose of obtaining reparation and for the purpose of our own good health it was necessary to have some regard to the economic health of Germany.

These are two different policies. That of France is to wring from Germany all that can be got from her and to keep her down in an economic sense indefinitely; that of England is to look rather to the general revival of Europe and to help Germany not only to help herself but to pay her debts to the Allies. With this policy in mind Mr. George persuaded the French premier to go, however reluctantly, to the Spa Conference, which the Germans also attended. That conference was to be resumed later at Geneva, but in the meantime there was a financial conference at Brussels from which France has drawn certain conclusions. She discovered there that she is not likely to obtain much financial aid from other countries whether neutral or allied. The United States, the French press says, made it clear that any assistance which she henceforth gave to France must be conducted on a business and not on a philanthropic basis. That was both reasonable and inevitable, but the French drew from it the deduction that they must get what they could from Germany independently. They entered for a time upon separate negotiations at Berlin with regard to reparation. Their press proclaims exultingly that no more will be heard of the Geneva Conference. It is a further step on the road to independent action on which France first embarked when she sent troops to seize more German towns as a penalty for German action in the Ruhr. Unquestionably it is a rebuff to Mr. George, who stands by the policy of a conference of all the Allies jointly with Germany.

The Disarmament Question

THEN there is the question of disarming Germany. Some time ago the French quite reasonably raised a great outcry over Germany's failure to disarm according to the Versailles Treaty. The question came up at Spa and the German Government promised immediate compliance. Northern Germany has now disarmed but not Bavaria. In Bavaria alone, it is believed, there are more troops in arms than the whole of Germany ought now to be maintaining, but the government at Berlin is powerless to make its will effective. But the most curious thing is that France makes no protest at all about Bavaria. There is a political reason for this: not many months ago France insisted on sending a special representative to Bavaria in defiance of the protests of the German Government, and now there is in Bavaria a strong clerical and monarchist party which France favors and supports. All these troops that are maintained in Bavaria are in the hands of the reactionary monarchist leaders, among whom are the great Ludendorff and Prince Rupprecht, of Bavaria, himself. At any moment a coup d'etat may take place in Bavaria and the monarchy be re-established and, if it comes, it will be with French approval and support, for France, so anti-clerical and republican at home, is clerical and monarchist abroad wherever her policy demands it. This is the reason why of late she has drawn much closer to the Vatican. Her policy demands a strong Poland against Germany and Russia, and Poland is clerical. It demands a strong Bavaria against North Germany, and Bavaria is clerical and monarchist in sentiment. It demands also a monarchist Austria, since a republican Austria will always be in favor of union with Germany, and Austria, of course, until the war, was the chief Catholic state in Europe.

At the present moment, it should be realized, French policy supports a monarchist reaction in three countries, Bavaria, Austria and Hungary. The Austrian National Assembly is threatening to take a vote on the question of union with Germany. The Treaty of Versailles forbids that union, whatever the opinions of the peoples concerned may be. This was done at the instance of France, which is furious at the latest news. If the monarchy were restored in Austria, she thinks the evil day would be at least postponed. In Hungary the motive is different. France looks round everywhere for allies against revolutionary Russia. A monarchist Hungary is her best hope on the southern front and in fact she recently angled for Hungarian aid against the Bolsheviki, promising assistance of all kinds. The Central European papers are full of an alleged treaty of alliance between Hungary and France. The result, at all events, has been that the small states who hate and fear the Hungarian reactionaries have joined together in a league of their own, the so-called "Little Entente."

If then, Hungary is at daggers drawn with this new league, if the reactionary monarchies which we had thought we were finally rid of were set up again in two or three states which had destroyed them, if Austria is threatened with a monarchist *coup*, all this would not be done without the support of the diplomacy of France. Europe at the present day is not to be understood unless it be remembered that the aims of French policy are the permanent enfeeblement of Germany, the surrounding of her with a ring of hostile states who are all to be the clients and protegés of France, the prevention at all costs of co-operation between Germany and Russia (which is the nightmare of the French as it is of some Englishmen like Mr. Winston Churchill) and the overthrow of revolutionary Russia. Europe is not to be understood, either, unless it be remembered that these jugglers' combinations which the French produce in Southern Europe are looked on with the utmost suspicion by Italy. The break-up of Austria removed a burden that had long weighed over Italy. When Italy sees that owing to French policy the small states that arose from the ruins of the war are beginning to draw together into larger units, it is little wonder if she feels resentful toward her ally France.

Russian Problem Causes Dissension

MOST notable of all is the divergence between France and her allies over Russia. I have seen it reported in America that Lloyd George is for peace with Russia solely because of English domestic politics. That is not so. He has long been convinced that if we ourselves and Europe as a whole are to regain social and economic health there must be peace in and with Russia. That is the origin of the commercial negotiations and of the political peace which, despite the recent rupture, will almost certainly follow before long. France agreed to these commercial parleys. In the middle of September, M. Millerand said, "I have loyally carried out that agreement," but in fact he speedily withdrew from the negotiations. Mr. George, until he recently dismissed M. Kameneff, steadily pursued the idea of a general peace with Russia. M. Millerand himself said, "There must be an end of war with Russia." But in fact he and his government gave formal recognition to General Wrangel and are lending him active aid. Mr. George is for peace; France is for war. What are the French aims in Southern Russia, where as is just announced she is making a new effort in support of Wrangel? No one is quite sure, but a document from one of her agents not long ago described the Ukraine as a "beautiful colony" for France. And a well-known authority on Russian affairs, whose writings are as much read in America as here, observed to me the other day that in his opinion the only explanation of French activities and French policy toward Russia was that she aimed at creating a great "sphere of influence" on the shores of the Black Sea. All statements that may reach America to the effect that Mr. George is weakening in his purpose and is submitting to the policy of France in respect of Russia should be treated with complete distrust. Their principles and aims are different and it is difficult to see how they can now be reconciled. At present they appear to lead to an end in which England will be found at peace with Russia while France continues to make war.

Sacrificing the Future?

FRANCE knows her own interests best, but to many of us she appears to be shortsighted, sacrificing the future to the present. If she could build up, as she desires, a grandiose Poland as a barrier between Germany and Russia, how unhappy would be the plight of such a state in twenty or thirty years' time or perhaps less. Some day the great Russian people will revive. Germany cannot for all time be made a slave-state working for her neighbors. Permanent hostility to Germany and Russia will not prevent them eventually from establishing contact, over the body of Poland if there be no other way. Justice will not permit that Austria for all time should be kept apart from the Germany that she desires to join. Not always can Germany and Austria and Russia be kept outside the League of Nations and finally, to go to the foundations of the question, how can France herself gain in the long run by prolonging strife and civil war over a large part of Europe, by perpetuating the reign of the old diplomacy and the old doctrine of force, and by frustrating the idea of international co-operation and the inter-dependence of civilized communities? For ourselves we make no bones about it. We are no more interested now than President Wilson declared himself to be in 1918 in partial leagues and counter-leagues, which make only a barrenness and war. We maintain that our own well-being and the well-being of the great countries and vast populations of Central and Eastern Europe depend on peaceful co-operation and that it is our duty as well as our interest to pursue these, if possible, in accord with our ally, France, but if necessary, alone.

Introducing to You His Majesty—King Peanut

Don't Scorn Him! He Is Becoming More and More Important. Thousands of Acres Now Given Over to Crop

By R. P. CRAWFORD

THE King of Nuts! Surely there is no other nut in all the world that can claim this title, save the peanut. For years it was associated only with the street vendor, but today—a few years later—there is probably no nut with such a wide variety of uses. Hogs and cattle grow fat, vast mills turn thousands of tons of the nuts into a famous oil of commerce, peanut butter has become a staple article, and peanuts have even become one source of flour. The story of how the little nut helped to redeem Southern agriculture is a story by itself. For the last three years, at a very conservative estimate, more than a million and a half acres on an average have been planted to peanuts in this country every year. Last year, 1919, approximately $80,000,000 worth of the nuts were sold from the farms of this country. Contrast this with $7,000,000 worth of the nuts raised in 1899, and $18,000,000 worth in 1909, and one gets some idea of the growth of the industry in this country. More than three times as many acres are devoted to peanuts in this country as twenty years ago, and yet the peanut was one of the earliest crops to be grown in America.

Its products now form articles of world commerce. The manufacture of peanut oil, which was long confined to Europe, is rapidly becoming a flourishing industry here. Most people, especially in the North, do not know that the peanuts themselves are a superior hog feed, and in many sections of the South the hogs are simply turned out to harvest the crop. The trailing vines make a good hay for cattle. Peanut oil cake, another cattle feed, is one of the by-products of the industry.

Did one ever hear of "creamed peanuts on toast" or of peanut bread? A short time ago the United States Department of Agriculture set out to discover some of the uses and food properties of the peanut, and some eye-openers have been the result. As incredible as it may seem, the investigators for the Department of Agriculture, H. S. Bailey and J. A. LeClerc, found that a pound of peanuts furnished 2,700 calories, three times as much as a pound of beefsteak and five times as much as a pound of eggs. In fact, it was ascertained that a pound of whole peanuts contained a half pound of fat and a fourth of a pound of protein. These scientists became so enthusiastic over the possibilities of the peanut that it caused them to characterize it as "one of the most nutritious foods known to man." A satisfactory bread is made by combining peanut flour with wheat flour.

In fact, the story of the peanut is one of the most romantic stories of American agriculture. It now seems to be generally agreed that the peanut is a native of tropical America, probably Brazil. The early American colonists brought some with them, planted them, and gradually developed the famous Virginia peanut. For years it was the custom of practically all plantations to have at least a little patch devoted to the nut. But for the most part, the peanut was still a novelty, being planted mainly for the sake of the children, and as the years went by a few were always harvested for the commercial market for roasted peanuts. But then came the great peanut revival, or rather extension, brought about by the development of proper machinery for harvesting and handling the crop.

Peanuts got their real start in the South due to ravages of the boll weevil on the cotton crop. When a search was being made for a crop to substitute for cotton, the peanut was hit upon. The peanut can often be grown where corn cannot be raised to advantage, since it does well even in the drier sections of the Southwest. Peanuts have been known to yield satisfactory crops where corn did not yield more than five bushels to the acre. Peanuts also have the advantage of enriching the soil the more they are grown, since being a leguminous crop they supply nitrogen.

The peanut is unique in that it ripens beneath the ground. In planting it used to be necessary to open the furrow with a plow or other implement, drop the peanut in, and then cover it with a cultivator or some other implement. Now the work is largely done by means of peanut planters. With these machines the entire planting is accomplished with one operation. In fact, all along the line it has been the development of modern machinery that has brought the peanut to the fore. Formerly in harvesting it was the custom to pull the plants out by hand or simply use a one-horse plow. Today the larger growers use a machine something like a potato digger. Pulled by four horses, such a machine can dig eight to twelve acres a day. With this method most of the soil is loosened from the peanut, again avoiding much hand work.

The stacks of peanuts scattered over a field are a unique spectacle. First, poles three or four inches in diameter and seven to eight feet long are secured. They are set into the ground a foot or so and made secure. About eight inches from the ground two pieces of lath are nailed crosswise. This prevents the peanuts coming in contact with the ground. The vines are wound around the pole, the pods being kept to the center. A bunch of the vines are pressed down over the top of the stake, or grass or weeds are used to form a secure top over the stack. The peanuts being near the center of the stack have a circulation of air and are protected from the inclement weather. Although efforts have been made at various times to improve this method of stacking, most of them have been unsuccessful and this plan has stood the experience of many years.

Above: Revolving drums used for roasting peanuts before being made into peanut butter.

Below: Spanish peanuts, showing the root system. The plant gathers nitrogen from the air and stores it in the nodules on the roots, making the plant a valuable one for the soil.

The peanuts are cured for three or four weeks in the stack before they are picked or threshed. Peanut picking time used to be quite an event in the South, and this arduous duty usually fell to the colored hands about the plantation. But today picking machines are used for this work, doing away with the hand labor. Often common grain threshers fitted with a special cylinder are used for removing the peanuts from the vines. In the case of a typical peanut picking machine, the work is done by pulling the vines over a frame covered with wire mesh. On the lower side of the screen is an endless belt of rubber brushes. As the nuts drop through the screening they are scraped off by these brushes. A good picking machine will handle from two hundred to four hundred bushels every day. The nuts are then ready for market and either are placed in warehouses to await a higher price later in the season, or are sold direct to the numerous factories in the South.

Today peanuts and hogs are synonymous in many localities, and the hogs simply do the harvesting. Sometimes the peanuts are planted between rows of corn. The cattle can then be turned in after the corn is harvested to eat the fodder and peanut tops and the hogs are finally turned in to eat the peanuts. Often successive plantings of peanuts are made at intervals of fifteen to thirty days so that there is a constant supply for the hogs until late in the fall. The hogs are confined to sections of the field by small portable fences. The average yield of peanuts to the acre under fair conditions is about thirty-four bushels in the shell, while a good yield is sixty bushels with a ton or ton and a half of hay an acre. Yields as high as one hundred and fifty bushels, with two tons of hay, have been recorded. The peanut hay for one year had an estimated valuation of approximately $20,000,000.

There are two principal varieties, the Virginia peanut and the Spanish peanut. The Spanish type averages about 70 per cent kernel while the Virginia type averages only 65 per cent. The Spanish peanuts are usually smaller and are especially well adapted to the manufacture of oil, while the Virginia type are the ones usually used for roasted peanuts. The two are generally combined in the manufacture of peanut butter, since the Spanish nut gives a smoothness, and the Virginia nut a flavor to the product.

The peanut butter industry is one that has come to the front in recent years. In fact, contrary to the general impression, probably less than a fourth of the total crop is sold as roasted peanuts. The peanut butter manufacturer usually secures shelled nuts. The nuts are roasted in machines something like coffee roasters. It generally takes about a half hour to roast a batch of nuts. Then the peanuts are blanched, this being done by machines which have a set of brushes running against a corrugated plate, thus removing the little red skins. The peanuts are then carried over screens through which there is a strong draft of air which removes any small pieces of the skin. Women also pick out any bad or decayed nuts as they are carried along on a long canvas belt. Then the nuts are fed into the grinder. Usually the Virginia and Spanish nuts are used in equal parts, or two or three parts of Spanish to one part of Virginia, a better product being secured when the two varieties are blended. Salt is added as the nuts are ground.

The peanut oil industry is becoming one of the great peanut side lines of the country. For instance, the production of refined peanut oil for the three months ending June 30, 1920, was more than 20,000,000 pounds. Formerly Marseilles, France, was the great center of the oil industry. But today American factories are rapidly challenging the supremacy of the foreign product. In fact, the manufacture of peanut oil in the United States did not begin until about five years ago. Peanut oil may be made either from the unshelled or the shelled nuts. Needless to say, the best oil is made from those that are shelled. The oil is usually secured by pressing the nuts, and after the first pressing a second pressing is made, often with the nuts heated, to secure all of the oil. The second pressing yields a lower grade of oil, usually used for soap. The first pressing yields a good edible oil which can be used for cooking. The residue after the pressing forms a cake which can be used for stock feed. Peanut oil may enter into the composition of the various vegetable margarines and also the lard substitutes.

The possibilities of the King of Nuts have probably just begun to be realized. As with many another article of trade, they are limited only by the ingenuity of the farm and factory.

The Old School Atlas and the Changing World

Among Changes Six Years Have Wrought Is Establishment of Eleven New States in Europe as Result of Great War

IF YOU want to spend a really sad evening, take a turn with the old school atlas. Tentative atlases are beginning to appear but it will be a little time yet before things are steady enough for an honest-to-goodness atlas, like father used.

The old school atlas stayed put for a long time; a few little items changed here and there, but not enough to muss up the maps. Now when you open the book at any of the war-ridden countries, you find things that aren't; places with tragic memories; whole states which have shifted.

None more tragic, perhaps, than the map of the old German Empire, even though that of Austria-Hungary tells a more dramatic story.

However . . . .

In that happy distant spring of 1914 there were on the continent of Europe 24 separate states (counting the German Empire as one). Today there are 35 (still counting Germany as one).

That really tells the story of the era. That sums up more or less the tangible historic consequences of the war, for the birth of a state is of more consequence than the death of a king.

Three of the neutral states have been directly affected by the war. They are Denmark, Luxembourg and Liechtenstein. Denmark lost Iceland. Bless me, had you forgotten that? Iceland declared its independence in December, 1918, and forced from the Danes recognition of its sovereignty. Christian X, king of Denmark, is also king of Iceland, but the title is a separate one, and that forms the only link between the two countries. Iceland has a healthy national debt of $500,000 and is well on the way to be numbered among the fancy powers who live on credit. She has a university and a mercantile marine, a parliament and a cabinet, but no railways and no army or navy. Her area is 40,000 square miles and her population 100,000.

Luxembourg has always been considered a sort of appendage to the German Empire, was included in statistical surveys of the German iron ore district, and was part of the German Zollverein. But today public opinion in Luxembourg is divided between economic union with France and economic union with Belgium, the former having the majority of adherents. France and Belgium being on the best of terms, neither of them is pushing the matter.

The tiny principality of Liechtenstein—a mere speck on the map between Austria and Switzerland—was formerly a dependency of Austria. Liechtenstein includes a population of 10,000—equal to a small American town. In November, 1918, the 10,000 threw off the Austrian yoke and declared themselves a free and united people; so they issue their own postage stamps and have made tentative approaches to Switzerland with a view to becoming a member of the Swiss Confederation. So much for the neutrals. Now look at Germany. In 1914 the empire included 25 separate political entities, with Alsace-Lorraine. Today there are 18; Alsace-Lorraine has passed to France; and Germany has contributed territory to Poland, Belgium, France, Denmark, Czecho-Slovakia.

Moreover there is a tendency toward unity among many of the German states, and the only apparent obstacle to a large central movement is the aloofness of Bavaria. Bavaria because of her size, always has been jealous of Prussia, or of any movement which tends to submerge her own identity. Already, however, the Free State of Coburg has joined Bavaria; while the remaining seven Thuringian states have formed a new combination, under the title Thuringia. The smallest Thuringian principality had only 216 square miles and the largest 1,397 square miles. The new Thuringia has 4,548 square miles and a population of 1,500,000.

New Austria is in a bad way. She now has a population of 6,000,000 instead of 29,000,000. Moreover the territory around Vienna is no longer sufficient to support the city, and hence hunger is acute. The Austrians desire to form some sort of union with the German federation. They are Germans, in every sense of the word, and their attitude is logical. The only objection to such a union naturally would come from Italy. Recently, however, a special committee of the Italian parliament reported favorably on such a union, which they realize is an economic necessity for the Austrians.

Under Clause 88 of the St. Germain treaty, however, Austria is forbidden to compromise her independence without the consent of the League of Nations; in other words, can't self-determine on her own account, although the treaty itself was founded strictly on that principle, thus freeing Czechs, Magyars, Croats, Slovaks, Jugo-Slavs, all of whom have formed such political arrangements as they pleased.

Austria, nevertheless, contrasts well enough with Hungary, for Austria represents an up-and-doing spirit, while the Magyars are reactionary and willing enough to let things be indefinitely. Hungary is still officially described as a monarchy, and the Magyars have little if any interest in the forms of democratic government. Within the past two weeks the whole of the former Hapsburg empire has become excited at the publication in the Socialist organs of Austria and Czecho-Slovakia of documents tending to show a Magyar conspiracy directed against the new states, and planning for a reconstruction of the dual monarchy under a Hapsburg and with Hungary as the chief state.

The most important of the new states in that part of the world is Czecho-Slovakia, where amazing progress has been made, quietly but perseveringly. Its boundaries are not yet wholly settled, but President Thomas G. Masaryk has not allowed this to impede reconstruction, and it is probable that Czecho-Slovakia is the most stable state in Central Europe.

Greater Serbia is still in a state of flux. The war has increased Serbia by three times; in 1914 her area was 33,000 square miles. The Jugo-Slavs have not been able to make such headway as the Czechs and Slovaks to the north, and to this delay Italy has contributed something over the Fiume dispute. Just at present Greater Serbian ambition wishes to annex Montenegro, and proposes to follow D'Annunzio in Fiume and the Poles in Vilna by presenting the world with a *fait accompli*. Montenegro does not wish to be annexed, and the powers are opposed to such an event, hence Greater Serbia may find therein the first serious check to her course of empire.

There are three new states in the Caucasus very much in the news, although the chances are that none will be in the news very much longer. They are Armenia, Georgia and Azerbijan. At present the Turkish Nationalists are invading Armenia in a thorough fashion; the Bolsheviki are camped on the frontier and Georgia is talking about "defending her neutrality" —she having promised Armenia to remain neutral. Armenia has a chance of life, due to the world interest aroused in her behalf. Georgia doubtless will disappear, and Azerbijan scarcely exists. No one knows definitely the status of any of the states.

The Ukraine—Russia's granary—is the most confused state in Europe; it has no central government, no army, no boundaries, and no capital. The Ukrainians are an ambitious people, but at present have no rallying point except General Petlura, the peasant leader, and his following rises and falls with his success and failure in the field. The Ukrainians have sent out numerous missions to raise money with which to build the national fortunes, but the internal confusion not unnaturally makes investors wary.

Doubtless the most impressive changes in the destiny of nations are to be seen in the former Russian Empire. Nine states have been created out of old Russia, of which three in the Caucasus and the Ukraine already have been noted. Of the other five, two certainly are permanent factors in the new Europe; these are Poland and Finland, and both have been recognized by the powers. The other three states are the Baltic States, and have been more or less recognized and are thought to be in a fair way to establish themselves as permanent elements in reconstituted Europe. Esthonia, Latvia and Lithuania are free republics and seem disposed to adopt the best democratic traditions. They are showing constructive ability, and an evident desire to avoid falling under the thrall of either Finland or Poland; both these states would like to head the "Baltic group."

In addition to these nine states out of Russia there are vague entities in Siberia and in Southeastern Russia, such as the Daghestan and Kuban republics. Then there is Russia proper, to which the Soviet and Wrangel are rival claimants.

Poland and Finland represent two widely different interests. Both have an old civilization and are enjoying a manner of renaissance. But Finland never has lost a certain recognized individuality, while Poland was depressed by its several invaders and kept so purposely. Finland possesses tradition, literature, music, industry, all of which might surprise the world if the world were not in the habit of considering Finland as a crude outpost of civilization.

Of Poland, of course, there is no lack of information, and while German, Austrian and Russian Poland differ very much from each other, the effort of the Poles to unify her portions receives the sympathy of the world, although it is conceded that the state has grave days to pass. The whole problem of existence for these new Baltic States rests on the future of Russia proper. There is and always has been from the first revolution a powerful body of Russian statesmen intent on seeing a reunited Russia. This idea has as its first principle the absorption of the Baltic States into the new Russia, since all the Baltic ports are in the possession of these states. Out of this idea, and supposing the new states cling to their independence, there is the suggestion of a federal Russia, which should include even Poland.

No one supposes Finland ever will be in such a federation. Finland, in spite of all the czar could do, held herself strictly aloof from Russia and was amazingly successful in wringing concession after concession from the autocracy. Her interest lies more with Sweden and the Europe of France, Britain and Scandinavia, than with the Europe of the Slav.

Your Own United States

Everywhere, between and touching the icy glacier fingers, are gorgeous gardens of luxuriant wild flowers. "As if Nature," writes John Muir, "glad to make an open space between woods so dense and ice so deep, were economizing the precious ground."

Trade—Commerce—Industry

A pamphlet of 128 pages, presenting a summary of the mineral production of the United States in 1919, has been issued by the Geological Survey, Department of the Interior. Copies may be had on application to the director of the United States Geological Survey.

So serious is the loss of alcohol in transit from bonded warehouses to laboratories and manufacturing plants that the government is considering the possibility of requiring purchasers to medicate the alcohol before removing it from the warehouse so that it will be unfit for beverage purposes.

The Navy Department is offering five old warships and 25 miscellaneous vessels for sale. The department expects to realize $1,000,000 on these vessels.

Military experts believe Russia has enough munitions to continue her war against Poland for five years. These munitions consist of military supplies furnished to the old imperial régime by the Allies and to material captured from various anti-Bolshevik leaders who have been sent against the Soviet Government.

The Department of Justice has announced that it intends to invoke the Lever Law in curbing the profit-taking in the sale of lemons. The department specifically names the retailer as the profiteer and states that the lemon growers are getting the smallest return on their investment that they have been forced to accept in many years.

Four hundred thousand dollars' worth of pure-bred American live stock was sold in South America the first six months of this year. Reports received by the Bureau of Markets indicate that live stock trade with South America can be developed very rapidly and that the opportunities there for the stock raisers of this country are excellent.

Campaign contributions may not be included under the heading of "charities" when making out an income tax return. The income tax regulations hold that "contributions for campaign expenses are not deductable from gross income."

The Bureau of Statistics of the Geological Survey announces figures in its report of November 1, which shows that the coal mines have produced more than 12,000,000 tons of coal weekly for three successive weeks. The production for the present year is now 8,500,000 tons behind 1917, 43,500,000 tons behind 1918, but 51,000,000 tons ahead of 1919.

The United States Geological Survey has published a bulletin on fuel briquetting in 1919. The following subjects are covered: production, value, raw materials and binders and list of plants. Copies may be secured on application to the director of the Geological Survey, Washington.

The foreign-trade bureau of the St. Louis Chamber of Commerce has combined with the local representative of the United States Bureau of Foreign and Domestic Commerce and export managers of large industries in the organization of a world trade club with a membership of 100. The object of the club is, of course, the promotion of the foreign-trade interests of St. Louis and the Mississippi Valley. It will hold regular meetings and authorities in various lines of export trade will be brought to St. Louis regularly to talk before the members.

German goods are again arriving on the British market in considerable quantities. Dealers are said to be stocking German Christmas goods, in preference to articles of British manufacture, because the imported products are the more attractive. The Germans are delivering toys three weeks after the placing of orders and although their prices, except in the case of jointed dolls are somewhat higher than those of British manufacturers, the trade prefers the imported goods. Many small British concerns which engaged in the manufacture of toys during the war are said to be closing down as the result of the new competition.

The supply of natural gas is so near the point of exhaustion that glass manufacturing concerns are installing their own gas producing plants and for the first time in the history of the industry will rely upon coal for their fuel. The public utilities commissions of Ohio, Pennsylvania, Kentucky and West Virginia have announced that the use of the small supply of natural gas which remains will be restricted to lighting and heating homes. It is feared that as a result of the change the price of glass will not follow other building material down the ladder of readjustment.

It is expected in Washington that the organizations which represent the farmers will carry their appeal for financial aid in the marketing of crops before the next session of Congress.

The shortage of railway cars has become very acute in Canada. The railroads have issued statements showing that much of their rolling stock is held in the United States. It is pointed out that the United States will probably face a lumber shortage in the Middle West as a result of the crippling of the Canadian lines.

The October report of the Federal Reserve Board expresses the opinion that recovery from war and post-war conditions is proceeding rapidly in the United States and that, although there has been some suspension of activity, the economic situation shows signs of strength and all signs point to the accomplishment of the transition without undue disturbance. One of the outstanding features of the month, says the report, was continued caution in buying, due to the belief that the period of price readjustment is not yet closed. The retail trade on the whole reported moderate increases in net sales over the same month of the previous year but the board states that the usual fall activity is lacking. One reason for this is found in unseasonable weather. Reports from many sections were to the effect that the retailer is awaiting developments before renewing his stocks. This is said to have hit the cotton mills and textile factories and the shoe and leather industry a hard blow. The general condition of labor is said to be good, despite the fact that there have been decreases in wages in some employment centers.

Canada, during the last twelve months, bought goods from her neighbors to the cost of $919,000,000, and exported goods to the value of $513,000,000. Canadian imports from the United States during that period exceeded the exports to this country by $400,000,000.

The seriousness of the exchange situation for Argentine firms importing American goods and the danger of America losing trade to Europe was the subject of discussion by the United States Chamber of Commerce, in its weekly review of affairs in Buenos Aires recently It was stated that while many American houses are carrying Argentine clients to the limit of their abilities by extending credit, additional renewals, constantly solicited in large amounts, make forced payments imperative. A probable solution would be offered by American investment in high-grade Argentine securities or through American loans to Argentina. Another suggestion that met with approval was that the Federal Reserve Board should permit member banks to rediscount Argentine paper.

Officials of the Bureau of Internal Revenue are considering the advisability of designating the places at which commodities containing alcohol can be sold. It is suggested that the sale of extracts may be limited to grocery stores and delicatessens, that only drug stores be permitted to sell medicinal preparations and that perfumes be limited to drug stores and department stores. This would eliminate the sale of medicines by country grocery stores.

The consumption of milk was increased 30 per cent in Spokane, Washington, through a campaign conducted by the state agricultural college and the Spokane Farm Bureau.

A late Treasury report puts the amount of outstanding Liberty bonds and Victory notes at $19,534,018,933, as compared with the original issue of $21,432,913,636. This is a reduction of almost nine per cent. The great share of the bonds returned have been handled by the sinking fund and bond purchase fund. Bonds have also been accepted, to a certain extent, in the payment of state and inheritance taxes.

Belgian business men have taken a new interest in export trade and an official committee, appointed to make a study of the conditions surrounding Belgian exports, has just finished a lengthy report. The committee recommends the immediate development of the Belgian merchant marine as the quickest and surest way of getting the desired trade.

The Comptroller of the Currency announces that the banks of the country are withstanding the strain of the transition period in an excellent manner. The report says in part: "Rapid and violent alternations of expansion and contraction have subjected our business fabrics, our financial system, and especially the banks of the United States to the most severe test of efficiency and stability that can be imagined. They have met this unprecedented test in a way to prove their solid strength and the wisdom and fidelity of those who direct them. The figures and facts must give the American people and the world increased confidence in the safety and power of the banking and business interests of this country."

The sale of toys in the United States, during the year 1919, amounted to nearly $100,000,000. It is estimated that $80,000,000 worth of these toys were of domestic manufacture. The manufacture of toys has been developed in this country during the last six years to a point where the United States now exports in steadily increasing quantities. It is said that many American toys make a particular appeal because of their scientific and mechanical nature. No other country, it is claimed, has developed instructive and educational toys in the same degree as the United States.

Austen Chamberlain, the British chancellor of the exchequer, recently said that while he could not welcome Australian corporations as borrowers of short money under the present circumstances (which would make them competitors with himself in Great Britain's hour of need) they would always have the British Government's good will when they invited investors to take up long-term issues for the development of the commonwealth.

Kansas farmers are using more than 14,000 tractors. Between March 1, 1919, and the same date in 1920, the number of these machines in use in that state increased from 8,684 to 14,370, or 65.5 per cent.

Governor Kelly, of the Australian Commonwealth Bank, recently announced that the commonwealth's total indebtedness of 700,000,000 pounds sterling was carried by a population of 5,000,000.

THE SUBSCRIPTION PRICE IN THE UNITED STATES, ITS DEPENDENCIES AND CUBA IS $1.00 A YEAR; IN CANADA $1.50 A YEAR; FOREIGN COUNTRIES $2.00 A YEAR

THE DEARBORN INDEPENDENT is engaged in delivering a great message to the American people. It is now being received by a Quarter of a Million who subscribe, and is read by nearly a Million more.

Unless one is a subscriber, he may miss important information. There is a continuity about some of the information we are giving which calls for a reading of the paper in series. We have decided to ask you, our friends and subscribers, to share the responsibility for a still wider circulation of THE DEARBORN INDEPENDENT and its message.

If you are desirous of some friend obtaining THE DEARBORN INDEPENDENT, attach one dollar, or your check or money order, to the blank, fill it in as indicated, and we will place his or her name on the subscription list at once, at the same time making known, if you wish, the person responsible.

UNIV OF ILL URB A ILL

Briefly Told

El Paso, Texas, is having its annual visitation of "boomers," itinerant workers who stay long enough in one town to get funds to carry them to their next objective. The sunny slopes of California are calling the boys from the cold northern cities.

One hundred and fifty tons of ballots were stuffed into the ballot boxes of New York City on election day.

Four hundred thousand dollars monthly will be required to run the League of Nations next year.

"Orangeade" and "orange crush" that never come closer to an orange than the tanks of a synthetic chemical laboratory are hereafter to be deemed "misbranded," and the venders prosecuted accordingly.

The ancient astronomical instruments, seized in Pekin by Field Marshal Count von Waldersee, of the German Army, in 1901 at the time of the Boxer trouble, and taken to Potsdam, have been returned to the Chinese Government.

One ton of wheat straw will produce the equivalent of forty gallons of gasoline, according to the United States Department of Agriculture.

The most northerly air service in the world is between Porjus, Sweden, and Suorvajaure in Lapland.

A hatchery with a capacity of 10,000 eggs will be used by a poultry products company in Montana. The products will be used to supply the Yellowstone and Glacier national park hotel systems with fresh eggs and poultry.

One hundred and ninety thousand men are being educated in the United States Army schools.

Thirty-five thousand head of Texas cows are to be sent to Germany for the purpose of rehabilitating the depleted dairy herds of that country.

A new invention in wireless telegraphy makes it impossible for eavesdroppers to listen in on reports of the League of Nations assembly which meets November 15.

For the first time in their lives many European children born during the lean war years will enjoy the taste of sweets next Christmas as a result of price declines in America.

Thousands of Frenchmen are no longer able to afford a daily meal of meat or eggs because of the soaring cost of living in France.

The continual rise in prices in the last few years has been the chief reason for the small number of business failures.

Italy proposes to collect all the bodies of Italian soldiers who died fighting on the mountain front and give them fitting sepulchre on one of the highest peaks, probably San Michele. It is proposed that a simple, noble monument be erected under which will rest together officers and soldiers, rich and poor.

Doping race horses was claimed by a Chicago race horse trainer as the reason for his having in his possession 62 quarts of whisky and $3,000 worth of narcotics.

Iceland will have a world's fair next June in Reikiavik, for the edification of the Eskimo.

A periscope of iron pipe projecting from a coal pile in a ship's bunkers at Antwerp led to the discovery of a stowaway in the coal who was using the pipe for breathing purposes.

A British imperial Polar expedition will make a six-year geographical, geological and meteorological survey of the continent about the South Pole with a view to commercial development of the frozen tract.

Out of the world's registration of 8,750,000 motor vehicles for 1920 the registration of motor vehicles in this country is 7,558,848.

The recent British coal strike is estimated to have cost 300,000,000 pounds sterling.

A 60-year lease of a tract of 400,000 square miles in Northeastern Siberia has been acquired by an organization of western American financiers who have exclusive rights to develop coal, oil and fisheries.

Industrial depression in Japan has affected the luxury shops of Tokio where Japanese souvenir dealers are forced to turn their endeavors to the sale of more necessary articles.

Great Britain exported 26,400,000 pounds of candles in 1919.

To hand over his business to the local trade union to be run for the profit of the union for two years is the public offer made by an English oil merchant.

Gold braid on the uniforms of Mexican generals and diplomats has been abolished.

Apparently the whole world wants to know about the court of industrial relations established in Kansas last winter. Inquiries concerning it from officials of eight foreign countries and seventeen states of the Union, the Philippines and Porto Rico, have been received by Governor Henry J. Allen. Members of 15 state legislatures have written his office that they intend to draft bills providing for the establishment of similar courts.

The boys of the country are rushing into the army in unprecedented numbers. During October more than 17,000 enlisted, most of them for three-year periods.

Fifty-one million dollars was furnished by the American Red Cross to war-stricken Europe last year.

The citrous black fly, an insect pest which attacks many plants in Cuba, the Bahamas, Jamaica, Canal Zone and other tropical fruit countries is becoming so noxious there that the Agricultural Department is considering disinfecting all shipments from those countries.

Rats from the trenches of war-ridden France are invading Paris.

Dustile tungsten, a new metal used by electric companies to double the efficiency of electric lamps, is worth from $50 to $150 a pound.

An airplane of which the wing surface can be increased or diminished during the flight and the speed proportionately varied has been successfully demonstrated at Paris and is said to resemble a bird in flight.

Sea sleds capable of carrying airplanes out in mid-ocean are being developed by a Boston concern.

The name "Old Faithful" has been given to an oil well in Kansas because the well today is producing just as well as the day it was brought in, eighteen months ago.

Twenty tons of apples—every one perfect—were distributed to the crowds on the main downtown streets of Seattle during the Apple Day parade held in that city, October 30.

A modern Noah's Ark docked in New York Harbor recently when a freighter arrived with 4,000 specimens of animals, birds and reptiles captured in Central and Northern Australia for the Bronx Zoo.

Large numbers of fossil sea-shells recently found on the coasts of the Andes Mountains indicate that the strata forming the mountains were once submerged below the level of the sea.

The United States is the world's largest coal exporter.

For visiting the battlefields of France, luxurious automobile trailer hotels have been provided in which six persons can live conveniently.

The race between the Gloucester schooner Esperanto and the Nova Scotian fisherman Delawana was different from the American cup race in that the hardy sailors of the fisher boats prayed for wind, and more wind.

Freight train operation is more costly than that of passenger trains.

The State Department, swamped by appeals to consuls in Europe for assistance to Americans stranded there, has issued a statement advising Americans to take plenty of money when they make a journey abroad.

William S. Benton, a British subject, was killed by Villistas in Mexico. The Mexican Government has agreed to pay his widow $10,000 and $2.50 a day pension as long as she remains unmarried.

Hundreds of tons of foodstuffs have been dumped into the sea at Havana due to congestion on the wharves.

Hog Island shipyard at Philadelphia, which cost the government $70,000,000, was offered for sale and brought $4,000,000 as the highest bid. The yard will be closed February 1, 1921, and will be held until better business conditions bring bids more in keeping with its value.

Dueling has been legalized by the legislature of Uruguay.

Omaha, Nebraska, has had its first arrest on a charge of "reckless aviation." A flyer who was charged with disturbing the peace by flying very low through the business district was let off with a warning that the next time he would be fined.

After fifteen years of waiting the great memorial to General U. S. Grant in the botanical gardens at Washington is to be dedicated next spring. The memorial, which contains great bronze groups of many arms of the military service, is one of the largest in the world.

Governor W. P. Hobby, of Texas, will go to Mexico City to attend the inauguration of President Obregon, December 1. President Obregon recently visited several states of the Southwest as the guest of the governors.

In Japan the police have the power to grant divorces.

The only persons able to vote without a struggle in Chicago were expert paper hangers. The ballot was nearly a yard square.

Emperor Wilhelm continues to buy only German goods when possible.

By a clause in a special treaty concluded soon after the first Punjab war the maharajah of Kashmir has the right—which he exercises—of prohibiting the importation into his territories of pork pies.

Field Marshal Lord Haig, who led the British armies in France, was Gold Stick-in-Waiting on King George during October.

The oldest occupied dwelling in the United States is at Santa Fe, New Mexico.

Eddie Guerin, who escaped from the French penal colony of Devil's Island, is under arrest in London on a charge of picking pockets and assaulting the police. Guerin was sent to Devil's Island for life after a Paris bank robbery in 1901.

J. W. Patterson, said to be the tallest man in the United States, died at Texarkana, Texas. He stood seven feet five inches.

Nome, Alaska, center of the gold rush of 1900, when it had a population of 15,000, now has only 200 inhabitants.

Omoto-kyo, a new Japanese mystic religion, proclaims the approaching end of the world.

The much disputed question of the carrying of ammunition aboard the Lusitania when it was sunk by a German submarine has been revived by the statement of Dudley Field Malone, former collector of the port of New York who checked the ship's cargo on her last voyage, that there was aboard 4,200 cases of cartridges for England, or a total of 11 tons of black powder. The Lusitania was not armed, Mr. Malone said.

Owing to overcrowded conditions in the Washington, D. C., schools, a plan is being considered to use motion picture theaters of the city as classrooms.

Warren G. Harding, president-elect, made 171 speeches during his campaign.

The housing problem in Mexico is so acute that the cities of Tampico and Vera Cruz are considering the use of knockdown houses as a temporary relief.

There were three deaths to two births in France last year.

English churches are allowing films of a religious nature to be shown to their congregations.

Successful experiments upon 59 persons suffering from leprosy led officials of the United States Public Health Service to believe that they have at last found a cure for that disease.

Knut Hamsun, Norwegian author, who won the 1920 Nobel Prize for literature, was formerly a conductor on the old Halsted street horse car line in Chicago in the early eighties.

Lenin anticipates a sudden collapse of the Soviet by keeping six automobiles at the Kremlin gates for escape when the storm breaks, according to reports from Copenhagen.

The crops of Poland this year will be but 60 per cent of normal as over half of them are in raided lands.

The French nation is facing a period of economic difficulties because the fever of speculation has not abated and other elements, such as the uncertainty of reparations payments, political war clouds and the budget, have combined in prolonging the abnormal conditions.

The roots of violet plants are used for fuel in China.

A woman in Iowa, 93 years of age, not content with the novelty of voting for the first time, sent her absent voter's ballot by airplane from Pasadena, California.

Plans to put a set of boxing gloves in every Chicago school for the use of pupils are being made by the chairman of the finance committee of the board of education of that city.

The National Consumers' League will hold its twenty-fifth annual meeting in Philadelphia this month. Prominent speakers will discuss cost of living problems.

By the Year *One Dollar* | Dearborn, Michigan, November 20, 1920 | Single Copy *Five Cents*

Prospects of a Church Reunion in England

War has made denominations increasingly conscious of their divisions, and clergy feeling growth of indifference are attempting welding.

Louisiana Will Have World's Largest Zoo

Thousands of acres have been set aside for the maintenance of a refuge for things of the land and air, where they may live, unhunted and unharried.

America's Dreadful Waste of Infant Life

A study of Mortality rates in the United States reveals that community and economic conditions are chief factors. Interesting charts are used to illustrate the situation.

The High and Low of Jewish Money Power

Herewith is presented a brief survey of both ends of Jewish influence in Wall Street, a discussion ranging from legitimate banking to large thefts of Liberty bonds.

Census of 1920 Bespeaks a Sound America

Great shifting from country to city declared not to be alarming, as result of analysis of figures from one hundred agricultural counties and comparison with conditions in 1910.

Trespassing on Burroughs

A story in which the gentle octogenarian and an unexpected visitor "talk of many things."

Many Noteworthy Features

There are of course "Mr. Ford's Page," editorials, sparkling short features and illustrations.

A Novelist of the Screen

Relating the novel work of a writer who, like thousands of others, has gone into the films.

Many Men of Many Minds

Henry McBride.—Painters in America have grievous cause for quarrel with the writers of America and are strangely patient under it. I refer to the indifference of the writers to the studio output, an indifference so complete that it would be insolent were it not also weak. To be sure Americans of all sorts are indifferent to this output but that only makes the crime of the writers—who have less excuse than our pork packers for burying their talents in a napkin—the more aggravating.

Henry de Man.—World-citizenship is a state of mind. As the ideal of a cultured minority, it is as old as Christianity. It is not incompatible with patriotism. The beginning of world-citizenship is—citizenship.

L. Ames Brown.—The scientific facts against the use of tobacco by young persons are overwhelming.

H. G. Wells.—The victor in the next great war will be bombed from the air, starved, and depleted almost as much as the loser. His victory will be no easy one; it will be a triumph of the exhausted and dying over the dead. Unless mankind can eliminate or control its pugnacity, no other prospect seems open to us but decadence, at least to such a level of barbarism as to lose and forget again all the scientific and industrial achievements of our present age.

Next War Victor Will Suffer Nearly as Much as Loser

J. C. Long.—The farmer of today affords the best clothes, subscribes to the foremost magazines, comes into town to see the latest show, knows more about the League of Nations than does the State Department, and snaps his fingers at the erstwhile wax-mustached villain who used to hold the fatal mortgage.

Carl Akeley, naturalist.—The comparatively few men who have tried to study the elephant have not gained as much knowledge as you would imagine they would, because until you've tried it you can't realize how extremely difficult it is to study the live African elephant.

Lothrop Stoddard.—Not merely by theoretic preachment, but by sustained practice, by consistent conduct extending over decades, the Scandinavian nations give the world a concrete example of a group of nations settling fundamental disputes without war, in a spirit of reasonable fairness and with increasing friendship and co-operation.

Eleanor Beers Lestrade.—In the heart of the South American forest, in a region that is called by the natives "Behind God's Back," is a waterfall that for its width is the highest in the world, but as the trip from Georgetown, British Guiana—the nearest point of civilization—is long and difficult, it has not been seen by more than a hundred white men, and, at the most, ten white women.

F. A. McKenzie.—Japan has re-created a spirit of nationality among the Korean people, and by her very harshness has tempered that spirit into a deadly weapon against herself. She has destroyed liberty. She has the country one great prison.

President-elect Warren G. Harding.—We must put our postal service upon a new basis.

Carl Dientsbach.—Mathematicians once maintained that it was impossible to carry the size of an airplane beyond certain definite dimensions—dimensions dictated by theory. Why? Because the weights increase as the cubes of the similar dimensions, while the areas of the supporting surfaces increase only as the square. The ratio of weight to area increases as the linear dimensions until the point is reached where the machine will not fly. How came the mathematicians to be in error? They forgot that the most sacred law of the cube held good only when a large airplane was a geometrical copy of a small one. When an airplane is so designed that it is *not* a copy of a small one, there appears to be no limit to the size it may reach. When this was proved, the law of the cube vanished in the wake of many other scientific superstitions.

How Big a Plane Can Be Built? No Limit, He Says

Sir Auckland Geddes, British ambassador to the United States.—The British Government will welcome the co-operation of the Government of the United States in dealing with the problems of the East and the West and that so far as trade is concerned it stands today by its old policy of fair trade and equal opportunity.

Homer L. Ferguson, president of Newport News Shipbuilding and Dry Dock Company.—A successful man is a man who, without more than a reasonable and average breaking of luck, attains an honorable and respected position in *whatever* line he goes into. I do not define success as the ability to accumulate a large amount of money. It happens practically without exception that the successful man *does* get all of the money that he needs or wants to have; but since the earning capacities of various vocations differ markedly, it is wholly unfair to measure success by a money standard.

David Lloyd George.—What the government is offering to Ireland is partnership in the greatest empire the world ever has known, at the height of its power.

Brander Matthews.—When all is said that needs to be said and when we have set up a few score Americanisms over against a few score Briticisms, we cannot help seeing that the divergences between British English and American English are relatively very few, if only we keep in mind the immense vocabulary of our ever-expanding language.

Charles S. Barrett, president of the National Farmers Union.—Under the governmental urge to feed the hunger-stricken people of the world, our farmers, at enormous sacrifices of both money and labor, endeavored to produce adequate crops this year. Despite this fact, the farmers have been forced to bear the brunt of a deflation policy instituted by the government, a policy which is the basis of the farmers' present financial troubles.

Hsu Un Yuen, councilor, Chinese Cabinet.—There exists a friendly spirit between the people of China and America that is found between the peoples of few nations.

Professor A. S. Pearse.—What a scientist, and particularly a zoologist, has as a reward for choosing poverty is freedom—for gaining a place among his own kind, for thought, for spreading ideas, for new discoveries. To those with scientific instincts, nothing could pay for the loss of this. The minister has the satisfaction of doing good, but is a slave to his creed; a lawyer may be great and good, but in the last analysis makes his living from the troubles of his fellows; the physician does good and makes money, but leads an harassed life at the beck and call of his patients; the banker has easy hours, may do good and become wealthy, but must lead a mean, penny-pinching, sordid existence at best. To those who prize free minds—Ho for the life of the scientist! Poverty be—withstood!

Why the Life of a Scientist Is to Be Preferred

Henry Van Dyke.—Democracy is a word variously employed. It signifies a government, a theory, a way of living, and (like Boston) a state of mind.

F. W. Galbraith, Jr., national commander, American Legion.—Disabled soldiers are regarded as mere cases. They appear to be sheaves of papers rather than the nation's heroes.

Thomas A. Edison.—If we are to make any real progress in psychic investigation, we must do it with scientific apparatus and in a scientific manner, just as we do in medicine, electricity, chemistry, and other fields. I purpose to furnish pyschic investigators with an apparatus which will give a scientific aspect to their work.

William Jennings Bryan.—The President should resign and turn over his office to Mr. Marshall, on the condition that on the convening of Congress in December, Mr. Marshall appoint Senator Harding Secretary of State and himself resign. The law then would make Mr. Harding President and with the Republican support in Congress, he could at once put into operation the plan for the United States to enter into an association of nations for peace.

William G. McAdoo.—Under our political system, it is always better to have one party control at Washington than to have divided authority.

James B. Forgan, president of the First National Bank of Chicago.—If a man is promoted solely on seniority, he is worth exactly the market rate in his locality for such a position. Not a cent more! For he has put himself into the class of a *marketable commodity,* instead of into a *personality* class. He has no trade-mark which sets him apart from the common run of men in his position. A commodity can be bought and sold in the market. But if you get out of the commodity class, by demonstrating that you possess individual abilities—such as exceptional thoroughness, or unusual industry, or uncommon initiative—then you become a specialty. And, as such, you can, in effect, fix your own salary.

Dr. Wesley C. Mitchell, statistician.—We are now blaming ourselves for our absurd performances in 1919. They were absurd; but what we did in that year of madness the whole world was doing—several of the nations on a more extravagant scale than ours. The recovery from this fit will also be an international spectacle and its consequences of price reductions, liquidations, bankruptcies and—let us hope—eventual resumption of hard work at making useful goods will run their course over all the continents.

What the Year of Madness Will Bring in Its Wake

Edith R. Spaulding, M. D.—It is interesting to watch a child who is taken up each time he cries. The smile of perfect contentment and satisfaction that glows in his face when this means of quieting him is resorted to is sufficient evidence of the cause of his crying and of the satisfactory fulfillment of his desires. Such constant yielding to his wishes upsets the balance of his life.

Enrico Malatesta, Italian revolutionist.—Why should I kill kings? I would sooner kill chickens, for chickens are good to eat. But kings, of what use are they?

Sir Anthony Hope Hawkins.—If society were once freed of militarism and of grind-poverty, what a difference on the earth! Then we might hope, without foolishness, that in time all other things would be added unto us.

Stephane Lauzanne, editor-in-chief of *Le Matin.*—France today does not want to hear any talk of parleys with the Soviets. It is a question, I would almost say, of religion. France believes in the religion of property, and the Soviets wish to destroy property. France believes in the religion of the sovereignty of the people and of the equality of the citizens; the Soviets recognize only the sovereignty of a small class of laborers and intend to make the nine-tenths of the citizens slaves of the last tenth. No business, no compromise with that. One may come to terms about a debt, one may compromise on a payment; but one cannot come to terms or compromise on a principle.

Dr. Charles Aubrey Eaton.—What we are coming to in the modern world is a form of personal distinction which results from high quality of character and mind rather than from clothes, cash or the ability to make a loud noise.

Dr. E. J. Dillon.—Alvaro Obregon, is not only the most distinguished and influential representative—he is to a noteworthy extent the creator of those moral and intellectual forces still widely scattered and seemingly inadequate, which appear destined ultimately to save Mexico from the irreparable ruin into which it was gradually sinking. He stands on a higher moral and intellectual level than his race. He is endowed in a greater degree with those special aptitudes which distinguish the people of the United States, and in addition he displays some of the most valuable traits of the Mexican race.

Obregon Pictured as Man Able to Save Mexico

Professor W. B. Pillsbury, psychologist at University of Michigan.—Cold feet may induce a dream of walking barefoot through snow; a dog shaking the bed may start a dream of a storm at sea.

The Census Bespeaks a Sound America

A CHANGE in the domiciliary status of William Y. Saunders of, we'll say, Cross Corners, Nebraska, is causing the "whither-are-we-trending" economists to suffer from brain fag. It seems that Mr. Saunders and Mrs. Saunders and the little Saunderses were not found on the old Saunders homestead when the census taker called in January of this year. Inasmuch as they were there in 1910 and in 1900 and maybe on numerous preceding decennial years, their absence this year caused quite a shock.

Failure to find the Saunders family in its old rural haunt inspires many to wonder if agricultural life isn't shrinking to the point whereby our food supply may be threatened in the not far distant future. For so many Saunders families and other families failed to answer from "real country" farms the roll call of the census that, it seems, undisputed farm population will show a decrease in the 1920 census returns.

The explanation probably is that William Y. Saunders has merely moved to town, where his children can attend better schools and his wife reach a more prosperous church than were available to them in the country. Very likely he is just as much a farmer as ever and is contributing just as much, probably more, to agricultural production than he ever did. The fact that he has moved to town, from which by reason perhaps of an automobile and good roads he can yet direct his farm, may reflect more favorably than disfavorably on the condition and state of agricultural life in these United States in the year of 1920.

That American farming life is tending somewhat toward converging in towns and villages, that agricultural production is keeping apace with demand despite an apparent decrease in "real country" population and tremendous increase in "urban" population—that, succintly, American life is still sound and distributed on a healthy basis, no matter what changes have come about, are among the things which United States Census tabulations to date clearly reveal.

Yet the changes which tabulations to date show or suggest are intensely interesting and in many ways they are of exceeding importance. The growth of population shown for the last ten years is rather under expectations. Instead of there being at least one hundred and ten millions of us, as nearly everybody expected, we number only a little more than a hundred and five and one-half millions. The rate of increase in total population was less than for several previous census periods. For the first time in our history, American population failed to double during the last thirty years because of decline in rate of growth during the last ten years. This is attributed by the census people to the effect of the war in cutting off immigration and, in slight measure, to the epidemics of influenza which ran up the death rate for a year or two.

The growth of population is less significant than the changes in its distribution which the 1920 census is showing. The most puzzling change is in that division defined by the Census Bureau as "urban" and "rural." By "urban population" the bureau means all those people who live in towns and cities of 2,500 or more inhabitants. That type of our population has grown either tremendously or outrageously, depending upon whether you are a pessimist or optimist. It now clearly constitutes more than one-half of all our population. More than twelve million Americans now live in "urban" territory than so lived in 1910. The rate of growth was 28.6 per cent for the last ten years. By "rural population" the Census Bureau means all those people who live in towns and villages of less than 2,500 inhabitants and the open spaces of unrestricted and unincorporated "real country." They constitute only 48.1 per cent of the total population, and show a growth of only 3.1 per cent during the last ten years. But if we eliminate all incorporated communities and consider "real country" only, we find that the undisputed farm population has actually decreased. Preliminary figures issued by the Census Bureau show that 227,355 fewer persons actually live in pure rural territory than so lived in 1910; and that that type of population constitutes only 38.8 per cent of all.

From those figures the pessimistically inclined may draw very gloomy deductions as to the future. Superficially, they would indicate that mouths to be fed are increasing, though not so fast as of yore, quite rapidly, while hands for producing food to fill those mouths are decreasing. If the analysis were correct there could be but one meaning, scarcer and costlier food and other farm products. But such an analysis isn't necessarily correct, nor even nearly correct.

In the first place, as in the case of the Saunders family we have noted, more farmers have probably left the farms than have quit farming. And each person engaged in farming is producing more than ever before, with prospect of continued and accelerated increase. This latter circumstance no doubt accounts for much of the shifting of farm population to the cities, that is to say, the farms do not need so many hands as in the day when farm machinery lent less aid than it does now in producing crops.

No doubt, however, there were other and less healthy causes for some shifting of population cityward, for example, high wages. But since the census was taken, many of those causes are not operating so forcefully as they did. It is now the opinion of some agricultural department experts that the trend of population is now actually from city to country.

The trend of farmers toward the more comfortable life afforded by the urban community is shown by the substantial growth in the population of those villages and towns that are so small as to be classed with rural territory. They show an increase of nearly two millions, or 21.5 per cent, constituting a total population that now comprises nearly 10 per cent of all the people in the country.

While there was great shifting of population as between sections, particularly in the direction of industrial areas affected by the war, there were no changes in that direction which seem to forebode any serious national problems, unless it be the extraordinary growth of the very large cities. There are no such radical state gains as were shown in 1910 when three states recorded population increases of more than 100 per cent. In fact, the largest percentage gain made by a state during the last census period is 63.1 for Arizona. New York state shows a gain of only 13.9 per cent, and that of New Jersey, a characteristically "industrial" state, gained only 24.4 per cent. Pennsylvania, another "industrial state" gained only 13.8 per cent, and California gained 44.1 per cent. Only three states show decreases, Mississippi, Nevada and Utah, and in each case the decrease is small.

It is not very difficult to explain the census figures on total population. It is quite difficult to explain those on the number of farms found in operation when the figures were gathered last January. They show that there has been only a slight gain in farms. This was a great surprise to the best experts, even those in the United States Department of Agriculture. They were confident the 1920 census would show at least 7,000,000 operating American farms, while it actually shows only 6,459,998, against 6,361,502 in 1910 and 5,737,372 in 1900. Heretofore American farms have increased in number at the rate of about one per cent a year, while for all of the last ten years the increase was only 1.5 per cent.

One-half the states actually show decreases in the number of farms. It is significant, too, that no one of those that showed decreases in 1910 now shows increases. New Mexico, which showed an increase of over 100 per cent during the first decade of the century, discloses a decrease for the last ten years. The Far West generally shows increases in the number of farms, New England shows decreases, most of the South shows increases, and in the Middle West it is a set-off between slight increase and small decrease."

Does the failure of farms to increase in number indicate larger farms? The complete figures on that item are not yet available but those which have been announced indicate that, as usual, the American farm shrank in size during the last ten years. However, the first hundred counties whose figures were tabulated report that the shrinkage was in unimproved rather than improved land. In those countries, representing nearly one-half the states, there was a small increase in the land actually under cultivation. And the shrinkage in the number as well as the size of the farms is not reflected by decrease in agricultural output. While the figures on that item are not complete, partial tabulations indicate that farm production has kept up fully with growth in the country's population. This is proven definitely for the counties and states that have been fully tabulated.

The reason production seems to have kept up in the face of a declining farm population and area is evidently because of farm machinery. All the reports show phenomenal growth in the value of farm assets grouped in "farm implements and machinery." Virtually every county tabulated shows that those values have outgrown all other farm values. It is not all due to the fact that farm implements and machinery cost more than they did ten years ago, but undoubtedly much of it is due to the fact that farms are now stocked with much more and better implements and machinery. Invariably the value of that item of farm assets is shown to have grown more than 100 per cent during the last ten years. It has outgrown even the increase in the value of land, which, however, has gained at a greater rate than was shown for the decade 1900-1910. The first 142 counties whose figures were tabulated showed increases in the value of farm lands and buildings averaging 70 per cent. They included all the counties of two New England states, where increases were small, and an undue proportion of other eastern states where farm land has not gone up so much as in other sections of the country. About one-half the counties so far reported on show increase in the value of farm lands averaging 100 per cent or more. About one-fifth shows increases of 200 per cent or more. That on the whole is a healthy sign, for if farming as an industry were in the "bad way" that other figures can be made to indicate there wouldn't be that eagerness for land that is expressed in heightening values. Yet in many localities growing values, expressed in land, have had a depressive effect on agriculture. The small farmer has been driven from many communities by inability to buy land. It is interesting to note that a compilation of figures so far disclosed on land values shows the greatest increases were in those counties, taken together, where tenantry is reported on the increase. Yet it is reassuring to note also that only about one-third of the counties report increase in tenantry.

Hence, the census figures announced to date do not give body to the probably choicest morsel constantly chewed upon by the "whither-are-we-drifting" type of agricultural economists. The returns from nearly two hundred counties may be unrepresentative, but they indicate that tenantry, instead of causing farm life in America to be dominated by absentee ownership as it is abroad, is probably declining. And in most of the country the percentage of tenants when compared with owners directing their own farms is not so large as many think.

The advances made in the use of farm machinery is reflected in substantial decline in the horse population on farms as it has declined even more decidedly in cities. In the first one hundred counties 309,620 horses were reported this year, as against 326,258 in 1910. But that ancient competitor of the horse, the mule, is not suffering in like manner. The districts that have been reported on show big increase in the mule population, which proves that despite the growing use of automobiles and tractors, the farmer is far from dis-

(Concluded on page 12)

What the First 100 Agricultural Counties Show

	Census 1920	Census 1910
Number of Farms	151,442	150,156
Acres in Farms	15,986,102	16,147,812
Improved Acreage	8,039,084	7,899,318
Number of Horses	309,620	326,258
Number of Mules	164,484	120,791
Number of Cattle	1,236,449	1,084,716
Number of Hogs	1,379,786	1,195,326
	(1919)	(1909)
Corn Acreage	49,458,275	46,152,604
	(1919)	(1909)
Wheat Acreage	9,673,204	8,323,590
	(1919)	(1909)
Oats Acreage	8,340,368	10,192,138
	(1919)	(1909)
Hay Acreage	1,690,078	1,468,772

States represented, but not in equal proportion—Arkansas, Alabama, California, Georgia, Florida, Indiana, Kentucky, Maryland, Missouri, Massachusetts, Minnesota, Nebraska, New Hampshire, North Carolina, Ohio, North Dakota, South Carolina, Tennessee, Texas, Utah, Virginia, West Virginia, Wisconsin.

Fix the Price of Coal

ANNOUNCEMENT is made by the Senate committee which has been conducting an investigation of the coal industry that unless the men responsible for the manner in which the business is conducted will reform their methods a proposal to nationalize the mines will be submitted to the next Congress. Either the price of coal must be reduced voluntarily, states the committee, or the government will find it necessary to take control of the situation.

THE DEARBORN INDEPENDENT took occasion some time ago to discuss the coal situation in this country and in doing so pointed out that there is no possible reason, except greed, for the price of coal. It was able to trace the cost of producing, shipping and marketing coal from the time it is dug out in the mines until it reaches the consumer's bin, and this revealed the fact that the financial interests which control the coal fields make three profits on every ton of coal they sell. Nor is this all, for it was also shown that the consumer, in addition to paying these three profits once, pays a tax on the ton of coal which he bought last year and the ton which he will buy next year.

How utterly ridiculous it is that a nation which produces half the coal of the world and has more than half the world's supply in its mines should be forced into a position every winter where it must submit to extortion or run the danger of freezing to death.

Senator Calder, of the committee, is declared by the newspapers to have stated that legislation will be proposed which will include price fixing at the mines. It is to be hoped that the Senator has been quoted correctly and that the committee will lose no time in carrying out its intentions when Congress is called. There is no longer much guesswork about the cost of producing a ton of coal. The government has any amount of data on the cost of production and shipping. If these are not enough Congress has access to the records of the Treasury Department, which reveal the extent of the tremendous profits piled up by the coal mine operators of late years. With these figures on hand it need not be difficult to fix a fair price. The mining interests may not like it, but they have no one to blame but themselves.

The report of the committee has also developed an interesting side issue, for it has revealed the fact that the nation is not nearly so well prepared to face the winter as has been supposed. The fact that the mines have been producing more than 2,000,000 tons a week for the past several weeks has been pointed to so frequently that a belief has arisen that there is enough coal for any emergency. Now it is admitted that these figures do not mean much because the reserve supply is low and the current demands are so great that only a small amount of the weekly production can be counted as surplus.

The mine operators say prices will undoubtedly fall soon. But the mine owners have been saying that same thing for months now and prices are still excessive. The country will know how much reliance to put in such promises and so should Congress.

A Forward Step

THERE is promise in the recent awakening of organized labor to the fact that increased wages carried beyond certain points cannot bring about a permanent amelioration of working conditions. In Baltimore twelve thousand workers in the building trades refused the hourly increase proffered, thus taking an important first step toward a restoration of pre-war prices.

The scarcity of man power caused by the raising of a huge army was such that labor in common with many employers took advantage of conditions to profiteer. The result has been prices out of all proportion to cost. These prices have begun to fall, but the readjustment cannot be complete or satisfactory if we are compelled to witness workers demanding war wages and pre-war prices for that which they consume.

Production is the chief factor in the restoration of normal conditions, and although exports admittedly are in a bad way, due to the exchange situation, continued increased output for domestic consumption will do much toward bringing about price levels that may be considered more normal than those which have obtained.

And to obtain a satisfying production necessarily there must be the co-operation of labor, whole heartedly given. It will bring a reward, a contentment that recent conditions never could hope to effect.

The Graft Disclosures

THE influence of the disclosures of graft in the building trades of New York City will not be confined to the metropolis. They will make themselves felt throughout the country in many ways and for a long time to come.

Justly or unjustly labor will suffer heavily from the impairment of public confidence. The public will not be swift to forget the tale of extortion and graft which is being drawn out on the witness stand and it will view with suspicion any future acts on the part of labor which are not so thoroughly grounded in justice that their fairness is obvious.

In disowning the grafters, labor has acted wisely but it will need to go much further than this. It will need to support the prosecution unanimously; it will have to curb its more radical members and last of all it will need to show considerable tolerance and forbearance in its dealings with the public.

Public confidence is the most valuable of all labor's weapons. Labor must hold that at any cost and it can hope to do so only by proving that such conditions as have existed in New York find no support whatever in its councils.

Out of the Depths

IN THESE times of research and invention nothing need be lost permanently. That which in the days gone by would have been considered beyond recovery may now be retrieved without great difficulty. Eric A. Dime in a late number of "Science and Invention," describes a method of raising a sunken ship, no matter in how many feet of water it may be resting.

According to the writer, huge chains are placed around the hull of the ship, to which are attached enormous air and watertight pontoons. When everything is ready, these latter are pumped full of air and the ship, with its treasure, which had been considered gone forever, rises slowly to the surface. The secrets, which for years have been buried beneath the waves, may now be brought to light, and the ship's cargo, in many cases unhurt by the action of the water, together with the vessel itself, are recovered. That which was lost had come back once more from out of the depths.

That nothing is lost beyond recovery is true in more senses than one.

A man's good reputation may have vanished overnight as the result of an indiscreet act. Years of good living may have gone for naught before the blast of an insidious enemy whose vicious tales have been believed by the multitude. Innocent words and actions may have been twisted and distorted until they conveyed a meaning entirely different from what was intended. A man's reputation may have gone to the winds, but it is not lost forever. It can be retrieved. A frank statement of the case, return to the paths of probity, an honest effort to regain the confidence of your fellow men will succeed in the end, if you don't give up hope.

Position may be lost and won again. A man's or woman's standing in the financial, mercantile or social world may totter and collapse and seem to fly away like the thistledown before the wind. That most precious of all possessions, health, may fade. Yet all is not lost.

It was Browning who said:

"Then welcome each rebuff,
That turns earth's smoothness rough,
Each sting, that bids not sit nor stand, but go."

The Salvation Army has a motto which is painted in a prominent place in all their barracks, where it will be seen upon entering the hall. It is:

"A Man May Be Down But He's Never Out."

Make that motto yours, and see how fast you will "come back."

A will to determine, faith in one's ability to accomplish, and the helping hand of another, will work wonders and bring any man or woman back from out of the depths.

California and the Japanese

AT LEAST one thing has been accomplished by the majority given to the Japanese Land Exclusion Act in California; it has convinced the nation and probably the State Department of the fact that Californians are united on the question.

There has been a vast amount of propaganda spread in the Middle West and the East by those who were opposed to the passage of this act, and one of the natural results of the circulation of these arguments was the germination of doubt concerning the real sentiment of California. The counting of the votes, however, wipes all this away. For the people of California to have carried the act by a two to one vote would have been amply sufficient to smash all arguments that the movement was a selfish one fostered only by a few interests. But when it is endorsed by a vote which seems likely to be three to one or even better, the remainder of the nation cannot fail to realize that such unanimity cannot exist where a cause is wholly without merit.

At the same time that the people of California were casting their ballots in referendum which resulted in the passage of the new law, the courts of the state declared its legality and the last possible point of weakness in the front presented by the western state was effectively shored up.

The State Department and the nation at large now have something definite upon which to stand in their consideration of the exclusion of Japanese from the ownership of agricultural lands. One, therefore, may look for definite pronouncements in the near future.

Hope Springs Eternal

THE delight, which those who still hanker for personal liquid liberty in the form of malt, spiritous or vinous liquors, feel over the recent decision of the Supreme Court seems a trifle childish. The very great majority of the American people have no stock of intoxicants hidden away and the decision which says that a man may have access to the wet goods he acquired legally before the country went dry is going to affect a very small number of people.

The rather reckless talk in which some newspapers have engaged to the effect that the decision means the release of the 45,000,000 gallons of whisky stored in bonded warehouses is not worthy of serious consideration. There is nothing in the decision which can be constructed as meaning that the Supreme Court intends to open the floodgates and drown the country in whisky.

The fact is, those who profess to see hope for the breaking of the long dry spell are merely those who want such an occurrence. The wish in this case is clearly father to the thought.

The blow struck at home brewing by the order to Federal officers to stop the sale of hops and malt should convince even those simple souls who cling to the belief that the prohibition issue is not settled, that the government is not interested in enlarging any of the fissures through which trickles of moisture are escaping.

The Shipping Expose

SENSATIONAL disclosures as to conditions which have prevailed in the Shipping Board may well match the revelations made during the war of the tragic waste in attempting to formulate the aircraft program.

Graft seems to have been part and parcel of the operations of the workers on great fleets built by America to meet conditions brought about by U-boat sinkings, and there is pleasure to be found only in the fact that there is no taint of suspicion against the executives of the board, and that, as a matter of fact, Admiral Benson, the present head of the board, in no wise was responsible or able to thwart that which already had existed when he entered office.

So far-reaching is the report, and so many are the ramifications of the enterprises engaged in by those who were given employment, that at times the amazing statements reach the ludicrous. The report about the ship that was stolen by its skipper, and is now up for sale on the west coast of Africa, is well-nigh beyond belief.

It is to be hoped that the investigation by the congressional committees will be continued until every angle of the situation has been brought to light, and those who permitted such things to come about, be named.

And, too, we may inquire further into the wooden-ship proposition with profit. There are scores anchored end to end in various harbors in the country, and no use can be found for them. Also, there have been no purchasers. Is it possible that there are persons who are waiting for conditions even more favorable to take over this vast fleet?

Mr. Ford's Page

ONE of the American poets has a line which runs somewhat like this—"All of good the past hath had, remains to make our own time glad." He probably had his own special thought about that fact when he wrote the words, and being a poet it is quite likely that some aspects of the truth, or illustrations of it, did not occur to him. But the heart of any great utterance, the quality that makes it live, is its element of truth. And many a truth is uttered, the full meaning of which is not comprehended by him to whom it is given to utter it. There is a prophetic element in truth—the future keeps fulfilling it.

If you begin even at so common a point as house furnishing, the poet's line still holds good. There was something about the old-fashioned furniture that not only satisfied the demand of utility but also satisfied the eye. The old chairs were not only strong and comfortable, but because they were that they were graceful also. They were pleasant to look upon as well as rest upon. They became "old-fashioned" in the eyes of a succeeding generation, and were displaced by strange designs which were often neither useful nor ornamental. But now, do you notice, they are coming back, the old-fashioned rocking chairs, the old-fashioned straight chairs, the old-fashioned sofas and the old-fashioned tables. And for no other reason than that they satisfy better than the new-fashioned ones.

This is perhaps more generally noticeable in the return of fireplaces. It was once the fashion to board up the fireplaces in old-fashioned homes and "paper" over the space. Stoves were all the style. Stoves, of course, are useful, but people like to see the fire. Children love to see the "eyes of fire" shining through the sliding front doors of the kitchen cookstove. Adults like the sight of fire in the old-fashioned "self-feeder," now rechristened the "base-burner."

But none of these satisfy like the free leaping flames of the fireplace, and it is becoming quite the custom in many parts to build even the smaller homes with fireplaces. Our contact with fire is about the only natural contact we can keep in our city life. Fire is elemental. Fire is common to the earth beneath and the stars and suns above. We feel united again to the natural order in the presence of domestic fire. Simply to look at it—how it draws our gaze, how it fascinates us into dreams and visions!

There is a passage in the Bible which says all this in a few words: "I am warm; I have *seen* the fire." The very sight of fire, domestic fire, is comfortable both to the spirit and the body. The fireplace is coming back because it is one of the good things of the past which the present is not willing to let disappear.

It is so with wheels. In the earlier days everyone, or nearly every family, had its own conveyance. It was so much a necessity, a family necessity, that no one thought of it as a luxury. Animals were cheap, conveyances were easily constructed.

Then with the invention of steam transportation and the growth of cities, individual conveyances began to decrease in number, so much so that in England the term "gigman," or a man who owned a gig, was descriptive of aristocracy. Until a few years ago everyone, except a comparative few in the whole population, traveled by train or street car. And although the railway did a great deal toward diminishing the greater distances, it tended to increase the lesser distances. The intercommunication of the community was decreased. People could not so easily get about their immediate environment. It became difficult even to cross the space of a city. Wheels for local conveyance became fewer and fewer.

But once more the world is on wheels, and it will never get off them again. Individual and family transportation is not only a nation-wide but a world-wide fact. Instead of there being less wheels under personal direction in the future, there will be more and better ones. What the past found good and necessary, the present is finding good and necessary, and it will be the same in the future.

So, you could go through the whole round of daily living and find the old things coming back. We are even going back to the use of water power to a greater extent than ever our forbears did. It may be that we shall sometime find many of the old-time domestic arts return to the household. What an influence for good it would have on trade at large if the households of the land learned again what constitutes good quality in clothing and food. We are being clothed with shoddy because we do not know how to identify good quality in the goods we buy. Our mothers could run their fingers over a piece of cloth and tell to the thread what constituted it. They were good buyers because they knew material qualities. But since the household arts have disappeared, we are at the mercy of the adulterator in foods and fabrics and other manufactured materials. Who knows but that the spinning wheel may yet return alongside the fireplace, the old settle, and the family conveyance? Who knows but that the family bake oven will return also? One thing is quite clear, if there were more of the art of baking bread in the land, the price of bread would more nearly conform to the price of wheat than it does now. But this phase of return to the old ways awaits a period of invention which will put at the disposal of the housewife the same improvements which have come to pass in other fields. We may yet see contrivances appear which will make the household more a self-sustaining community than it now is. Contrivances that shall separate the work from the drudgery will revolutionize the work of housekeeping, as they have done in other fields.

One former practice ought to come back at once, and that is the good old-fashioned habit of providing for the winter. All-the-year-round industrialism has had a tendency to make us an improvident folk in this regard. The fervor of the old-time Thanksgiving arose from the fact that men could see their winter provisions ahead of them. They had a feeling of snugness and security. The woodpiles were ample, the cellar was stored with the substantial necessities of life. There was no dread of the ordinary preventable lacks of supply.

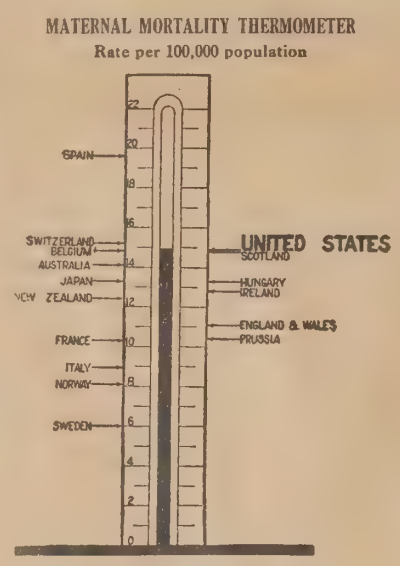
It would seem that this practice is well worth restoring and preserving. It is an undeniable fact that although we live in cities, although we have largely left the agricultural field, we are still affected by the seasons, just as it is true that although we have practically abolished night from our cities, we are still affected by the night. Civilization has not abolished winter in the least, only a few of its physical discomforts.

We should be approaching the winter in a better frame of mind if we could think of all the families of the country as well provided against their winter needs. If we could feel today, in looking abroad on our country and the world, that like the bees and the squirrels, the families of the earth had kept winter in mind all through the allurements to summer extravagance, and had fortified themselves against the slackness and needs of winter, it would generate a spirit of thankfulness which would be entirely purged of selfishness and would itself constitute a hymn of happiness.

The old ways were not so foolish after all. They met the old necessities, and the old necessities are with us yet. Life is a business to be managed, and a great many people are "poor managers." This is not because they cannot be anything else, but simply because they have not grasped the idea that life is to be *managed*. The home is a little corporation in itself and needs something of the wise foresight, the wise repression of unprofitable impulses which keep other institutions solvent and afloat.

The old industry, the old thrift, the old preference of the necessary rather than the unnecessary, will help bring back something of the old material security.

IF A thing is old, it is a sign that it was fit to live. Old families, old customs, old styles survive because they are fit to survive. We notice it now in the return of the old styles in furniture: utility and beauty were more perfectly blended in the furniture of our fathers than in the gingerbread fashions which succeeded them. The old-fashioned fireplace is returning also. The closed fire is a good thing and will survive; but the open fire is good too, and is coming back by tens of thousands every building season. Old-fashioned hospitality ought to come back, and old-fashioned politeness and honor. And the very wise habit of imitating the squirrels, and laying by in store for the winter. It would be a much happier Thanksgiving if we could know that everyone was stocked up against the needs of winter.



America's Dreadful Waste of Infant Life

A Study of United States Mortality Rates Reveals That Community and Economic Conditions Are Chief Factors

By AARON HARDY ULM

IN ONE of the last addresses made to members of the medical profession, General Gorgas, the army surgeon who in his work at Panama showed how the tropics can be made healthful, scarcely mentioned medicine and sanitation. He talked tax reform. He made the assertion that the application of a certain radical change in imposing taxes would do more for general health than perhaps all research work regarding germs and antitoxins that have been or will ever be made. The reform he said would relieve economic and social pressures that have more to do with producing bad health than do the specific diseases that cause ill health. In particular, he argued, the tax reform in question would have on housing an effect that alone would add immensely to the health and average length of life of the people of the country.

What he said regarding the predisposing causes of ill health and shortened lives among all the people is perhaps many times more applicable to illness and mortality among infants. A study of infant mortality brings one to the inevitable conclusion that the numbers of infants that die in proportion to the numbers that are born are governed more by community factors and economic conditions than by the bacilli and bacteria that are the immediate causes of most of the diseases from which infants die.

The United States lost over 16,000 women in 1916. We have a higher maternal death rate than any other of the principal countries except Spain or Switzerland.

Children's Bureau, U. S. Department of Labor.

"A baby that comes into the world has less chance to live one week than an old man of 90, and less chance to live a year than one of 80," says Bergeron. And that high risk of death is not in the case of babies due to inherent natural conditions as in the case of old men. Of course a certain percentage of babies are doomed to early death by inherent weaknesses, in part due to causes that perhaps cannot be overcome. But authorities hold that Nature strains every possible point to give every baby a fair chance to live. Some go so far as to assert that even the condition of the mother has little to do with the new-born baby's strength, that Nature will always sacrifice the mother on behalf of the infant. Hence those authorities maintain that babies of all classes, that is, of well nourished as well as poorly nourished mothers or leisure-laden as well as burden-laden mothers, are equally strong and vigorous at birth. But others assert that Nature cannot or does not go that far, and that, while Nature does her best, the condition and the environment of the mother have much to do with the infant's start in life.

Whatever the causes and the ultimate meaning of the high mortality among infants, it has been clearly demonstrated that, in this country and most other countries, it is much higher than it would be in a reasonably perfect order of society. In fact, students of the subject say that infant mortality in the United States is more than twice as great as it should be. That is to say, about 150,000 more babies die within the first year than should be the case.

Despite our habit of boasting of the superiority of our country over all others, statistics show that several other countries have lower infant mortality rates, which the authorities agree are the best available barometers of the true happiness, well-being and future outlook of a country and a people.

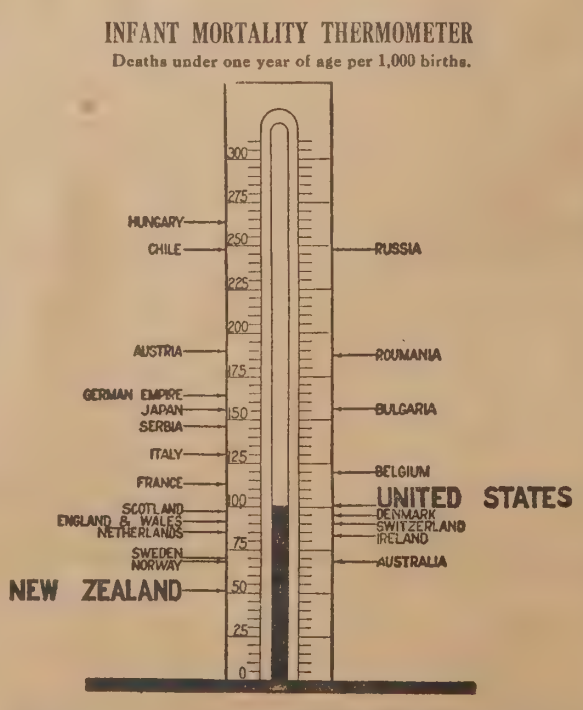
In New Zealand only fifty of every 1,000 children born die before they are a year old. In the birth and death registration area of this country the infant mortality rate is about double that of New Zealand. For the entire country it is probably higher. In 1910 it was estimated at 124, but undoubtedly there has been substantial reduction. Sweden, Norway, Ireland and Australia all have lower infant mortality rates than the United States, whose rate is much lower, however, than those of many other countries. Chile, if we omit heightened European rates caused by the war, leads with a rate of about 300. Russia has a rate of more than 200. In some parts of China and India the infant mortality rate is more than 500. *Only one of every two children born ever see a birthday anniversary.*

One cannot escape the impression that the infant mortality rates of different countries run somewhat parallel with the various countries' reputations for progress and the economic well-being, intelligence and character of their inhabitants. And if you examine the rates for various localities in the United States you will be impressed with a like comparison.

The infant mortality rate does not run evenly for all parts of the United States. In one notable city it was only 41 for 1919. It is of some significance that the city in question—Brookline, Massachusetts—contains a population that ranks first in the country for average wealth. And Brookline is noted for its culture, too. Another city, El Paso, Texas, reports a rate of 245 for 1919. It is due perhaps to a large Mexican population. Burlington, Vermont, with a total population similar in size to that of Brookline and also of similar climate, reports a rate of 150. Many other cities, large and small, show rates exceeding 100. Minnesota has the lowest rate for any state.

Differences in infant mortality rates are due in only small part to variations in climate; in fact, it is questioned whether climate has any kind of direct influence on the matter.

There is wide disagreement as to the relative importance of the numerous "causes" that are believed to affect infant mortality. At best, the students of the subject know only what phenomena go hand in hand, as a rule, with high rates, and what phenomena are absent when there are low rates. That phenomena bear upon all the equations of living existence. The experts are coming more and more to believe that things which can be controlled only by community action have more to do with the situation than the things that can be controlled within the home.



"Infant mortality is the most sensitive index we possess of social welfare and efficient sanitary administration, especially under urban conditions," says Sir Arthur Newsholme, perhaps the greatest authority on the subject.

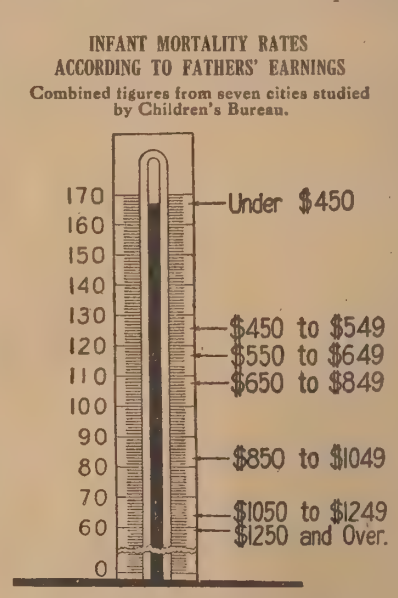
Surveys made by the United States Children's Bureau, under the direction of Miss Julia Lathrop, its director, show that infant mortality is even a more far-reaching "index" than indicated by the famous British expert.

Those surveys consisted of sending expert investigators into different cities, where first-hand inquiry was made with regard to the history of every child born in the city within twelve months. House to house canvasses of homes were made and mothers were examined not as to births and deaths of offspring but as to every environmental condition.

The statistics show, when analyzed, many surprising conditions. Among other facts they prove that infant mortality rates run almost parallel with the incomes of fathers. For Baltimore families, where the fathers earned less than $550 a year—the figures are for 1915—the infant mortality rate was 288.6. For those where the fathers earned between $550 and $849 it was 178.3, decreasing with increase of income until the rate fell below 50 for infants born to mothers whose husbands earned $2,000 or more a year. Baltimore is the largest city that has been surveyed, but like parallel—though the percentages vary—between the rate of infant deaths and family income was found in all. Investigations made in Germany and Great Britain show a similar parallel, the figures often being more extreme than those for America.

There was like parallel between the infant mortality rate and all those things which income usually reflects. In Johnstown, Pennsylvania, the rate for houses into which water was piped was 117.6; in houses that depended for water on wells and pumps it was 197.9. In streets where there were sewers the rate was higher than where there were none. In one city it was found that for babies born in homes that contained bath-tubs the mortality rate was only 72.6; for those born in homes without bath-tubs it was more than double, or 197.9.

Within the first year after birth, the United States loses 1 in 10 of all babies born. It ranks eleventh among the principal countries of the world. New Zealand loses fewer babies than any other country.



Rates are for latest available years up to 1916.

Children's Bureau, U. S. Department of Labor.

When the figures were arranged by different localities in cities, by wards usually, a clear divergence reflecting the character and tone of the sections of the same community was shown. In the slum sections it is always highest, in the select communities always the lowest.

Where mothers were wage earners before the births of the children, the infant mortality rate is always higher than for other women of the same class; when they work out after the babies are born the death rate is still higher.

Among foreign-born mothers it is invariably higher than among white natives; among foreign mothers who can't speak English it is higher still; among those who can't read and write a further increase is found. And there are like differences between death rates for infants born to literate and illiterate native mothers. There is wide difference of opinion as to the direct bearing of mere ignorance on the infant mortality rate. Sir Arthur Newsholme says it is very slight. "But the ignorance among the working class mothers is dangerous," says he, "because it is associated with relative helplessness.

The baby death rate rises as the fathers' earnings fall.

Children's Bureau, U. S. Department of Labor.

"What is needed is for environment of the infants of the poor to be leveled up toward that of the infants of the well-to-do and for medical advice and nursing assistance to be made available for the poor as it is for persons in higher social station."

The Children's Bureau surveys also show, incidentally, that the age of the mother and size of the family have much to do with the infant's chance of survival. The lowest rates are for mothers between 20 and 30 years old, and for the second child. Below twenty and after thirty years of age, the mother has greater risk of losing her baby in infancy, and after the second child the chances of the baby dying within one year after birth increase in proportion to the number of other children that precede it.

Housing, or rather crowding, is so clearly reflected in infant mortality that one expert ventures to say that he can approximate living conditions in a city with its infant mortality alone as data to work from. The rate rises and falls with the number of people per room living in dwellings where the little ones are born, and also in slight measure as the infant sleeps—in the same room with its parents or in an adjoining room.

Nobody can tell definitely how far government reflects itself in the infant mortality rates. Some say they are perhaps the best of indexes to the character of municipal government. For the water and milk supplies, municipal sanitation, in addition to housing laws, have immense effect on the health of babies.

"A high infant mortality rate today is a greater disgrace than a high typhoid rate," says Dr. William H. Davis, chief of the vital statistics division of the United States Census Bureau, "for a high typhoid rate may be due to one milkman's carelessness, or to the laxness of a few city officials in not properly safeguarding the water supply or the milk supply. But a high infant mortality rate reflects upon the clergy, the physicians and nurses, the school-teachers and editors . . . . it reflects upon the intelligence of the people."

Yet Dr. Davis belongs to the group of experts that discount the direct effect of even poverty—the least disputed of all "causes"—on infant mortality.

"Extreme poverty may be an important factor in some cases but in this country the problem is largely one of education," he says. He points out that the rate of infant mortality follows that for intestinal troubles.

All experts admit the high importance of mothers feeding their babies. Much artificial feeding, of course, is due to indifference, social interests and such; but an immense amount of it is due to the economic pressure which finds worst expression in the forcing of many mothers to be wage earners before the birth or during the infancy of the child.

From whatever point you view the subject, you must arrive at the conclusion that a high infant mortality rate reflects conditions that are disgraceful to communities; for it has been proven by experience that by community action high rates can be brought down, and largely by it alone. And it isn't very expensive to the community, taking just a little concerted scientific effort to see that every baby born within the com-

Snowy herons, producers of the aigrettes of commerce.

Louisiana Will Have World's Largest Zoo

By HARRY H. DUNN

STRETCHING for approximately seventy-five miles along the coast of the Gulf of Mexico, and extending inland an average width of seven miles, an area of more than 500 square miles, the largest zoological garden in the world is being established within the boundaries of the United States, by the state of Louisiana. More than three-fifths of this great tract, larger even than the "Elephant Park" planned by England in the heart of equatorial Africa, is now owned by Louisiana under permanent law that it never be sold or leased or used for any purpose whatsoever but refuge for the wild things of the earth and air, that no firearms of any kind, save those belonging to the wardens, be allowed upon it, and that it at all times be open to ornithologists, naturalists, and nature photographers.

On these lands, all so far given to the state made famous by Audubon, all the many varieties of bird life indigenous to Louisiana are now living and increasing. On them the snowy heron, driven to the verge of extinction by the plume hunters, who took the beautiful aigrettes at the price of the bird's life, have returned to breed by thousands. The roseate spoonbill, once thought to be on its way to join the great auk and the Labrador duck in extinction, breeds there in annually increasing numbers, while during the migratory season—since this great zoo lies directly under the main lanes of Mississippi Valley migration—the photographer and student are compelled to drive the Canada and snow and blue-fronted geese and the mallards and teal and pintails from his path as he walks on Avery Island, or Marsh Island, or over the huge tract given to the state by the Rockefeller Foundation.

The present tract is administered by the Louisiana State Department of Conservation, which had the greater part of it for five years under probation, demonstrating to the donors that these islands and prairies and bays and bayous and marshes could be maintained free and safe sanctuaries for the wild life of the whole Mississippi Valley. At the end of those five years—this year these tracts are being turned over to the state of Louisiana, through the state department of conservation, to be the property of the state forever. The Louisiana legislature recently passed an act enabling the state to accept these tracts, and no sooner was this act a law than Governor John M. Parker, commissioner of conservation, M. L. Alexander, and Edward A. McIlhenny, who, nearly thirty years ago, originated the idea of the great zoo, and was the first to give land to the state for this purpose, began work on a project to obtain the remaining land to make up the solid front of 75 miles on the Gulf of Mexico.

M. L. Alexander (left) commissioner of the Louisiana State Department of Conservation, discussing an oyster with Dr. George W. Fields, oyster expert of the United States Fisheries Bureau. Mr. Alexander has complete charge of the world's largest zoo.

Lands in the zoo today consist of 13,000 acres, valued at $130,000 and given to the state by Charles Willis Ward and Edward A. McIlhenny, in 1911; 78,935 acres, valued at $780,000, given by the Russell Sage Foundation, as the result of efforts by Mr. McIlhenny, and 88,247 acres valued at $660,000, given by the Rockefeller Foundation. All these foundation gifts, as has been intimated above, were made five years ago. Thus, there is a total of 180,232 acres, valued at $1,570,000 now in the zoo.

The lands to be acquired consist of two strips, one of 43,000 acres, in Vermilion Parish, between the Russell Sage and Rockefeller Foundation gifts, and valued at $675,000, and the other of 86,000 acres lying between the Ward-McIlhenny gift and the Rockefeller Foundation gift, and valued at $300,000. As will be seen, these strips separate the present tracts, and prevent their being welded into one whole zoo. Negotiations have progressed so far and so favorably with the owners that the Louisiana state authorities are convinced they will be in possession of the lands within ten months, if not before that time.

Persons whose idea of a zoo pictures a number of huge cages filled with animals and birds would be disappointed in coming to this, the greatest zoo in the world, for there is not a vestige of a fence, far from a cage and not a house appears save at rare intervals the cottage of a warden, or the landing place of some of the armed fleet of motor boats which day and night patrol the waters of Vermilion, Cameron and Iberia parishes, through which the great wild life refuge extends. The combined tracts will take in at least three bays, three large lakes and several small ones, and a score of islands in the great marsh. They include salt water, out to the three-mile limit of Uncle Sam's domain; salt marsh lands, fresh-water marsh lands, fresh-water lakes and bayous and rivers; oak-covered islands, and cypress-covered swamps.

E. A. McILHENNY,
Originator of the wild life refuge idea.

On these lands today lives every variety of animal life known to Louisiana, from the black bear of the canebrakes to the muskrat of the river banks, and from the bald-headed eagle of the oak-covered islands to the humming bird of myriad hues flittering above the wild roses on the upland. To them in winter comes every variety of bird that migrates into or through the United States, from the tiny swallows to the huge and rare swans. Albatrosses, boobies and frigate birds have been seen on Marsh Island, which the Russell Sage Foundation gave to Louisiana, and the mysterious Anhinga, or snake bird, believed to be the most direct of all bird descendants of the flying reptiles, nests in safety, fearless of man, on the Avery Island reserve.

And it all began nearly 30 years ago when Mr. McIlhenny, then a boy on his father's large estate at Avery Island, noted the visits of the plume hunters in their great, slow-moving luggers, the decks covered with the skins of slain birds. He connected these plume hunters with the disappearance of the roseate spoonbills, the snowy herons, the American egrets, and other birds from the swamps and marshes whereon they once nested in myriads.

Selecting Willow Pond at Avery Island as a place where they would be safe, he hunted the swamps for several days until he found two nests of the snowy heron, that beautiful bird from the nesting female of which are torn the aigrettes for milady's headgear. These he reared in a large cage on the pond, and kept them tame and familiar until the time for the migration. The next year they returned, and nested, and so on ever since, flying southward to Central America and back in the spring, until today there are at least 2,500 pairs nesting on Willow Pond alone, and probably as many more pairs scattered through the remainder of the reserve.

Gradually other birds came to nest at Willow Pond, until the greatest bird colony in the world was built up there, and became, with the rising in Louisiana of men who foresaw the fate of all American wild life if its slaughter were not checked, the nucleus of the 500 square miles of natural zoological garden now being arranged in that state. A railroad runs to the border of this vast area at one point, and neither it nor any other railroad will ever be allowed to touch it anywhere else. The proposed route of the Intercoastal Canal runs for some distance along its inland boundary, and Calcaiseu Lake lies close to its western line. All these furnish natural navigable waterways by which the great zoo may be patrolled. It is estimated that, in addition to the four patrol motor boats each armed with a one-pound rifle and manned by four wardens in addition to the crew, some 150 land wardens, and five or six automobiles will be required to safeguard the zoo, more guardians being required as the wild life increases and the temptation to slaughter becomes greater.

Already there have been pitched battles between the agents of the state department of conservation and poachers, the last of which, no later than last year, was a gun fight of more than half a day between one warden and six poachers.

These Texas Rangers of the swamp, on foot, mounted on horses, riding in motor cars and clinging to the deck of a 40-foot motor boat in the rough waters of the gulf, have driven virtually every poacher from the thousands of acres comprised in the wild life refuges. Squatters, few in number, were bought off, if they had titles, or compelled to quit the state lands if they had no right to them while a few were taken into the organization as wardens, and have done efficient work there. Thus the only bars on the cage of the world's largest and most densely populated zoo will be the couple of hundred agents of the department of conservation, and its only boundaries the streams and the imaginary lines which mark its bounds on paper. There is no physical reason why the inhabitants of this bird and animal paradise should not spread from it throughout the wilder parts of Louisiana.

Picture to yourself, if you can, a place of pleasant lands, flowing streams, quiet lakes, shallow brooks, deep rivers, wide bays, all fringed and bordered and dotted with groves of oak and cypress and tulip and bamboo, meadows covered with lush grasses, hills groved with oaks that were tremendous trees when Columbus was a child in Genoa, and lay it all down in the heart of the mystic, legend-haunted country of Evangeline and Gabriel, and you will have some idea of the physical aspect of this, *your* forever free zoo. Fill it with more birds and animals than you can imagine, and you will get some faint idea of the wilderness Audubon saw when he sketched his birds.

Walk with me on Hell-Hole Bank, on Marsh Island, and literally shove the wild geese out of your way, while one hundred yards outside the unmarked boundary of this sanctuary, you could not approach within a thousand feet of the flock. Step with me into a flat-bottomed john-boat and pole through the trees where 20,000 herons are nesting, feeding their young or covering their eggs with as little attention to you and me and the click of the camera as they pay to the protected herds of deer that wander to their pool to drink.

Walk through the oaks on the knolls and hear a choir of bird voices raised in an everlasting song of thankfulness for freedom from all danger, save that of the wandering snake, or the predatory rat. Then think what all this means to the people of this America who are to come after us, when the bird life of the nation has been reduced to nothing, as the biologists tell us it will be in these United States within the next twenty years at the present rate of slaughter. How much more worth while it is now to expend the money of the state and of the United States on such a vast protected home for the living wild life, than on plate glass cases for the dead animals and birds that once flourished so bountifully on this continent!

The High and Low of Jewish Money Power

A Brief Survey of Both Ends of Jewish Influence in Wall Street: From Legitimate Banking to Large Thefts of Liberty Bonds

JEWISH high finance first touched the United States through the Rothschilds. Indeed it may be said that the United States founded the Rothschild fortune. And, as so often occurs in the tale of Jewish riches, the fortune was founded in war. The first twenty million dollars the Rothschilds ever had to speculate with was money paid for Hessian troops to fight against the American colonies.

Since that first indirect connection with American affairs, the Rothschilds have often invaded the money affairs of the country, though always by agents. None of the Rothschild sons thought it necessary to establish himself in the United States. Anselm remained in Frankfort, Solomon chose Vienna, Nathan Mayer went to London, Charles established himself in Naples, and James represented the family in Paris. These were the five war-lords of Europe for more than a generation, and their dynasty was continued by their successors.

The first Jewish agent of the Rothschilds in the United States was August Belmont, who came to the United States in 1837, and was made chairman of the Democratic National Committee at the outbreak of the Civil War. The Belmonts professed Christianity and there is today a Belmont memorial, called the Oriental Chapel, in the new Cathedral of St. John the Divine on Morningside Heights.

Rothschild power, as it was once known, has been so broadened by the entry of other banking families into governmental finance, that it must now be known not by the name of one family of Jews, but by the name of the race. Thus it is spoken of as International Jewish Finance, and its principal figures are described as International Jewish Financiers. Much of the veil of secrecy which contributed so greatly to the Rothschild power has been stripped away; war finance has been labeled for all time as "blood money"; and the mysterious magic surrounding large transactions between governments and individuals, by which individual controllers of large wealth were made the real rulers of the people, has been largely stripped away and the plain facts disclosed.

Jews in International Finance

THE Rothschild method still holds good, however, in that Jewish institutions are affiliated with their racial institutions in all foreign countries. There are Jewish banking firms in New York whose connections with firms in Frankfort, Hamburg and Dresden, as well as in London and Paris, can be traced by the mere matter of the signs over the doors. They are one.

As a leading student of financial affairs puts it, the world of high finance is largely a Jewish world because of the Jewish financier's "absence from national or patriotic illusions."

To the International Jewish Financier the ups and downs of war and peace between nations are but the changes of the world's financial market; and, as frequently the movement of stocks is manipulated for purposes of market strategy, so sometimes international relations are effected for mere financial gain.

It is known that the recent Great War was postponed several times at the behest of international financiers. If it broke out too soon, it would not involve the states which the international financiers wished to involve. Therefore, the masters of gold, that is, the international masters, were compelled several times to check the martial enthusiasm which their own propaganda had aroused. It is probably quite true, as the Jewish press alleges, that there has been discovered a Rothschild letter dated 1911 and urging the kaiser against war. The year 1911 was too early. There was no such insistence in 1914.

Not only do these foreign financial affiliations cast a different light on purely national matters affecting the peace and prestige of the peoples, but they tend toward an extra- or super-nationality. When these foreign affiliations enable Jewish bankers to excel in the more highly specialized forms of finance, such as foreign exchange, they also enable them to exercise almost complete control over international money movements.

There is no question whatever of International Jewish Finance being deeply concerned in the matters of war and revolution. This is never denied as to the past; but it is just as true of the present. The league against Napoleon, for example, was Jewish. Its headquarters were in Holland. When Napoleon invaded Holland, the headquarters were moved to Frankfort-on-the-Main. It is remarkable how many of the International Jewish Financiers have come out of Frankfort—the Rothschilds, the Schiffs, the Speyers, to name but a few. The racial affiliations running all through the world of international finance are readily recognized.

These associations produce in Jewish banking circles a constant tendency toward control or monopoly of certain lines of industry which are identified with the fields of finance. The rule is, once control is gained, all non-Jewish interests must be driven out. "Jewish financial interests have rarely been connected with industrials," says the Jewish Encyclopedia, "except as regards some of the precious stones and metals, the Rothschilds controlling mercury, Barnato Brothers and Werner, Beit & Company diamonds, and the firms of Lewisohn Brothers and Guggenheim Sons controlling copper, and to some extent silver." To this, of course, may be added whisky, wireless, theaters, the European press and part of the American, and a number of other fields. The list will be made complete in this series of articles before they are finished.

The Jewish Encyclopedia continues:

"It is, however, mainly in the direction of foreign loans that there has been any definite predominance of Jewish financiers, this being due, as before stated, to the international relations of the larger Jewish firms."

American Jews' Foreign Relations

IN ORDER that the senseless denials of certain portions of the Jewish press may be checked, it may be said that Jewish authorities do not deny such statements as are made about Jewish international financial control, although they declare it is not as strong as it once was. "Of more recent years," says the Jewish Encyclopedia, "non-Jewish financiers have learned the same cosmopolitan method, and, on the whole, the control is now rather less than more in Jewish hands than formerly."

This is true, at least as far as the United States is concerned. Previous to the war, the status of many of the Jewish financial concerns in Wall Street was stronger than it is now. The war brought about a condition which threw a new light on the internationalism of Jewish finance. During the years of American neutrality there was opportunity to observe the extent of the foreign affiliations of certain men, and also the extent to which ordinary national loyalty was subordinated to the business of international finance. The war really forced a coalition of Gentile capital on one side of the struggle, as against certain blocks of Jewish capital which were willing to play both sides. The old Rothschild maxim, "Do not put all your eggs in one basket," becomes perfectly plain when transposed into national and international terms. Jewish finance treats political parties the same—bets on them both, and so never loses. In the same way, Jewish finance never loses a war. Being on both sides, it cannot miss the winning side, and its terms of peace are sufficient to cover all advances to the side that lost. This was the significance of the great swarming of Jews at the Peace Conference.

Many of the Jewish houses on Wall Street were originally the American branches of long established houses in Germany and Austria. These international firms were accustomed to support one another with capital, and maintained other intimate associations. Some of them are linked by intermarriage. But the bond above all is the Jewish racial bond. Most of these houses received a severe setback during the war, because their over-seas associations were not of the right kind. But this setback is expected to be only temporary, and the Jewish financiers will again be ready to give battle for the entire financial control of the United States.

High-Water Mark of Jewish Control

WHETHER they will be successful, the future will decide. But a strange fatality seems to follow all forms of Jewish supremacy. Just as the capstone is ready to be placed upon the edifice of Jewish triumphs, something occurs and the structure shrinks. It occurs so often in Jewish history that the Jews themselves have been exercised to find an explanation. In many cases "anti-Semitism" offers the readiest excuse, but not always. Just at the present time, when the light which was shed by the fires of war has revealed so many matters formerly hidden in shadow, the awakening of world attention is called "anti-Semitism," and the explanation is given that "after every war the Jew becomes the scapegoat"—a curious admission which would lead a less self-centered people to inquire, Why?

But so handy and so untrustworthy an explanation as "anti-Semitism" does not account for the failure of Jewish financial interests to become absolutely dominant in a country like the United States. Anti-Semitism among the people does not surge high enough to injure those securely entrenched behind great financial influence. The silent resistance of the Wall Street financial group or of the New York Stock Exchange, for example, is not anti-Semitism. It is not a hindrance to the Jews in doing business; it is opposition to an apparent program for total control which is sought not for the general good, but for a racial benefit.

It was only a few years ago that the banking house of Kuhn, Loeb & Company was commonly regarded as being destined in the near future to win complete financial supremacy in Wall Street as an underwriting and money-lending institution. There were many reasons for this belief, among them the fact that Kuhn, Loeb & Company were the financial backers of Harriman in his terrific railroad duel with James J. Hill. But the prophecy regarding this financial institution was never realized. Untoward events intervened, in no way affecting the financial integrity of the firm, but bringing it into the light of undesirable publicity not of a financial character.

In the firm of Kuhn, Loeb & Company, Jewish finance in the United States reached its high-water mark. The head of this firm was the late Jacob Schiff, who was born in Frankfort-on-the-Main and whose father was one of the Rothschild's brokers. One of Jacob Schiff's associates, Otto Kahn, was born an Mannheim, and was early associated with the Speyers, who also originated in Frankfort-on-the-Main. Another associate, Felix Warburg, married into Jacob Schiff's family. Jewish finance has spread, but it has not risen higher than in this firm.

A flank movement, however, has been attempted which may bring Jewish ambitions nearer the goal of their desire. Checked in Wall Street, Jewish financiers have sought out other American centers, and even foreign centers whose future influence on American affairs promises to be considerable. The first flank movement is toward Central and South America. It may be said that the financial assistance, practical and advisory, offered to Mexico during the most unsatisfactory period of her relations with the United States, was given by Jewish financial groups. The attempt to gain influence with Japan seems to have come off rather badly. It is known, of course, that Jacob Schiff gave material assistance to Japan in the war with Russia. This was explainable on the ground of good business and also of a desire to revenge Russia's treatment of the Jews. Mr. Schiff used the opportunity also to instill the principles, which have since grown up into Bolshevism, into the minds of Russian prisoners in Japanese war camps. But more than that, the idea appears to have been to add the newly rising Japanese power to the string of Jewish financial conquests. Jewish finance already has a foothold in Japan, but it appears that Mr. Schiff's hopes in this respect were not fully realized. The Japanese are credited with knowing much more about "the Jewish peril" than even the United States does, and they were exceedingly wary. They kept the business deal strictly a business deal, and Mr. Schiff was said to have been displeased with Japan generally. This is well worth knowing at this time, especially in view of the propaganda which seeks constantly to cause misunderstandings to arise between the United States and the Empire of Japan.

A Flank Movement From South America

BUT South America appears to be the latest objective. It must be remembered that the Jews exercise a world control in two departments: in movements of men, and in movements of money. No government, no church, no school of thought could order the movement of 250,000, half a million, or even a million people, from one part of the world to another, shifting them as a general shifts his army, but the Jews can do that. They are doing it now. It is only a matter of ships. From Poland, where Jewish special privileges have been written into the law of the land by the all-powerful Peace Conference, and where it would seem that the Jews have every reason to remain, there is a great movement westward. It is not a stampede, as the American Commissioner of Immigration says, although it may look so from this side. It is an orderly movement, as can be seen when the American Jewish directors on the other side are observed. And part of it is being directed to South America. It is said that after a period of training in the United States, some of the immigrants who are now landing here will be shipped south again.

The other mastery which the Jews exert in a world degree is that over the movement of gold. Without giving expression to what the purpose may be, there is this to be said: a large movement of Jewish men and Jewish gold proceeds toward South America these days. And there is said to be a large movement of other materials, which when interpreted by the Protocols can mean but one thing.

The next attempt for control of the Americas may come from the South, where the Jews are already stronger than their numbers would indicate, and where their revolutionary proclivities have already come into play as between the various states.

These rebuffs and these strategic flank movements do not, however, complete the record. We are now speaking of American finance only. The Jews have not been restrained elsewhere as they have been in Wall Street. They exercise a very ominous control in a number of other fields, each of which will be taken up in detail in due time. For the present, our attention is being directed to New York and its financial district.

We have just shown the high-water mark of Jewish control as it has been reached up to date in the Street. There is another aspect of Jewish influence on the financial affairs of America which is not so flattering to that race. If Jewish financial activity does not go higher, it goes lower and finds its way into darker channels than does any other form of financial activity in the country.

The Sensational Bond-Theft Conspiracy

IT WOULD make a sordid tale, the operations of the Robins, the Lamars, the Arnsteins and the others who have contributed to the long roll of criminality produced within the shadow of Wall Street, and the only point that could be served by its retelling is that such criminality is predominantly Jewish. This is not to say that it has the approval of the Jewish community, but it is very significant that while whole volumes of abuse have been heaped upon THE DEARBORN INDEPENDENT'S very modest effort to state the status of the Jewish Question in America, the leaders of Jewry have been silent about the criminal financial operations of those who could be made to feel the displeasure of their race. The Jewish passion for the defense of the race, regardless of the degree of guilt, is well known to every prosecuting attorney, although it must be said that during the investigation made some years ago which revealed the business of commercialized vice to be under Jewish control, certain public-spirited Jews commendably aided the work. This aid, however, did not prevent the severest opposition to certain publications which gave notice of the facts which the investigators were finding.

The country was lately astounded by the revelation that stocks and Liberty bonds to the value of $12,000,000 had been lost through a systematic series of thefts in Wall Street.

Beginning with the spring of 1918, messengers sent out by New York Stock Exchange firms to make deliveries of stocks and bonds to other houses, in the course of ordinary business, began to disappear as if the earth had swallowed them up. For a time these disappearances were without explanation.

Wall Street is really a small district. Most of its business is done within the space of a city block. Messengers on their trips sometimes went only to another floor in the same building, or to an office across the street. Yet in those short trips they would disappear with all their securities, seldom to be heard of again.

Up to the summer of 1918 the absconding messenger boy was a rarity. The type was regarded with good-humored indulgence on the Street. They were generally happy-go-lucky youngsters, and the steadier heads among them graduated into clerks in the commission houses.

The labor shortage struck Wall Street, along with other sections of the country, and messenger boys were difficult to find. During this period there was also a great expansion in business. Nearly everyone in the country possessed bonds of some kind, and these changed hands in unparalleled quantities. On the floor of the Stock Exchange, daily transactions in bonds up to $20,000,000, and in stocks up to one or two million shares, were common. Following the sales, the stocks and bonds were transferred from seller to buyer by messenger boy. It was not unusual for irresponsible lads to be running from office to office in Wall Street with $250,000 each under the arms.

Then, with the shortage of boys, another type of messenger began to appear, and with this type the trouble began. Disappearances and losses became more frequent and costly. The indemnities paid by the insurance companies reached such staggering figures that the custom of issuing blanket insurance was withdrawn. Various expedients were adopted to solve the mystery; boys were required to travel in pairs, guards were posted throughout Wall Street, the best detectives in the land were assigned to the matter, but without avail.

There was a strong disinclination in Wall Street toward publishing the figures of the losses, for fear the publication might be destructive of public confidence in the Street's financial condition. But the news was known in the underworld and drew to New York criminals from all parts of the country. For a time all efforts were fruitless; the losses continued and the mystery deepened.

Then, suddenly, in the early part of 1920, certain arrests were made and confessions obtained, which disclosed one of the most amazing criminal conspiracies in the history of the United States.

There was proved the existence of a vast Jewish conspiracy to loot Wall Street. It was found that a band of astute Jewish criminals, many of them wealthy men, some of them ex-convicts, had created an organization by which Wall Street financial houses were to be plundered.

Bands of young Jews, mostly of Russian origin and living on the East Side, had been shaped into being. These lads, instructed by clever Jewish principals, applied to Wall Street messenger agencies for employment in brokerage houses. It was part of the plan for them to assume good, honest-sounding Anglo-Saxon names. The "cover name"—how often we meet it!

These lads turned over their stolen stocks and bonds to the heads of their organizations, who in turn passed the securities on to the Jewish principals, who were for the most part members of the criminal band of "confidence men" in the White Light district—the "bank-roll men," whose immunity from punishment has always been one of the standing puzzles of Gentiles residing in New York.

These Jewish criminals were aided by Jewish lawyers in their transactions. The stolen stocks and bonds were taken to Cleveland, Boston, Washington, Philadelphia and parts of Canada, where they were pledged as collateral for loans in an apparently legitimate course of business.

Low-Water Mark on the "Street"

ONE of the messenger boys refused to deliver his stolen securities for the small sum he was offered for them, and ran away to enjoy alone his ill-gotten wealth. His hiding place was discovered and members of a band of Harlem assassins were sent for him, with instructions to find where the securities were. If they were on the boy's person, he was to be killed at once. This band entertained the boy with drinks and women for several days until they learned that the securities were sewed inside the lining of his coat. They took him for a "joy-ride" into the country, and his dead body was afterward found, typically slain, with about two dozen dagger wounds in his body.

In one instance a non-Jew was inveigled into the nefarious scheme, and the method was also typical. The Jewish principals wished for another clearing-house through which to dispose of their securities, and were "tipped off" that a young non-Jewish broker was on the verge of bankruptcy. He was "helped out" and given what appeared to him to be a very profitable piece of business. Once in the power of his "friends," and deeply entangled in their game, he tried to get out of it. He was threatened with death. The Jewish principal said to him: "I don't want any double-crossing here, or I'll kill you in a minute. If I can't do it—if I am locked up—there are plenty of my gang who will do it."

Upon the arrest and confession of this non-Jew, many of the Jewish principals fled New York, traveling, as usual, under their assumed Christian names. But their identity had at last become known, and although many of their messenger-boy dupes have been made to suffer the penalty for their crimes, the leaders are at this writing yet free, and the most powerful influences seem to be invoked to protect them from the ordinary operations of the law. A few have been captured, but although their accusers are the most powerful banking, brokerage and surety companies on Wall Street, a power greater still seems to defend them from the treatment usually accorded known criminals.

One of the ringleaders has defied the courts with impunity and still walks the streets. Jewish theatrical managers in New York have headlined his actress wife, a Jewess, presumably because of the added prestige it gave her to be the wife of the world-defying bond thief.

Insolence Toward the Authorities

THAT is the element which strikes something like consternation to the heart of the ordinary lover of law and order—the insolence with which these wealthy Jewish criminals regard all the agencies of the law. They are defended by clever lawyers, and the attitude of the Jewish press and Jewish population toward them is compact of sympathy and admiration. Why not?—since most of the individual victims of the thievery are Gentiles, and the general victim is Gentile capitalism itself!

There is complete silence on the Jewish side regarding this reign of crime. And yet inevitably the Jews themselves must suffer most from it. The New York Kehillah has completely ignored this outbreak and its exposure. The spokesmen of Jewry, so voluble against non-Jews, have no word to say to those whom they would probably call their "co-religionists." Yet it is well enough understood that so closely combined are all the influences in New York Jewry that a determined effort on the part of the leaders could clean up many untoward conditions now existing. But there seems to be a distinct aversion to anything that will indicate a division of one class of Jews against another. It is a racial instinct, evidently, to protect the threatened one no matter how richly he may deserve punishment.

It is this fact which puts the finishing Jewish touch on the whole matter. It may, of course, be an accident that all the criminals and their tools, with an occasional exception, are Jews. That of itself might not be a reason, in the extreme sense, for labeling the condition with a racial name. But the silence, the approbation in some quarters, the very active sympathy in others, all combining as a racial protectorate around the wrongdoers, is the more regrettable manifestation of the two.

A book containing over 200 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

The *Literary Digest*, in the issue of November 6, gives a one-sided statement of the present discussion of the Jewish Problem in America. It is very interesting in view of the claims of that weekly to give a fair view of both sides. The bulk of the article, seven-eighths of it, is given up to Jewish defense. In the same issue, an article on recent immigration mentions eleven nationalities, but not the Jews. This is also unrepresentative of the American press, most of the newspapers which have discussed the question at all having mentioned the Jews. The founder of the firm which publishes the *Literary Digest* was Isaac Kaufman Funk, whose name appears as chairman of the board of the Jewish Encyclopedia.

Seven steamship lines are advertised in Warsaw papers as having arranged to supply kosher food in the ships' messes as a concession to the large Jewish emigration.

The railroad tickets of Palestine bear English, Hebrew and Arabic printing.

George Kahn, a Jew, has been appointed one of the permanent Danish representatives on the League of Nations.

"An epidemic of baptism" is the term which the Jewish press gives to the numerous conversions to Christianity now occurring among Austrian Jews. It may be significant, this frequency with which Jews attribute unworthy motives to themselves at every step.

In an editorial which condemns efforts made to study the Jewish Problem in this country, the Boston *Transcript* says: "Aside from Lenin himself, there are, indeed, few really prominent Russian Bolshevists who are not Jews."

This is from an editorial in the Toledo *Israelite* of November 5: "Last year, we understand that six million copies of the New Testament were sold in America. . . . There is real pathos in these figures for *every copy of the New Testament is breeding anti-Semitism.*" (The italics are ours.)

Sir Alfred Mond, a British Jew who specializes in nickel and newspapers, speaking in London on the subject of Zionism, said, "Jews have been financing all other countries, and must now finance their own country."

The Greek Government has ordered the deportation of certain Jews from Russia whom the Jewish press describes as "refugees." The Greek Government undoubtedly would use another term to describe them. With the Jews, every world traveler is a "refugee" and every detected criminal "a persecuted Israelite."

The British High Commissioner in Palestine, Sir Herbert Samuel, has made obligatory the use of the Hebrew language on all official documents.

The Jewish press is now giving indications of its purpose in stimulating Socialist organizations. It appears that part of the Socialist's education is devoted to the idea that anti-Semitism and reaction go hand in hand. With this "education," the Socialists are expected to remain impervious to any facts that may be presented concerning the Jews. The magic word "reaction" will suffice for everything. American socialism, however, may not prove so accommodating.

Baron Edmund Rothschild will soon visit Palestine.

Russians who are immigrating into Servia from Russia are bringing with them a strong anti-Jewish feeling, according to reports in the Jewish press. The reasons assigned by the Russians are based on Jewish Bolshevism in the Russian country.

Rev. Mr. Elias Newman, of Chicago, Illinois, described in the Jewish press as a minister of the Presbyterian church, has preached a sermon against the present discussion of the Jewish Problem. Mr. Newman hardly appears to advantage on the Jewish pages. Everything he says is precisely the same, even to the order of the ideas, as the standardized refutations which Jewish spokesmen have been making for some weeks. It is regrettable that Christian clergymen should allow themselves to be used in this manner.

Prospects of a Reunion of Churches in England

By W. P. CROZIER

Manchester, England, November—(By Mail).

IN ENGLAND it was a favorite topic of discussion between 1914 and 1918 whether the war would lead to a great revival of religion. There was much, especially in the earlier days, which seemed to suggest it. Professions of the highest ideals were made by the leaders of the people and accepted warmly by the rank and file. There was a general consciousness that the country was fighting for a sacred cause. There were reiterated appeals with many degrees of emotion to the approval and support of heaven. It is true that the terms used in this country as in some others seemed sometimes to suggest that it was a strictly nationalistic deity, patriotically supporting the chosen people, whose name was called in aid. Still, the religious idea was more in the air than it had been. Many people unquestionably felt a new need for divine support, just as the prevalence of death in every quarter of the land made them feel, some for the first time, others more sharply than they had ever done before, the need for belief in immortality.

The war has gone and with it the idea of a revival of religion. The ablest of our English deans was asked not long ago to discuss the change which in his opinion had come over religion in England during and because of the war. He replied that there was no change and therefore nothing to discuss. There was, he thought, the same faith and fervor in a fraction of the people, the same conventional support of the general body of churchgoers, the same indifference and apathy on the part of the people as a whole. There is no question about this. So far as the bulk of the population is concerned there is no change of heart, no quickening of spiritual impulse, no revival such as has come over one country or another in religious history from the time of the great founders of religion down to that of John Wesley himself.

No doubt it was foolish to expect that any such revival would take place. After all, war is a method of violence, a reversion to the crude force of barbaric man and normally it stimulates and feeds on every form of passion. It has little contact with the religious spirit except in the moments of exaltation which may coincide with the early aspirations of a great struggle but rarely persist when a prolonged war is working itself out through the appropriate barbaric means. The war spirit still persists and shows itself almost every day in the abrupt and violent activities of the social organism. When under the stress and strain of war, men were driven to work together with more thought of the community than of self, but that is gone or nearly so. Every man for himself is the spirit left by the war, which on the religious side has increased the self-sufficiency of the individual rather than any sense of dependency upon a higher power.

War Has Brought Sentiment

ONE thing, however, the war has done. It has made the churches in England increasingly conscious of their divisions. The divisions of the Christian church have long been a scandal of Christianity and to the layman it has always been astonishing that the devout followers of the churches, and especially the clergy, should have realized so little the discredit which a divided church brings on them. Many of these differences could be justified by no intelligent person. Not to mention the cleavage between the great Orthodox and Roman churches, we have in England here, besides the Church of England, a large number of dissenting or nonconformist denominations and in some cases as in that of the three Methodist bodies (the Wesleyan Methodists, the United Methodists and the Primitives) it would puzzle any ordinary man or woman among their adherents to explain what differences of true religious belief justify such a severance into separate organizations overlapping in their work, each with its own churches, officials and ministry.

Differences of administration and social distinctions there certainly are, but what has that to do with true religion? When some of these dissenting bodies split off from the parent church the grounds of dissension may have been serious enough, but nowadays they are little more than formal, there is no reality about them and no sincerity of feeling, but to an indifferent public they give ground for constant criticism. If the churches cannot heal their own unsubstantial wounds, how shall they heal the wounds of others that are real? Organized religion is on the decline in England and it is no doubt the recognition of this, together with some stimulus derived from the testing times of the war, which has prompted the clergy, both Anglican and Methodist, to make a new and serious effort for reunion.

Three Movements Under Way

THERE are at the present time three separate movements on foot.

The first is that which has been started by the Anglican church to procure reunion with the Free Churches of England. The Anglicans, of course, desire also reunion with Rome and with the Greek Orthodox church. Some of them, indeed, are very much more anxious about this than about their own countrymen of the Free churches, but the majority of them, being well aware that the differences with Rome are more fundamental, have thought it wiser to begin with their own nonconformists.

There is a project which now approaches its final stage for the reunion of the three Methodist bodies, an achievement, I suppose, long consummated in the United States. This proceeds from the Wesleyan Methodists and the detailed scheme is now before the local governing bodies of the church and if all goes well there may be a successful finish to the negotiations in some two or three years' time.

The third movement is one to form a close federation of the Free churches. There would, that is, be a definite number of representatives of each of the churches acting together on a common council. We have already had for a good many years the so-called Free Church Council. Wesleyan Methodists, however, have always fought a little shy of its political activity. They are the least political of the Methodist organizations and for a long time included a large leavening of Conservatives because they draw more adherents from the prosperous middle class than does any other Methodist church. But this is in every way the least important movement of the three.

The bishops assembled in the great conference at Lambeth recently have made an appeal for Christian reunion. It contains a confession which, considering its source, is one of the most remarkable that has ever been made by an ecclesiastical body. The bishops say that while the original causes of division in the church were not wholly blameworthy, the principal factors in producing them were "self-will, ambition and lack of charity among Christians," and that these highly un-Christian qualities "together with blindness to the sin of disunion" are still mainly responsible for the continuance of division. This is a new voice indeed. Hitherto the ecclesiastics of the church have almost always contended that the divisions were based on differences of principle for which they at least were not responsible and it is clear that as soon as any Christian body becomes willing to confess to error and express contrition the door to reconciliation is thrown open wide.

The bishops, however, have laid down the conditions of reunion. Some of them will cause no difficulty to Free church men. The acceptance of the Holy Scriptures and of the principal creeds and communions could be accepted without difficulty by almost any Christian. The crux comes with the question of the episcopacy—the status and commission of the bishops. The Lambeth bishops specifically say that they do not deny the "spiritual reality" of the ministries of other communities. They do, however, suggest that the ministers of these other communions should accept reordination at the hands of the bishops. In other words, they are insisting on the doctrine of apostolical succession and this insistence will be widely taken by Free church ministers as denying the validity of their own commissions as ministers in their own churches. The bishops, it is true, suggest that Anglicans on their side should accept some form of commission or recognition such as would commend them to the Free churches. But the fact is that at the present time they do not require any such commission to make them so acceptable and they are therefore offering nothing in comparison with the demand which they make. It is very doubtful, according to present indications, whether the ministers of the Free churches, whatever else they may agree to, would submit to being reordained by the bishops of the Church of England.

Nevertheless, the whole spirit of the bishops marks a great advance. It is the approach not of superiors to inferiors but of equals to equals—a change the more marked in that the Anglican church still represents a higher social standing and a higher learning as compared with nonconformity. It indicates therefore an impulse of the Christian spirit in the bishops and they have given earnest of their sincerity in urging that the Anglican authorities should everywhere invite the other organizations to deliberate with them on the means of bringing about reunion. It will not come yet, but for the first time it has become a question of practical politics.

Methodists' Differences Slight

THE differences between the three Methodist bodies ought to be easy to adjust. They relate rather to administration than to doctrine, to practical details than to principles. There are divergencies among them as to the respective powers and status of the ministers and the laity, the Wesleyans giving a greater authority to the ministers, as becomes their more direct descent from Anglicanism, while the United Methodists and the Primitives accord a larger part in church government to the laymen.

These are constitutional differences, but there are also considerations of sentiment and of social prejudice. Some of the opponents object to merging their "identity" in a larger body, while the Wesleyans for the most part come from a rather higher social stratum than the others. The farmer, it is sometimes said, is to be found in the Wesleyan Methodist chapel, his laborer in that of the Primitives'.

But clearly all this, though it explains why the cleavage between the churches has subsisted so long, has nothing to do with the spirit of Christianity or of true religion. The question of the division of power between ministers and laymen does not justify a breach in the Christian church, let alone a breach which has lasted scores of years. One cannot get away from the belief that the divisions in the church have persisted largely because of the lack of the religious spirit in its leaders, and that because the churches have so much lacked true religion the rest of the community has been content to go without it too.

America Has Greatest Caves

CAVES are no longer the dwelling place of man but they are still among the most curious of natural wonders. They are so dark and mysterious, and many of them have such interesting histories, that our curiosity concerning them is as keen as in the days when they were the hiding places of bandits and pirates.

The United States perhaps has more unusual cave formations than any other country. In the first place, we have the largest one, as far as has been discovered. This is the Mammoth Cave, about 85 miles from Louisville, Kentucky.

Parts of this great cave have been explored for a distance of over 150 miles and maps made so that the guides themselves cannot get lost. The main body of the cave is only about three miles long, yet parts of this section furnish the famous halls and domes, some of which are 175 feet wide and 125 feet high.

This cavern has many small lakes and rivers, the best known of these being Echo River, which reverberates an echo to an untold distance, repeating the sound of your voice until only a whisper is heard at the last. The fish in this and the other bodies of water are white and have no eyes. There are also crickets, bats, flies, beetles, spiders and other queer blind creatures to be found here, and it is interesting to watch them when they are taken out into the light. Being blind, their movements are quite slow and cautious when compared to their kind that are alive out in the open.

In taking a hike through this world's largest cave the guides light up the way so that many beautiful things can be seen, such as the Star Chamber, where the lofty ceiling is studded with snowy crystals that glisten like diamonds. When white men first discovered Mammoth Cave they found many stone arrowheads, pieces of torches and other relics which indicated that it once had been a meeting place for the Indians, and for all we know countless numbers of war dances may have taken place in the famous Star Chamber just mentioned.

Wyandotte Cave is another one of our great caverns and ranks next to Mammoth Cave both in size and interest. It is in Crawford County, Indiana, and so far has been explored for more than twenty-three miles. In its depths are found many formations similar to those of its bigger sister, one of the chambers being 200 feet high and 300 feet broad. The temperature and moisture in the air are so even that you can walk a great distance without feeling the least fatigue until coming out into the open once more. But if you happen to be one of those few folks who do not indulge in hikes you'll certainly feel the results of the long walk after sitting around for a few minutes.

In Page County, Virginia, is Luray Cave, where many things of interest are to be found. One room in this cavern is called the Fish Market, on account of the flat fishlike stalactites that are arranged about the walls, and many visitors have declared that they can recognize the forms of several kinds of fish. In Giant's Hall there are many bright rocks that glisten in the torchlight, while in what is called the Cathedral there is a stone organ formed of different lengths of this substance, which upon being struck with a piece of metal gives out musical tones. Simple music can be played upon it, and of course the various echoes cause it to sound like several instruments being played, each of them in just a little slower time.

Numerous other fairly large caves are to be found in our country, as there is scarcely a section of it in which none is found, but the three mentioned are the most famous ones, so we now pass over to Europe for more interesting items about caves. The largest one in Ireland is Fingal's Cave, situated on the Island of Staffa, off the coast, and originally formed by the constant washing of the waves. There is very little room to hike around in this cave, for most of the floor is of water, but when the sea is calm a nice boat trip can be taken into its depths. Fingal's Cave is 42 feet wide at the entrance, 22 feet wide at the end and 66 feet high, which, of course, makes it seem quite small after speaking of our big inland caves, but it must be remembered that this cavern was formed by the waves of the sea alone, so this fact makes it very remarkable.

England and Scotland have many caves, though most of them are small. Along the rocky coast of Scotland can be found caverns formed by the waves, but in Peak Cave, Derbyshire, England, there is much of interest. One peculiar thing about the English caves is the marvelous relics found there, Peak Cave having furnished the greater number. When first explored it contained fossil remains of rhinoceroses, lions, hyenas and other wild beasts now found in parts of Asia and Africa. This seems to indicate that England was once a tropical country. Stone axes, hammers and other implements also were found, showing that the people of that day lived in caves. Peak Cave is not a very large one, as it is only about a mile in length and 600 feet below the surface.

The deepest cave known in the world is one found near Frederickshall, Norway, it being 11,000 feet. Think of it, almost two miles deep! But it is worth the trip down into its depths, for many of the wonders of nature are to be found there. However, when it comes to real beauty and interest there are no caves that can excel our own.

Trespassing on Mr. Burroughs

By GEORGIA JACKSON

"THAT'S Mr. Burroughs' fence you ate your supper on," said the gray lady. I wasn't surprised. It looked like the sort of fence Mr. Burroughs would have—a low stone wall, topped with ivy, where a hungry hiker might find a bare spot to make coffee and drink it the while she gladdened her eyes with the green slope edged with shrubbery and the leisurely Hudson beyond.

"I ought to call and pay my respects," I said. So I went down the steep path from the highway, past a friendly calf, to a summerhouse overlooking the river, where I could see the top of a gray head above a high-backed chair, and a young woman sitting on a bench. At the sight of the top of that gray head I felt the thrill of trepidation which only comes when one is going to see for the first time a celebrity one has heard about all one's life. I was right. The top of the gray head belonged to Mr. Burroughs. He rose to greet me—frail, but vigorous, keen-eyed, aureoled with gray hair and beard. My heart did homage to his true venerableness. His face is a fine face. When he spoke, it was with a gentle, even voice that gave no hint of age. Neither was there hint of age in his simple, kindly words. I explained my intrusion, saying, "They tell me I ate my supper on your fence."

He laughed indulgently. "You should have come in and eaten it in my summerhouse," he replied. "I saw you on the road this afternoon when I was out driving, and I said to my friends, 'There's a girl out for a walk.'"

One of the trees near the summerhouse had sent a branch down near his chair. "See what I have here," he said, pulling the branch down a little. It was a bird's nest, with four blue-green speckled eggs in it.

"What kind of bird is it?" I asked, rather ashamed not to know.

"Oh, the little social sparrow," he replied. "She sits there by my ear and broods on her eggs, and I sit here in my chair and brood on my thoughts." A twinkle came into his eyes and his voice. "I don't think she will addle the eggs, but sometimes I am afraid I addle my thoughts. Maybe you'd like to see my study where I hatch them out," he added, and led the way, only a step or two, to a little square building, delightfully covered with bark outside. Inside, the study consists of one spacious, well-lighted room, with front windows opening on the river. Of course there are books marching around the room in built-in bookcases, and these yield ground only to those honored rivals, a generous fireplace and windows where the trees can look in at their busy friend. In the midst is a large writing table with an orderly litter of papers on it. Mr. Burroughs sat down in the comfortable working-chair beside it, and I thought how many times he must have lifted his eyes from his writing to let them rest on the Hudson gleaming through the trees. He waved his hand toward a cluster of portraits near by.

"I have some of my friends with me, you see," he said.

His friends! I rather knew whom to expect; Roosevelt, of course—a handsome full-length photograph; Whitman, John Muir, Edison, and many other familiar faces. There was a group of older scientists and philosophers. Then there was Carlyle, and several fine pictures of Emerson.

"I see you like Emerson," I said. "I grew up on him."

"So did I," he said with enthusiasm. "That portrait of him I picked up in London. It must have been taken when he was over there."

"Speaking of growing up," I said, "one of the things I fed on was your 'Serene I fold my hands and wait.' That was my introduction to you, and was one of my dishpan poems. I hated to wash dishes when I was a little girl, and relieved the tedium by memorizing poems I liked."

Edison's photograph reminded me of the holiday these two and others took together last year; Mr. Burroughs smiled as I mentioned it. "Yes, we had a fine time," he said, and spoke of similar projects on foot. "Mr. —— says he wants the party to go to Europe—to take a house in London and then tour the country and the continent from there, going through the war district," and to my inward astonishment at the thought of such a jaunt for an octogenarian, he added quite casually, "I don't know which of the plans he will finally adopt, but I told him I was ready for any of them, though I prefer Europe."

As we left the study, my conscience smote me, and I prefaced a withdrawal with a remark about "taking up so much of his time."

"My time isn't worth much this time of day," he said. "You are quite welcome to stay if you wish."

So we sat down in the summerhouse and talked.

"You have another home a few miles from here, haven't you?" I asked.

"Yes—Slabsides—just a cabin in the woods. We're going over there for a picnic tomorrow. This place we call Riverby. In the summer I usually spend some time up at Roxbury, where I was a boy."

One of my reasons for wanting to talk to Mr. Burroughs had been to get confidential information about some other writers. So I asked him in general about some "naturalists" whom I had recently heard were improving upon nature.

"I can smell a nature-faker," he said, and raised his head with a whimsical gesture, breathing in a great sniff, "just like I can smell a skunk. They always give themselves away."

I mentioned a well-known name, tentatively.

"Yes, I'd be rather careful about him," said the gentle old man. "I've known for a long time now that he wasn't quite right, and I'm glad other people are beginning to find out. I'd like to have him know that I think he's a faker," his smiling eyes swung around to me, "but you can see I wouldn't quite like to sit down and write him that I think so. Now I wouldn't call Mr. —— a faker," he went on, "because he is frankly a romancer. He doesn't take liberties with nature and then say it's true." Another was summed up: "He's a good fellow—I think he's a good fellow all right. He can imitate the call of wild animals the best of anybody I ever knew. He sent me a very cordial invitation to come out to his place this spring, but I told him I had an engagement at that time with the Vassar girls, and of course I couldn't disappoint them." In general Mr. Burroughs was a discerning critic, and a kindly one, generous in his praise of his colleagues.

I spoke of Viscount Grey's little book "Recreation," in which he tells of taking Roosevelt to hear the English birds. Mr. Burroughs had not seen it. "Roosevelt told me about that walk," he said. "I must send for the book."

"He had to make Roosevelt wade across a mud puddle," I said, "but the Colonel didn't mind it."

"Mind it!" said Mr. Burroughs with delight. "I should say not. He would go into a stream up to his waist and think nothing of it. The last outing I took with him was down at a place they called Pine Knot—a big barracks of a house miles away from anywhere. They lived and cooked downstairs and slept upstairs. He took me along to help him name his birds. I've never written that up yet; I will some day."

He began talking of his reading, and naturally it was not long before we got to the heart of things.

"I am convinced of a directing intelligence," he said, after disposing of this scientist and that philosopher.

"These birds and these trees know what to do; something tells them. There is the law in everything. I believe that God is in everything—immanent. And therefore my friends tell me I am a pantheist. But the good church folk say that God is a spirit; and I say, 'Where is he?' and they answer, 'Why, everywhere.' So in the end we agree. As for immortality—I see nothing to prove it—"

"Or to disprove it?" I suggested.

"Or to disprove it. There is one thing," he brought his hand down with a light blow of contentment on the arm of his chair, "if there isn't immortality, we'll never know it. And if there is immortality, we'll have to accept it and put up with it the best we can."

In a moment he went on. "I have a book now going through the press in which I have tried to say how these things look to me—a sort of summing up of the conclusions of four score years of reading, observation, and thought. I call the book "Accepting the Universe." You remember that Margaret Fuller once said she accepted the universe, and when Carlyle heard it, he said, 'Gad, she'd better!'" He smiled thoughtfully and then epitomized the book for me. But here I am quoting his words not from memory, but from the book itself, which has just appeared: "I have concluded . . . . that this is the best possible world, and these people in it are the best possible people. The heart of Nature is sound. I feel toward the great Mother somewhat as a man does who takes out a policy in an insurance company: he believes the company is solvent and will meet its obligations. I look upon the universe as solvent and worthy of trust . . . . Theological grounds do not count with me. I want nothing less than a faith founded upon a rock, faith in the constitution of things. The various man-made creeds are fictitious, like the constellations—Orion, Cassiopeia's Chair, the Big Dipper; the only thing real in them is the stars, and the only thing real in the creeds is the soul's aspiration toward the Infinite."

It was growing dusk when I rose to go. "I'll never forget this as long as I live, Mr. Burroughs," I said, and he sped me on my way with kind words.

The gray lady called to me as I went by her gate, "Did you see him?"

"Yes," I said, "I've had a long talk with him."

"He's a fine old man," she said heartily. "The minister sometimes preaches about him. He says this would be a better world if there were more men in it like Mr. Burroughs."

MR. BURROUGHS ENJOYING HIS STUDY

Waiting

SERENE I fold my arms and wait,
Nor care for wind, or tide, or sea:
I rave no more 'gainst time or fate,
For lo! my own shall come to me.

I stay my haste, I make delays,
For what avails this eager pace?
I stand amid the eternal ways,
And what is mine shall know my face.

Asleep, awake, by night or day,
The friends I seek are seeking me;
No wind can drive my bark astray,
Nor change the tide of destiny.

What matter if I stand alone?
I wait with joy the coming years;
My heart shall reap where it has sown,
And garner up its fruit of tears.

The waters know their own, and draw
The brook that springs in yonder height;
So flows the good with equal law
Unto the soul of pure delight.

The floweret nodding in the wind
Is ready plighted to the bee;
And, maiden, why that look unkind?
For lo! thy lover seeketh thee.

The stars come nightly to the sky;
The tidal wave unto the sea;
Nor time, nor space, nor deep, nor high
Can keep my own away from me.

JOHN BURROUGHS.

A Novelist of the Screen

By JOHN B. WALLACE

THEY say that God loves the Irish. If that is true He certainly loves Mary O'Connor, for she is Irish from the tip of her toe to the crown of her auburn head. Miss O'Connor is a big woman, big physically, big mentally and with a great big Irish heart. And she needs every one of these qualities to hold down her job of editor-in-chief of the scenario department of the Famous Players, Lasky Corporation, the largest motion picture concern in the world.

Miss O'Connor picked a most fitting day for her début in the motion picture game eight years ago. It was on the seventeenth of March that while visiting relatives in San Francisco she received a telegram stating that the script writer of the Vitagraph had fallen and broken his leg and would she please come and take his job. She packed up that morning and left for Los Angeles. Today she is probably one of the highest salaried women in pictures with the exception of some of the big stars.

Miss O'Connor was no tyro in the writing business when she joined the movies. She had been a feature writer on eastern papers and had spent three years in the editorial department of *Munsey's*. But writing for motion pictures in those days was a new line for everybody and she has grown up with the business. From the Vitagraph she went to that greatest of all picture producers, David Wark Griffith. From him she imbibed that enthusiasm and loyalty to her work that is her most outstanding characteristic. She has witnessed the evolution of the scenario from the crude notes of a stenographer taken at conferences between the directors, film writers and actors to its present form of literary art.

MARY H. O'CONNOR

In fact the only rise I got out of Miss O'Connor during our interview was when I inadvertently alluded to continuity writing as hack work. She soon showed me my error and I hastened to explain that it was but a poor choice of words and that I had really meant detail work.

I had but little conception of the extent of the scenario department of a big film company until I started down the long corridor that leads to Miss O'Connor's office. For half a city block I was flanked on both sides by dozens of little offices from which issued the clackety-clack of typewriters grinding out continuity. This last, while not a new word in the dictionary sense, is new in its present meaning. It refers to the preparation of a story for the screen and goes into details of action that are never dreamed of in writing a novel or short story. Every movement that the actor is to make in bringing out the action of the story is put down in black and white.

Continuity writing is a new art—one that pays most liberally and is attracting hundreds of experienced writers from the newspapers and magazines. But even these experienced writers do not start off with éclat. They find that they are indeed in a new game, so new that the rules are not yet formulated and not all of them succeed. A good continuity writer requires above everything a vivid imagination. They must see things from the angle of the camera and they must have a fine eye for detail.

Miss O'Connor has small patience with the so-called schools for scenario writers.

"Fakes!" she ejaculated contemptuously. "They can only at the best teach a few fundamentals. The things that go to make up a successful writer for the screen are not things that can be imparted any more than you can make a successful author or short story writer by giving a few lessons in rhetoric. It must be in the writer just as the talent must be in the artist or the musician. Given the talent the screen writer will soon pick up the technique."

"What would you advise then for the person ambitious to become a scenario writer?" I asked. In asking this question I'll confess I had an ulterior motive, for I, like you, dear reader, have a sneaking notion that I have the greatest plot for a scenario that has ever been filmed concealed about my person.

But Miss O'Connor, if she smelled a rat in the arras, gave no sign.

"I would advise such a person," she replied earnestly, "to study pictures. To take novels and try to scenarize them. When I was breaking into the business I would attend picture shows and jot down the number of cuts. I would then endeavor to see where I could improve the action if I had been making the picture; where I would prolong such action or cut sooner. Then I would take novels or short stories. I would figure out where I would begin my action; what scenes I would leave out and what scenes I would add. The way to learn to write novels is to write novels. The way to learn to write scenarios it to write scenarios." This, mind you, in spite of the fact that Miss O'Connor each morning rakes in her paper from the area way in fear and trembling lest she find a scenario concealed within it. She told me a story of a scenario that arrived at the office one day and appended to it was a postscript stating that the author was also an expert layer of cement and if the story was not up to snuff he would be pleased to bid on any jobs of concrete that she might have.

While not exactly a worker in concrete I took the hint and, resolving to stick to my trade, forbore to mention my own idea for a scenario.

Miss O'Connor is vice president of the Screen Writers Guild and being the only woman officer of this most exclusive organization esteems the honor very highly.

"The qualifications for membership in the guild," she said, "are such that only recognized writers for the screen can be admitted. Even well-known writers of novels and short stories must serve their apprenticeship in screen writing. The purpose of the organization is to raise the standard and ideals of the profession as well as to insist upon a better rate of compensation for the writers of original screen stories. After all, the story is the thing and why should the author receive but a tenth of the sum that is paid the actor who interprets it?"

Miss O'Connor believes that the day of the star is past in pictures and that the era of the writer is just dawning.

"I was talking today with Douglas Fairbanks," she said, "and he told me that he was going to take a long vacation. Mary Pickford is making no pictures now. William Hart is quitting for a time at least. Charlie Chaplin is talking vacation and is not working at present. Do they see the handwriting on the wall? When they are gone there will be no one to take their places—except maybe a few new types such as Charles Ray, but from now on the play will be the big attraction, not the star."

She believes that the day of the picturization of the novel is also about past. This is because of the fact that the supply of available novels is about exhausted.

"Comparatively few novels lend themselves to filming," she said. "An author can take a chapter describing the emotions of his hero or heroine. On the screen it can only be a flash. The majority of our novels, and this includes some of the greatest, lack sufficient action for screen purposes. Even in the ones we use we have to add to and leave out so much of the plot that it is sometimes hardly recognizable. This naturally causes great anguish to the authors but it has to be to get it over on the screen. We have paid as high as $40,000 for the picture rights of a novel but it was the name we were buying."

So convinced is Miss O'Connor that the day of the original writer for the screen has arrived that she herself is about to resign her position as editor-in-chief and devote her entire time to writing feature films. At the present time she is initiating Sir Gilbert Parker, the great Canadian novelist, into the mysteries of scenario writing.

"When men like Sir Gilbert and James Barrie, whom we have also under contract, and writers like Gertrude Atherton and Rex Beach take up original screen writing," she argued, "it certainly proves my contention that the day of the writer has arrived in filmdom. A few years ago great authors sneered at the pictures as being beneath their dignity but thanks to Griffith and others they are beginning to realize the artistic possibilities."

Reverting to the passing of the stars, I asked Miss O'Connor if she did not think that the stars themselves were much to blame for their wane in popularity.

"Well it takes a pretty level head to stand prosperity," she admitted. "People may be gifted in some lines and not in others. If, however, you are referring to certain scandals I must say the public has sadly misjudged some of our stars. I know them personally and cleaner minded or better moraled persons never lived, although I suppose it would be impossible to convince the public to that effect. No, the star system is dying out not because of lack of merit in the stars themselves but because motion pictures are evolving to such a plane that stars with unique personalities are not necessary to make them popular."

Miss O'Connor predicts the revival of the costume play in pictures.

"We have nearly completed the cycle," she said. "War plays, problem plays, western plays, we have just about exhausted the repertoire. The bucolic and sex plays are having their day now. The time for the "Knighthood was in Flower" type is soon to come again. At least that is my guess."

The Census Bespeaks a Sound America

Concluded from page 3

pensing with all animal power. The growth of the mule population is probably due to the fact that the automobile has decreased the value of the horse as a varied convenience, suitable for field, vehicle or saddle; many farmers that used to keep a horse or two for pleasure as well as practicable use now gets along with a motor car and a mule or two. In fact, for duty requiring mere strength the mule is rated by many experts as far superior to the horse.

It is refreshing to note that though the first hundred counties show only slightly more farms and smaller farms than in 1910, acreage planted to the chief crops was larger in 1919 than in 1920. This is true of corn, wheat and hay. More cattle, too, are found on the farms, though the counties represent fewer of the cattle states than in 1910. There appears to have been an increase in cattle even in New England, quite to the surprise of the experts who have assumed that virtually all forms of agricultural activity were on the decline in that section. And as for hogs, the record is better than for cattle; the swine increase in the area reported on to date is unusual. But the hog population is subject to much and sudden fluctuation, depending on general conditions.

If values tell anything, the fact stands out clearly that agriculture has progressed wonderfully in America during the last ten years, despite some incidental indications to the contrary. In 1900 all agricultural property in this country was worth approximately twenty billions of dollars. In the ten years ending with 1910, the value doubled, reaching a total of forty billions, rated then as phenomenal. There is little doubt that the census of 1920 will show that those values have more than doubled.

The value of the products of the farm has kept apace with that of the farm itself. Nearly all the reports that have been consolidated show that the crops of 1919 were worth 100 per cent and over more than they were worth in 1909. Particular crops, like fruits and vegetables in Delaware and New England, show value increases of more than 200 per cent.

But in the face of other creditable showing for the farm, the well-known farm mortgage seems, from preliminary consolidations, to be more than holding its own. Those communities so far reported on show about the same number of mortgages as ten years ago. And the size of the mortgages have kept apace with the growing value of the farm and the declining value of the dollar. Usually they have doubled in average amount.

Census figures announced to date are of course preliminary and in some cases referred to in this article incomplete. But enough has been made known to indicate trends that the final figures will very likely bear out—trends that in some respects are surprising but yet on the whole indicative of a sound America and especially a sound American agriculture.

America's Dreadful Waste of Infant Life

Concluded from page 6

munity gets the care it is entitled to. The far-reaching extent to which that may lead depends upon how thoroughly and lastingly a community wants the work done. It may reach into the very heart of a community's economic life, to housing, sanitation, moral tone, even to the policies of employers of labor, especially with reference to women workers, to the wage scale paid in local industries, rents, and numerous other equations.

When, about twenty years ago, New York City took note of its then disgraceful infant mortality rate, the community's effort to lower it aimed only at looking after the sick babies of the poor. Though the work was well done, it had little effect on the infant death rate. Then they began to look after the infants of the poor while the infants were well with the view of keeping them well. Then the death rate began to come down and is now relatively low.

Most of what is being done directly for the welfare of mothers and infants is sponsored by unofficial philanthropy, like the work of the organization supported by the Red Cross and the numerous children's aid societies in cities. The United States Children's Bureau has long carried on a campaign of education.

Several large cities have tackled the problem officially.

It is now being urged that the Federal Government take the lead in the work. A bill providing a substantial appropriation to be distributed among states putting up equal sums for maternal and infant welfare is pending in Congress and, if reached, will probably be passed at the coming session. It represents a probably wise step, particularly as to motherhood which, aside from infants, presents certain statistics that are perhaps more disgraceful than the run of infant mortality rates; for we lead the world in the percentage of women, as compared with number of births, who lose their lives becoming mothers.

But infant mortality rates will be brought down only by vigorous community action, and lastingly only by that kind of action which will tend to raise the general economic and social tone of American life.

Before you accept the truth of a community's boasting regarding its livableness or its character or that of its inhabitants take a look at its infant mortality rating. Of course in a few cases the rate is high because of many infants not born in the community being drawn there by infants' homes and hospitals. Sometimes, too, a rate for one year may be due to a passing epidemic. But high rates over a series of years tell a story that no other figures, perhaps no other data of any kind, can give.

BACK TO NORMALCY

By JOHN BENSON

The Elephant sat on the White House lawn
Watching the Donkey pack up to be gone.
While the Donkey looked for a brief survey
The Elephant heard the Donkey bray:

I have a misgiving
The High Cost of Living
I'm handing to you as my heir
Will be a vexation
The same as taxation,
But why in the deuce should I care?
The old League of Nations
And foreign relations,
You'll find they are far from a joke,
And if unemployment
Should mar your enjoyment—
It's nothing to me if you choke.

The Elephant looked at the azure dome,
He turned to look at his future home,
He looked at the Donkey and winked his eye
And trumpeted willingly his reply:

The problems you're stating
Are not agitating
My mind, not a one of them robs
The luxuriating
Of just contemplating
The fact that I've got all the jobs.
Let problems come screaming
In regiments teeming,
I gaze with a conquering eye,
For—joy everlasting!—
From eight years of fasting
I'm back where they serve out the pie!

And then there came advancing
An enormous horde a-dancing
Like an army that was marching to a jazz.
In the dust of its migration
It was yelling its elation,
"We are here to give the Democrats the razz!
For we're going to take positions
In accordance with traditions
And we'll *'raus mit* all the Democratic gang!"
And they stopped before the portals
While emitting sundry chortles
As they lifted up their voices and they sang:

Oh Normalcy, sweet Normalcy,
Our orisons we make to thee.
Back to that beatific state
In good old eighteen ninety eight,
When old Mark Hanna rang the gong
To summon in the hungry throng!
Oh good old days, so far and free,
Oh happy days of Normalcy,
When good Mark Hanna fed us high
From soup and fish to nuts and pie.
Back to the good old days we go
For Normalcy is when, you know,
Republicans are round the pot
And all the Democrats are not!

And when they ceased their singing
Came the gentle breezes bringing
From the governmental offices about
The dim reverberation
Of the doleful ululation
Of the Democrats preparing to move out.
Oh the bulk of their intoning
Was as of a giant moaning,
As the southern breezes carried it away,
And the music softly creeping
Set their hearers all to weeping
As the Democrats were understood to say:

We had a wonderful, wonderful time,
But it's over now.
Spending our millions like spending a dime,
But it's over now.
Ordering cities to spring from the ground,
Ordering millions of soldiers around,
Right at the spot where the orders abound,
But it's over now.

We've had a wonderful, wonderful day,
But it's over now.
Drawing the government's bountiful pay,
But it's over now.
Now we have got to go out in the wet,
No more munitions, no contracts to let.
Out in the world with our living to get,
For it's over now.

And then from the stills of the southerly hills
Came murmurings distant and faint,
And each head was bare for the old Southern air
That was sung with a note of complaint.
Oh, each bared his head as one does for the dead
And hushed the harsh speech in his mouth
As he harked to the word but imperfectly heard
Of the ghost of the old Solid South.

Oh way down South 'mid the four bit cotton,
Gosh almighty, things are rotten,
Come away, come away, come away, come away.

They've taken Oklahoma, away, away,
They've put the bee on Tennessee,
The South ain't what it used to be,
Oh my, oh me, away down South in Dixie.

Away down South where Democrats
Wore long tailed coats and high silk hats,
Come away, come away, come away, come away.

They've put us in the cooler, away, away,
The South of yore, it ain't no more,
We never saw the like before,
Oh my, oh me, away down South in Dixie.

As each in sentimental mood
Dashed teardrops from his nose
There came an infant nearly nude,
In torn and shabby clothes.
Her hair was fair, her face was sad,
Her eyes were blue and mild.
Then up spoke one and cried, "Bedad,
"Now who is that there child!"

She looked at him as though appalled,
Though no one threatened her,
And timidly she said, "I'm called
The League of Nations, sir.
I am a little orphan girl,
To none do I belong."
She twisted at a golden curl
And then began her song:

"Oh who will take the orphan in,
Oh who will shelter me,
That once to emperors was kin
In lands beyond the sea?
For I was born in pomp and state
In far-off Sunny France,
And everybody called me great,
My glory to advance.

Then strong men felt the starting tears
And many heaved a sigh;
While some but boxed the infant's ears
More smacked her in the eye.
For round the crowd a murmur ran
That laid their pity flat
As man went whispering to man,
"The child's a Democrat."

Then the Donkey said to the Elephant,
"They're getting a little bit rough."
But the Elephant said with a roguish smile,
"They're treating her well enough.

"Just hammer the kid when it's small
And it will be good when it grows,
For that is a fact on which I act
And one that everyone knows."

The Donkey said to the Elephant,
"They'll murder her with that stuff."
But the Elephant said like a wise old bird,
"Oh no, the kid is tough.

"We'll kick her around for a year
And wallop her till she's flat,
And then our concern her love will earn
And we'll adopt the brat."

And while they argued pro and con
A solemn group was coming on,
Of men of aspect most severe,
Aloof and chill, reserved, austere,
Whom all observed with awe and fear,
Who cast about a pallor drear,
Who could not see but seemed to hear,
Whose awful presence could besmear
The sun with soot, cause winds to veer,
And clouds the orbed moon to blear.
From far and near men came to hear
Their voices bleak, their voices clear
That stabbed like knives in every ear.
Thus spoke the Nation's Last Resort,
The Dread, Unchallenged, Highest Court.

Parties come and parties go.
(Give him a writ of Fee, Fi, Fo.)

We go on till the end shall come.
(Give him a writ of Fee, Fo, Fum.)

Presidents come with every tide.
(Writ of Fo Fum Fee denied.)

We go on and we never die.
(Give him a writ of Fum, Fo, Fi.)

Wars may wage, but we are not moved.
(Writ of Fo, Fi, Fum approved.)

None there are as great as we.
(Grant him a writ of Fo, Fum, Fee.)

Some are high, but we are It.
(Fee, Fi, Fo, Fum, here's the writ.)

A Firewood Forest for Every Town

A GOODLY portion of the people of the United States would eventually be able to laugh at miners' strikes and railway tie-ups if they were to follow the excellent advice of Charles Lathrop Pack, president of the American Forestry Association. Pack, you know, is the man who has gained an international reputation as a result of everlastingly and eternally talking and writing upon the subject of planting trees. According to the belief of this hustling and exceedingly useful man, no person—man, woman or child—has really commenced living until he has planted a few hundred trees on some highway or in a lot or field.

CHARLES LATHROP PACK

Mr. Pack is strongly urging the municipal authorities of every hamlet, village and town throughout America to immediately secure an adequate-sized piece of land and plant trees on it for the purpose of creating a municipal wood lot which would mature in the not far distant future. He believes that by pursuing this course it would be but a comparatively few years until many homes would be heated largely with the use of wood, using coal only during the severest zero weather of the winter.

Six hundred years ago the town of Zurich, Switzerland, started a municipal wood lot and it has been a good paying proposition through all those hundreds of years and it is still going strong. The area of the Zurich wood lot is 2,840 acres. The annual income to the city from the sale of firewood from this forest is seven dollars an acre.

It was in the year 1309 that the far-seeing citizens of Zurich put this forest under official management, and it has been steadily increasing in value ever since.

Farm owners also ought to adopt a wood lot policy for their own benefit. There is enough waste land on every farm in the country to grow enough trees to furnish stove wood, fence posts and other low grade lumber for all time to come. It might not be a bad idea to have at least one tree-planting day on all farms every year, and everybody should participate in the festivities.

The state of New York has already set a laudable pace in the matter of establishing municipal forests. In 1912 the legislature of that state enacted a law making it possible for counties, towns and villages to acquire through purchase, lease, gift, or condemnation, lands having tree growth or forests on them, or lands that might be suitable for the growing of trees.

It is ardently hoped that a similar measure will be passed by the lawmaking bodies of every state in the Union before another year has passed around.

Tree planting such as outlined above is not only a good thing from an economic viewpoint but it is of incalculable benefit in regulating stream flow, protecting watersheds, providing shelter from wind and storm, and furnishing homes for insect-destroying birds and food game.

The people of the state of New York are in dead earnest in their determination again to make it a commonwealth of beautiful and valuable forests.

Near the little town of Lacona, an enterprising lumber concern has planted more than half a million trees on farms abandoned on account of their lack of fertility. These trees were planted largely under the careful supervision of the New York State College of Forestry. The freshmen from this school are so efficiently organized that 21 of them can plant 35,000 trees in the short space of one week. These young men, in addition to the commissary staff, were organized in three groups of seven each, and one of these seven was elected each day as the leader of the party for that particular day. The other six were divided into mattock men and setters, and the work proceeded so systematically that over 1,000 trees were planted daily by each pair of workers.

Forty-five thousand trees were planted last spring in the publicly-owned forest at Malone, New York.

The children of the public schools of Watertown, New York, set out 10,000 trees, and the children of the Newburg schools followed with 5,000. The New York State Conservation Commission has planted literally millions of trees on state-owned lands.

Why not get the habit?

The Scillies for Sale

THE only reason the Scilly Isles get into the news just now is because the Prince of Wales is going to sell them. And that brings forth the reasonable comment: "I didn't know he owned 'em."

Well, he does, and he is. Who will buy them is another matter, but if anyone would like to purchase a nice sea-front group of islands, 140 in all, now's his opportunity.

How does the Prince of Wales come to own them? With the exception of the eldest son, none of the sovereign's children enjoy any privileges except a pension and the courtesy title of "prince." For example, they are not peers by birth and King George had to raise his second son, Albert, to a dukedom (Duke of York) to give him a seat in the House of Lords. And so far he's scarcely warmed it; Albert doesn't care for statecraft. But the eldest son gets a lot of privileges, and among those which precedent gives him is the duchy of Cornwall and York. The importance of the duchy of Cornwall and York is that it produces revenues; and the Scilly Isles belong to Cornwall, hence to the Duke of Cornwall and York, which is one of the titles (and a profitable one) of the Prince of Wales.

The Prince of Wales has curious ideas about property. Recently he visited his duchy and was shocked to find a lot of slum cottages. He ordered them cleared out, although it was carefully explained to him that they produced steady income, slum or no slum. However, he cut down his income by abolishing them. Now he says he wants to get rid of the Scillies—for cash.

The Scilly Islands are 25 miles west by south of Land's End, which is the southwest tip of England. They are the first glimpse of land afforded the ocean voyager who is making the port of Southampton from America. Of the 140 islands only 40 are distinguishable from mere rocks, and but five of these 40 are inhabited. Altogether they comprise a circuit of 30 miles.

They are granite and sand mostly, with steep cliffs, and treacherous passages between the rocks. Wild fowl abound and while the first impression is discouraging enough it is a fact that, besides the fishing industry, the Scillies produce large crops of potatoes and great quantities of flowers. The latter, narcissi in particular, are shipped to British markets.

The islands passed to an abbey, and a family named Blanchminster shared the government with the abbot in the fourteenth century. This is mentioned because the Blanchminsters used to punish a felony by taking the convicted person to a certain rock in the sea with two barley loaves and one pitcher of water to be left on the rock until drowned by the tide. Incidentally the abbot got all the taxes and returns except wrecks and whales, which were reserved for the Crown.

Latterly, the islands have prospered under judicious government. The five inhabited islands (all of granite as mentioned) are St. Mary's, Tresco, St. Martin's St. Agnes and Bryher. The total population is slightly more than 2,000. Hugh Town in St. Mary's is the capital, occupying a sandy peninsula crowned by the height known as the Garrison, with Star Castle, dating from Elizabethan days. The islands contain all manner of remains of prehistoric monoliths, stone circles, rock basins, and so on. They have also a more gloomy collection, débris from the hundreds of wrecks brought about by the treacherous nature of the waters near by.

Photograph selected for THE DEARBORN INDEPENDENT by National Park Service, Department of the Interior.

YOUR OWN UNITED STATES

A feature of Rocky Mountain National Park is its profusion of cliff-cradled, glacier-watered valleys unexcelled for wildness and the glory of their flowers. Here are lily pads growing in snow waters in Wild Basin, whose wealth of lake and precipice still remains unexploited and known to few.

The Three Arts

Agriculture

Manufacture

Transportation

The Department of Agriculture has completed a survey on the cost of producing beef in Northern Illinois that indicates that cattle cost the stockmen and farmers from $12 to $17 a hundredweight, delivered at the market.

The Bureau of Animal Industry has approved the eye test for detecting tuberculosis in cattle.

To answer a general demand for information concerning the possibility of citrous-growing in the South, the Department of Agriculture has covered the subject in Farmers' Bulletin 1122.

Business reviews forecast an increase in the cost of fertilizer materials.

Reports that a German scientist has succeeded in making artificial wool are incorrect. Experiments are being made but have not yet met with success.

More than one thousand tons of tomato seeds are thrown away annually by northern pulping plants. It is estimated that if reduced to oil and stock food this by-product would have a total value of $86,000.

Holland is again shipping considerable quantities of potato flour to the United States. The flour is used chiefly in this country for the sizing of paper.

Europe has made much more rapid progress in the recovery of her dairy industry than was deemed possible. As a result exports of condensed milk from this country dropped 89,000,000 pounds from June, 1919, to August, 1920. Conditions in the condensed milk industry are said to be critical. A large number of factories will close.

Large shipments of Danish butter have been received in the United States.

American vessels of more than 1,600 gross tonnage, which enter British ports after December 1, will be required to carry wireless.

Germany is now manufacturing a sole leather made from waste leather, which is suitable for the heels of shoes.

Owing to falling prices in food, clothing and other necessities, less than fifty executive workers are now employed by the Department of Justice in investigating charges of profiteering.

The three American delegates to the International Institute of Agriculture, which closed a 12-day session in Rome this week, were Dr. Thomas F. Hunt, dean of the college of agriculture of the University of California; Leon M. Estabrook, chief of the Bureau of Crop Estimates, and Harvey J. Sconce, former president of the Illinois Agricultural Association.

The government is encouraging in Alaska the development of crops adapted to the short growing season.

It is estimated that the upkeep of a light tractor capable of doing the work of four horses is $250 a year, while the cost of maintaining four horses is figured at $896 for the same period. Hay and feed for the horses are figured at $810, shoeing at $24, wear on harness at $12 and depreciation of horses at $50. The cost of fuel for a tractor for an average season is placed at $100, cost of repairs and overhaul at $50 and depreciation at $100. The net result is a saving of $646 for the farmer who uses a tractor.

Cotton mill workers in an eastern city have accepted a reduction of from 15 to 20 per cent in wages.

The officials of the Tanners' Council of Chicago report that cheaper shoes will be seen on the market soon, due to the decreased price of leather.

July was the greatest month in railroad history, in point of operation, according to the Federal Trade Commission. The total of ton miles was 40,232,000,000—an increase of 15.2 per cent over July, 1919.

The United States Shipping Board will dispose of all housing projects which it controls.

It has been announced that a Japanese company capitalized at $25,000,000 has been organized with the intention of entering upon the exploitation of any petroleum deposits that may be discovered on the west coast of Mexico.

Public utility plants produced electricity to the amount of 29,114,000,000 kilowatt-hours during the first eight months of the present year. Thirty-eight per cent of this was produced by water power.

Up to October 1, the United States exported 1,150 locomotives. This is more than were exported during all 1919.

English woolen manufacturers are turning out cheaper lines of cloth to meet the demand of the public for lower prices.

The International Bureau of Weights and Measures announces that the Swiss have succeeded in remedying variations in timekeeping due to the expansion and contraction of the parts of a watch.

Great Britain is about to begin research work in India to determine the feasibility of producing cheap power alcohol on a commercial basis.

The American Farm Bureau Federation will meet in Indianapolis, December 6, 7, 8, for the purpose of formulating a national agricultural policy.

Nine types of American farm tractors were entered in the International Farm Tractor Exhibition held in Rome.

Canada announces a fifty per cent increase in immigration. The British Isles furnish most of the newcomers.

According to news from Baltimore, garment workers in that city face a long period of unemployment. Many manufacturers are said to have cut down work to a day basis.

The relaxation in the iron and steel trade continues. It is estimated, however, that the mills are operating at 80 per cent of their capacity.

The total of cars loaded with commercial freight in the week ending October 9 reached 1,009,787.

"American business," says Warren G. Harding, President-elect, "is not a selfish, privilege-seeking monster. The agitator who so describes it and the statesman who treats it with abuse and suspicion, forget that American business is the daily labor of the whole people and the clothes upon their backs and three meals a day. More vital to the wage earners, who are ten to one greater in number than business executives, is the continued prosperity of America. Business in America is not big business; it is little businesses—all the units of production, even the single machine in the shop and the farm and the home. American business is a vast fabric woven through the up-going years by the daily tasks of a faithful, virtuous people."

Express rates, 1920; decided August 11, 1920. Commission report. Five cents. Superintendent of Documents, Washington, D. C.

Lloyds reports the gross tons of shipping under construction in American yards, September 30, as 1,772,000, or half that of a year ago.

Mexican imports for the first four months of 1920 were 92,000,000 pesos.

The right to explore oil lands in British possessions throughout the world has been granted to American companies. This is a reversal of the British policy.

The United States export trade to Asia and Oceania in 1920 will considerably exceed $1,000,000,000. To South America the total for 1920 will exceed $500,000,000 against $147,000,000 in 1913; to Africa $140,000,000 against $29,000,000 in 1913, and to Europe over $4,000,000,000 as against $1,500,000,000 in 1913.

After nine years' occupation of Korea by Japan, four-fifths of the total of 10,000,000 yen in the Postal Savings Bank belong to Japanese.

The Federal Foreign Finance Corporation, a $6,000,000 enterprise to finance foreign trade, was organized in New Orleans, November 6, at a meeting attended by 100 of the leading bankers of the South. The bank's purpose will be to finance the foreign marketing of all of the South's staple products and manufactures with particular attention to cotton, rice, sugar and lumber.

The Forestry Service announces that the use of wood preservatives is on the increase in the United States. Approximately 140,000,000 cubic feet of wood were treated in 108 plants during 1919.

The Department of Agriculture uses oil to stop sand sifting into cuts on the Columbia River highway.

Present figures indicate that the railroads of the United States will break all records this year for volume of freight transported.

Government officials believe that German manufacturers will invade the United States markets soon with goods priced far below the market.

Washington announces many farmers are carrying out their threat to hold crops for higher prices.

The Department of Agriculture of the Mexican Government expects to spend 600,000 pesos this year in purchasing agricultural machinery which will be retailed in turn to Mexican consumers. Two hundred thousand pesos are already available.

Under a Finnish law which takes effect January 1, the national government will build all highways.

It is said that the recent advance in Canadian freight rates has practically halted lumber shipments from the Prince Rupert consular district to the United States.

Charges that officials and employes of the United States Shipping Board have wasted millions of dollars and that there has been almost unlimited graft, are made in reports to the House Committee on Shipping Board Operations. So serious are the charges that it seems certain Congress will take cognizance of them immediately upon convening.

Canada is interested in the report that the Pennsylvania Railway, the Canadian Pacific, Essex Terminal and Canadian Steel Corporation are jointly interested in a plan for transportation and industrial development which will involve an expenditure of $200,000,000. Plans provide, it is said, for the entrance into Canada of the Pennsylvania lines over a new international bridge crossing the Detroit River.

A 30 per cent increase in toy production in the United States is predicted for 1921 by one of the chief toy manufacturers.

The nation's stock of gold amounts to $2,194,000,000. Of this sum $1,196,000,000 is held in vaults as a protection against panic. The United States holds about 33 per cent of the world's monetary supply of gold.

Briefly Told

The French Academy is giving deep consideration to the plan to admit into the French language such well-known terms as "full house," "flush," "straight," and other terms of poker. Benjamin Franklin introduced the famous game to France and the American terms were adopted into the vernacular. The "doughboy" of 1918 did much to popularize the game and pauperize the poilu novice.

Michael Condon, chief clerk of the University of Michigan, is dead after 62 years' service in the institution. He served under all of the five presidents of the university and saw it grow from two small buildings to become one of the largest educational centers in the United States.

A Lynn, Massachusetts, cook insisted that her employer transport her to church in a car every Sunday morning. He did so, but one morning an accident befell, wherein the cook was injured, and she now sues him for $10,000.

In a battle of ballots for election to the Hall of Fame, Mark Twain easily defeated his more vocabular opponent, Noah Webster.

A 75-year-old lady of Little Falls, New Jersey, cast her first vote on election day, and was dead 36 hours later.

The "solid South" showed the results of winter immigration from the North, many tourist towns in Florida, Texas and other Gulf States giving a heavy return for Harding.

Over 2,000 persons went through the White House gates three nights after election and cheered the President. Mr. Wilson was wheeled out in a chair and responded by bowing his head.

A "phantom herd" of buffaloes, reported for years by Indians to be grazing in the Mackenzie River Basin in the Canadian Northwest, has at last been discovered by a white man, F. H. Kitto, a Canadian engineer. He estimates the herd at 1,000 head and says the Indians of the country report a larger herd farther north.

Trotsky says: "I know danger is coming. I realize the possibility of a severe winter, but though three-fourths of the population die of hunger and cold, the remainder will survive to carry through to victory world revolution."

United States guards were recently removed from the international bridges between the city of Juarez, Mexico, and El Paso, Texas. Removal of the troops was due to the restoration of peaceful conditions in Mexico.

President Taft's son Robert has been elected to the Ohio house of representatives.

The bullfighters of Spain are considering concerted action with the object of obtaining higher pay.

Ludendorff's book on the war is judged by enemy officers to be the truest account thus far coming from the German side. He says the German Army was defeated and worn out in 1916.

Pedro Zamora, the last bandit leader in Mexico, has surrendered, together with 15 followers.

The next eclipse of the sun to be visible in the United States will occur in 1923.

A perfect substitute for radium has been produced through a chemical process which purifies mesothorium. Mesothorium is a by-product of gas-lamp mantles and is found in monazite ore.

Boston reports say that retail shoe prices have been reduced from $3 to $5 a pair on ordinary styles.

A shark in Saigon Harbor, Indo-China, failing to take a baited hook, was fed a large piece of pork containing chlorinated fresh lime. The action of the water on the lime caused an explosion which threw pieces of shark meat 300 yards away in the mangrove thickets.

After reading an interview by Eugene Debs, the London *Morning Post* is "emboldened to suggest that prolonged periods of seclusion (enforced if necessary) might be made part of the normal education of all politicians."

One New York hotel had 450 Cuban sugar millionaires among its guests. Then sugar slumped, and some of them had to borrow real cash to get home.

The United States uses approximately 48,670,000 barrels of oil in a month.

The sardine pack on the Maine coast aggregates 2,500,000 cases, worth $15,000,000. About 6,000 persons are employed.

The National Guard is to be kept at full strength in peacetime and will be available for minor emergencies according to a statement made by the Director of the War Plans Division of the General Staff.

"Pilgrim" half-dollars, 300,000 of them, have been issued by the United States Mint to commemorate this, the 300th year of the Pilgrims' landing.

Approximately 12,000,000 people live under the American flag outside of the continental area of the Union.

When William Jennings Bryan spoke at the University of Michigan, the largest auditorium in the state was too small by thousands of seats, and the Commoner had to repeat his address next day.

Forty-six per cent of all wood used in the nation is required on its farms.

At the foot of Mt. Ararat, the traditional resting place of Noah's Ark, the Armenians recently defeated the Turks.

More than 73 per cent of the workers in factories in Japan are women.

They are raising tobacco in Hampshire, England, for the first time since James I's "Counterblast to Tobacco" outlawed the industry, and Cromwell's troops trampled down the crops.

Houses advertised for sale in England are often seized by ex-service men, who install their families therein and offer to pay rent.

There are eight million unnaturalized aliens in this country.

Better grade of work in ready-made clothing is produced outside of New York. Yet in New York the wages of the clothing trade run from $55 to $85 a week, as against $25 to $35 elsewhere.

The British Government is using its obsolete warships as floating laboratories for the study of the formidable foot and mouth disease, and the discovery of a preventive or cure for it.

Ten wards in the city of Glasgow voted to abolish the saloons, the most revolutionary occurrence in Scotland in two centuries.

A total of 6,978 persons were killed and 149,053 injured on United States railroads during 1919.

William Hohenzollern has received more than $25,000,000 in salary as King of Prussia, since his flight to Holland.

The green iguana, a kind of lizard about three feet long, is a favorite food of the natives along the Amazon, and cannot easily be told from chicken.

E. O. Excell, noted singer and hymn-writer, was recently reported near death. He began life as a bricklayer, but one day Sam Jones, the evangelist, discovered him singing at his work.

A New York department store runs an elevator for men only from Fifth Avenue to the tenth floor where men's furnishings are sold.

Colonel House, of Texas, was President Wilson's "mystery man." Another Texan, F. E. Scobey, of San Antonio, is cast for the same part for Mr. Harding.

The unearthing of human skeletons measuring more than seven feet in length in California indicates that that state was once inhabited by a race of gigantic Indians.

"A man may buy that which he cannot own."

Mrs. Juliette Low, founder of the Girl Scout movement, is 70 years old.

Lloyd George has espoused the cause of prohibition in Great Britain.

Each time that the Russian Soviet Government has won a military victory, or saved itself by retreat, the operations have been directed by Leon Trotsky, minister of war, who is not a soldier. Trotsky's latest achievement has been the defeat of Wrangel's army in South Russia.

Alkali water affects ducks in much the same manner that certain indiscreet home brews bother men. At Dobson Lake, Oregon, thousands of ducks have died from drinking alkaline water, and the government is preparing to divert the remainder to a pure water lake near by.

The theft of British uniforms in Ireland has enabled Sinn Feiners to throw suspicion of violence on the British soldiery, according to statements made in Parliament. The term "uniformed men" instead of "soldiers" is beginning to appear in the dispatches.

Members of the wealthy Osage Indian nation have purchased airplanes for pleasure purposes.

Georgette Le Blanc, former wife of Maurice Maeterlinck, is in the United States.

American women paid $750,000,000 for rouge, lip sticks and powder and perfume during 1919, according to government war tax returns.

The end of Turkey is foreshadowed by the tripartite agreement entered into by Great Britain, Italy and France last August, and made public recently.

Iceland proposes to utilize her numerous waterfalls in carrying out an extensive program of water power distribution.

Berlin University has arranged a course of study on the British Empire.

The old Swiss watch, once so popular with the American people, has given first place to the modern American watch.

McAlester, Oklahoma, is reported to have come out "even" in the presidential election. Cox and Harding were given an equal number of votes.

Last year the United States produced $667,204,000 worth of rubber products.

A new "Congressman" is Alice Robertson, who runs a restaurant in Muskogee, Oklahoma. She did her campaigning while her customers ate their meals.

Alaska's population is 54,718, a decrease of 14.9 per cent in the last decade.

The proposed new constitution for Illinois includes the privilege of intermarriage between whites and Negroes, and provides equal rights for Negroes in every sphere.

One-armed veterans are employed in the factory of a London carriage manufacturer.

London's fog expert has a machine on which he weighs and otherwise records each fog that comes to Victoria street. The solid matter deposited by a fog weighs six tons per square mile. For all that, fogs of the "London particular" brand are diminishing year by year.

Pipe smoking seems to be on the increase among London women, and fashionable cigar stores display dainty small briars, some set with precious stones. It is said there is a growing demand for these.

Former German Crown Prince Frederick spends much time making horseshoes at the village blacksmith shop in Wierengen, Holland.

A Kansas college professor has established a wireless weather report service for farmers.

An instrument making it possible for the blind to hear the printed page was recently invented in England.

Radium valued at $13,000 was thrown into a wash basin by a patient in a Utica, New York, hospital who felt annoyed by its heat. It was later found in a sewer pipe near the hospital.

The Ford International Weekly

THE DEARBORN INDEPENDENT

By the Year *One Dollar* | Dearborn, Michigan, November 27, 1920 | Single Copy *Five Cents*

The Thoughtful Are the Thankful

THESE words are in season or out of season according as you view the Day of Thanksgiving as a period or a beginning. The date of this issue of THE DEARBORN INDEPENDENT is two days past the officially appointed Day, though many readers will receive it earlier.

But if this paper comes after the Thanksgiving feast, and these words fall under the eye of any who fancy that Thanksgiving is "over," because forsooth the 25th of November is past, the message may be that much more effective.

Thanksgiving is not a day on which we exercise our much neglected emotions of gratitude, and then lay them away for another year; it is a day when, if we use it wisely, we adopt an entirely new attitude toward life, or correct an attitude twisted sadly awry. We tend to fall into a very bad temper with regard to life and things in the grind of the workaday world, and one of the signs of this bad temper is to regard all we have received as a debt long owed to us, instead of a gift whose giving or whose taking is beyond us.

This is temper more than thought, and the function of thought is to correct the aberrations of temper.

Directly a man begins to think—not brood, nor fear, nor indulge the common human propensity to bathe in black forebodings—that moment he finds himself set in a way to thank.

Thinking always precedes thanking; the thoughtful mind is the thankful one.

There is nothing we have but what we have received, and the utmost effect which human labor has on the fundamentals is to establish our worthiness to receive it.

Life was given us. It is a great gift. We feel it to be a great gift, when we stop to think of it. Life is not a holiday, but a school, a discipline. It has its tests, its hard places from which neither money nor power, neither culture nor character can exempt us. All eyes weep betimes, all hearts ache. Everyone who has lived knows the pain of broken plans, the pain of revised visions. By the same token, all lives have known the fundamental joys, those joys which are essential in our humanity. Stripped of accidental gear, all lives are very much alike.

We have to be thankful that life is what it is, when we are thoughtful about it. Our freedom to change the fundamentals is limited and is exercised at our peril, but our freedom to adjust our reactions to them is almost boundless, and it is in this freedom that life finds its fullest abundance.

The fundamental blessings are life—sheer physical being; thought—the growing part of man; work—the forthputting of power; love—the activity of the higher nature; society—which begins and ends in the home, for society is composed not of separate individuals, but of groups bound together by ties of blood and of emotion.

Deprived of any one of these, all the accidentals of possession or place become dead. But these, the fundamentals, are the inheritance of all—the world is just that wisely ordered in the provinces where man's disturbing hand may not interfere.

Thanksgiving Day should mark a period when we begin anew to assay the ore of life. In order to appreciate, we must apprehend. We do not know what we are worth because we do not take stock; and we do not take stock as we should because we are slaves of the fallacy that Life can be reduced to material terms. When, after beating down all the high principles of the soul, we do at last reduce life to acres and dollars and tons, we look up from our work in a daze to find that the true values of life have fled. And we must seek them where we lost them, in the simplicities of thoughtfulness and duty.

Grant that life is largely conditioned by its material environment, even there, as a nation and a people, we have cause to make this Thanksgiving the point of a new departure in appreciation.

We have just passed through a period of perturbation and foreboding. The period of adjustment has been long delayed, longer than after most wars, giving us a breathing spell before the actual moment of accounting came. It has come. It promises not to be severe nor long drawn out.

These matters depend more than we realize on the spirit of people. The courage or depression of the public mind is an *economic fact*. It is, without the slightest doubt, one of the chief economic facts. Coins and commodities are not the chief economic facts by any means; they are the camp followers.

That, then, is a cause for gratitude, that the conditions which we have named economic, and have fancied hovering over us as uncontrollable as the storm clouds, are amenable to the spirit of the people.

Thankfulness growing out of thoughtfulness makes for a sound tone of mind; and out of this a spirit of courageous expectation arises; and out of this spirit comes the power to arrange the material environment aright. That is the code of prosperity: by being thankful, we create the causes of further thankfulness; by counting our blessings, we see them increase under our hand.

Many Men of Many Minds

Captain Francis McCullagh, correspondent.—Lenin's future is more uncertain than was ever the future of a Russian emperor. With a wilderness of blood and horror behind him, with a highly volcanic soil trembling beneath his feet, and with clouds of inky blackness veiling his future, few human beings have ever been enveloped in more tragic menace and mystery than this prosaic, common looking man. Outlawed by every government, anathematized by every church, cursed by his millions of victims, he can never leave Russia alive, he cannot stay in Russia and live.

Field Marshal von Hindenburg.—It was impossible for us to win after 1918, on account of the British blockade which, despite our sharpest submarine warfare, cut our food supply. Arrival of American troops broke the west front deadlock, added overwhelming power to the Allies and made possible their winning of the war. American attacks in the Argonne, our main line of retreat when we were shortening the line in Belgium and Northern France, actually won the war.

Roberto V. Pesqueira, Mexican Government agent.—As the United States must see, it is a new Mexico that faces the world in pride and confidence. From border to border there is peace. Not a single rebel remains in arms against the federal government, and a whole nation thinks in terms of law and order and reconstruction. On September 5 our citizens cast their votes in due accord with democratic procedure, and Alvaro Obregon, the great soldier-statesman chosen to be president, is supported not only by a coalition of parties, but by a union of faith and patriotism.

Alfred Amer, president of the Southern Interstate Hotel Association.—Aside from all the myriad benefits the prohibition of the liquor traffic has worked, it undoubtedly has had a beneficial effect on the hotel business throughout the country, despite statements of representatives of the liquor interests to the contrary. As a result of prohibition, the general public, every time it goes to a hotel, pays less for its accommodation and its food than it would have had to pay, under prevailing high costs, had liquor remained on sale.

Woods Hutchinson, M. D.—In future we are to eat in *nems* instead of calories, in "milks" instead of "coals." We shall measure our food by the milk jug instead of the coal scuttle.

Leo Pasvolsky.—Russia has ceased to exist as a nation and has merely become a powerful base of the world revolution. Moscow has ceased to represent Russia and has become the storm center of this rapidly gathering hurricane of destruction. A small group of men, chosen by the Second Congress of the Third or Communist International, is prepared to make a bid for greater world power than was ever dreamed of by Kaiser Wilhelm or any of his historic forerunners in the domain of world conquest.

Russia Is Simply Base for World Revolution

Viscount Kentaro Kaneko, president of the American-Japan society.—History shows that Japanese-American relations are inseparable. Yet, today, to my great sorrow, there are some Americans who disregard this history, misunderstand the mind of the Japanese and try to destroy the friendly relations between the two countries.

C. C. Nieh, president of Shanghai Chamber of Commerce.—We have used America as our model; China wants to become modern. We are seeking the light of Christian principles, both in our civic and industrial life. The American Y. M. C. A. is the greatest factor in China today. The organization has made it possible for thousands of Chinese students to obtain an advanced education in America. These young men and women return to China to become leaders in the civic, professional, industrial and commercial life of that country.

Harriet Connor Browne.—Out of every dollar we appropriate, do we want to spend over 68 cents for debts on past wars, over 20 cents to build up a big army and navy to handle future wars, leaving less than 12 cents with which to develop our farms and forests, our roads and schools, fight disease and establish social justice?

General Leonard Wood.—This country is governed by public opinion. Intelligent public opinion cannot be built up without honest and widespread publicity, publicity which is based upon intelligent findings of facts.

Forsythe Sherfesee, forestry adviser to the Chinese Ministry of Agriculture.—Scanty as is the total precipitation over North China, it is still sufficient to relieve the country from most of the drought damage from which it suffers if it were so conserved and managed as to become available during the necessary periods of little or no rainfall. And it is in this respect that forests unquestionably are of the very first importance; for a forest cover converts a watershed into nothing more or less than a huge natural reservoir, or figuratively speaking, an enormous sponge which absorbs the water as it falls and later gives it out slowly and comparatively regularly when it is needed.

Calvin Coolidge.—More than the fundamentals of character building and of education we have a right, as a people, to expect from the public schools that they shall in very truth be the cradle of an American character. That, so far as the nation is concerned, is the great obligation and responsibility and opportunity of the public schools—to be the cradle of an American character. To discharge that commission successfully, what have the people a right to expect that the public schools shall teach? Is it not, first of all, love of God in all his manifestations and respect for those who reverence God in their own way? Is it not also respect for law as a first step toward obedience to the law? Respect for law if inculcated in the future citizens of America will inevitably make them obedient to the law and constitute one of the first evidences that they are true Americans.

First Duty of Our Schools as Seen by Gov. Coolidge

Charles J. Mead.—Protection is the only method by which America can retain her position as the leading creditor nation of the world, a position she is fast losing under a free trade régime, as European and other nations gradually get back to normal conditions.

Edward B. Bruce, president of the Pacific Development Corporation.—The Chinese are essentially a peace-loving, law-abiding people, and today you can do business in China with firms that have been in continuous existence and have met their every obligation for over 600 years. Is such a firm, with such a record, a poor business risk? In all the history of China, so far as I know, and I have taken special pains to find out, China has never defaulted on a single foreign obligation. Do you wonder that a people knowing this and proud of their record resent the imputation that an army is a necessary witness to a contract?

William C. Gregg, correspondent.—A bill has passed the United States Senate and is pending in the House giving about eight thousand acres of the Yellowstone National Park to Idaho irrigationists. There are more falls and cascades in this small corner than in all the rest of the park put together. A two-hundred-foot dam can be thrown across the Falls River Canon outside the park that will store probably twice as much water as is proposed in the park. Idaho, adjacent to the park, and so much interested in it, certainly does not know—cannot know—that there is water storage outside the park and that her proposed invasion is as inexcusable as it is shortsighted.

Woodrow Wilson.—In plenty, security and peace, our virtuous and self-reliant people face the future, its duties and its opportunities. May we have vision to discern our duties; the strength, both of hand and resolve, to discharge them; and the soundness of heart to realize that the truest opportunities are those of service.

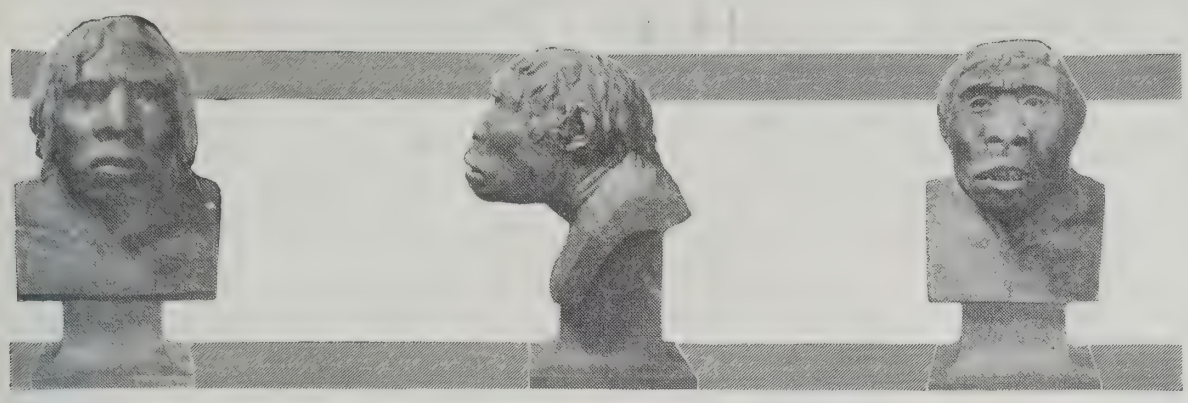
General Bramwell Booth, head of the Salvation Army.—The war is over and now the most crying need of the world is the need of assisting depressed humanity. India, Japan and, in a lesser degree, China are today breaking down the prejudices of centuries and opening themselves to the forces of progress and reformation. Prohibition is sweeping the world. But it is education that is needed, for reformation cannot be brought about by legislation.

Alvaro Obregon, president-elect of Mexico.—My mind is fully made up to give all necessary aid to the development of agriculture. There is a law which permits the introduction into the country of all classes of agricultural machinery and farm implements free of duty. This law will be observed and importation of farm machinery will be encouraged. Experiment stations will be established and stimulus given to all branches of agriculture, with special attention to those products which are referred to as articles of export.

David Lloyd George.—Bolshevism will pass away. If Russia falls into the hands of anarchy it may be a generation before it is redeemed. It is a dead loss to Europe. It is worse—it is a festering thing which will poison the atmosphere of the world. Therefore, in spite of everything, we persevered to try to secure peace. I know the difficulties—thwarted by suspicions on all hands in Russia, in Europe, in Britain, divided purpose in Russia, divided purpose in Europe, and, above all—there is no use pretending—we have been dealing with men who, unfortunately, did not realize how important it is that they should respect their own obligations. In spite of all that we mean to persevere, because we realize the danger of a Russia sunken and sodden in anarchy.

S. S. Frazer, secretary, Texas Cotton Ginners' Association.—The people have been living too easy for the last few years. Anybody could make a living without much effort and they expect these conditions to continue. The time has come now, however, when people are really going to have to work for a living. The old teaching that man shall live by the sweat of his brow still holds good, and this is the only way he can live.

Herbert Hoover.—No one shrinks from asking for charitable support more than I do, yet my chief occupation for five awful years has been begging at the feet of the civilized world. I cannot promise never to beg again, but I can pray with the rest of you for such rapid improvement in world conditions that I shall never again find it necessary. There are thousands of American families, both native and foreign-born, who out of their prosperity can afford to help the helpless children of Europe to live through this winter of their distress. The head office of the American Relief Administration is 42 Broadway, New York.



Crawford Vaughan, former premier of South Australia.—Australia deliberately adopted the American constitutional model, applying it to a dominion of a monarchial empire. It seems to me that this must be the form of any imperial constitution adopted for the British Empire. The powers of the imperial Parliament must be strictly defined, the remaining powers being vested in the states. Such powers, for instance, as the making of peace or war, the supreme control, subject to similar limitations as those now existing, of the army and navy, the ambassadorial representation abroad, the conclusion of foreign political treaties (not necessarily binding any state without its consent)—these are typical of the powers that might be conferred upon the central authority.

British Imperial Constitution in Statesman's Eyes

Dr. H. C. Taylor, chief, Farm Management Bureau, Department of Agriculture.—Farmers will not burn corn instead of coal unless they are driven to it by economic necessity. If the prices of farm products are adjusted to pre-war levels no more rapidly than are the prices of things the farmer must buy, agriculture can be counted upon to continue the course it has taken for many years, but if the prices of farm products fall and the prices of other things remain high, the farmer will be compelled to reorganize his business on a more nearly self-sufficing basis, produce more largely to satisfy his own wants and give less attention to production for the market. This would result in a decrease in the commercial supply of farm products.

Alfredo Pimenta, Portuguese writer.—Without public order no nation can live and maintain itself, and for 12 years past there has been no government in Portugal that has mastered this question of the maintenance of public order.

Going Back a Half Million Years: A Hunt for the "Missing Link"

NEANDERTHAL MAN
—Restoration by McGregor.

PITHECANTHROPUS OF 500,000 YEARS AGO
Front and profile, as restored by McGregor.

MINING for Adam, the original of the homogenous, or for Jocko, his cousin, the progenitor of our scratchiferous relatives, the gorilla, the orang and the chimpanzee, is by no means a simple affair. Rather it is a matter of refined diplomacy, of fluent linguistics, skilled engineering, deep scientific and historical knowledge and hard and patient work, according to Roy Chapman Andrews and Walter Granger, botanist and paleontologist respectively for the American Museum of Natural History.

These two men are in charge of plans for the most pretentious expedition into ancient times ever planned. Together with geologists, archeologists, zoologists, anthropologists, and various other kinds of scientific investigators, they expect to sail from San Francisco February 1, 1921. Their destination is a rather indefinite point in chronology, which we may place roughly at 500,000 years B. C.

The entire expedition plans to make the round trip to the far-ago era within five years. Somewhere in the subsoil of half a million years ago, the paleontologists hope to find the physical remains of our more or less disreputable antecedents.

Remnants of our ancestors in the shape of a stray molar or two, a petrified cheek, and a worn-out jawbone or so, are to be brought back and placed in the Asiatic Building of the museum in New York. There these revered relics will be mounted and placed where Americans who dote on ancestors may come and worship.

Chief among the objects sought is the "Missing Link," which modern scientists believe spans the interval between manlike monkeys and monkey-like men. Whether the Third Asiatic Expedition, as the prospectors for old Adam are to be called, finds the remains of the highly civilized ape, the least civilized man, or the being in which monkey and man divide fifty-fifty, members expect important discoveries.

The mystery of Central Asia which the American savants seek to pierce has always been a fruitful source of speculation. To dissolve this mystery, even the most modern portion of it, is a serious task. To attempt to read the record of the ages which Nature has sought to conceal by upheavals of strata, by glacial scrapings, and by shifting sands, is a proceeding against which even the spirits of heathen gods fight through the superstitious minds of native idolaters.

But the mystery, in both its modern and ancient aspects, the members of the expedition propose to solve. And they expect to bring back to America a collection of Central Asiatic discoveries which will make the American Museum the repository for the largest number of concrete bits of Asiatic knowledge in the world. Specimens of the present-day fauna and flora of Tibet and Mongolia, together with fossil remains of the obsolete animals which roamed the district science has accepted as the birthplace of the human race are among the relics sought.

WALTER GRANGER
Paleontologist of the expedition.

The expedition is being financed by J. P. Morgan, George F. Baker, W. A. Harriman, and several other wealthy patrons of the museum.

The personnel which is being arranged by the associate curator of mammals, Mr. Andrews, will include an imposing array of individuals.

There will be linguists able to converse fluently with the half-wild, little-known tribes of interior China, whose language partakes more of a jerky system of noun designation which was a characteristic of early races than of the well-rounded sentence construction of modern peoples.

Diplomats able to smooth away the fears and evade the superstitions of these strange races are among the important members of the party.

The hill tribes and plainsmen of interior China in themselves are studies which will adequately satisfy the desires of the expedition. Little is known of the living natives of Asia. The remnants of about 30 odd tribes are disappearing, yet almost nothing is known of their origin. One of these races, the Lolos, contains physiognomical traits akin to those of the Caucasians.

Should the linguistic and diplomatistic skill of the expedition be sufficient, its members are hopeful that inquiry among these tribes will enable much of the relationship between the various races of men to be determined. Central Asia is the territory from which the Neanderthals, first of the known races of men, invaded Europe. These beings, of small chin and retruding foreheads, were nevertheless of known large cranial capacity. From Asia, paleontologists believe, by means of the land-bridge which once existed at Bering Straits, the first of the American Indians came to this continent. The Asiatic expedition members hope to trace in Central Asia the featural resemblances of the Indians to modern Caucasians.

Perhaps the greatest test of the diplomatic skill will come when the members of the expedition seek to enter Tibet. This forbidden land, although nominally under the sovereignty of China, has actually been for centuries under the rule of the Dalai Lama, who today is practically the only survival of the ancient combination of spiritual and temporal power.

The present Dalai Lama rejoices in the name Ah-wang-lo-pu-tsang-to-pu-tan-chia-ta-chi-chai-wang-chie-chueh-le-lang-chieh. He is 38 years old, quite a remarkable age for a Dalai Lama by the way. The Grand Lama, despite the fact that he is the personification of all spiritual and temporal power, had previously had a habit of dying when he reached the age of 20.

Under Tibetan belief, the Dalai Lama is the reincarnation of one of the avatars of Buddha. The divine essence or spirit lingers for a time in the body of the Lama, then tiring of its physical abode, departs and enters the body of a new-born child. This departure and entrance to a new body of the great god's soul is always accompanied by a series of remarkable portents which increase the superstitious awe of the Tibetans, although the omens always have worked out in accordance with the desires of the bureaucratic priesthood which continues to rule, Buddha or no Buddha.

The present Lama seems to have been of a hardier type than his predecessors, or possibly Buddha likes Ah-Wang-Etcetera's body the best. Anyhow he has lived long past the age at which Buddhas are supposed to change their abodes. Eight years ago when the Younghusband expedition went into Tibet, the Grand Lama fled from Lhassa. Later he returned and since that date the Tibetans have concluded treaties with the British Government whereby the English agree no further exploring expeditions shall cross the Himalayas in return for the promise of the Tibetans not to ravage any of the Hindu cities. These treaties have cut down the number of efforts to unveil Tibetan mysteries. The Third Asiatic Expedition, however, coming from the north and east has a chance of learning some of the secrets of the land of the Grand Lamas. Just how much the learning will include depends on the success of the American scientist-diplomats in allaying the fears of the fanatically religious natives who believe that their immortal souls are creatures of Buddha.

Farther north in Mongolia and East Turkestan, with a special reference to the Gobi Desert, some of the difficulties of the searchers will be less. But the physical difficulties of the expedition will be correspondingly greater.

And here it is that the real important work of the scientists lies.

Here, according to Mr. Granger, the actual mining for the fossil remnants of the world's oldest races must be carried on.

"The reasons which induce us to go to Central Asia to seek traces of the original men are not the result of guesswork," said Mr. Granger, "and the work we shall do there will not be haphazard. Research of nearly all science during the past century has pointed toward that district.

ROY CHAPMAN ANDREWS
Botanist of the American Museum of Natural History, who, with Mr. Granger, is planning trip into Asia to hunt for "Missing Link."

"The scientific and historic records show that the Neanderthals, the first race known to have overrun Europe, came from Central Asia. American Indians show facial resemblances to the Mongols. The accepted theory is that the American aborigines reached this continent from Asia by the land-bridge.

"In the territory we shall visit, conditions are favorable to discoveries of pre-historic men. The chief of those conditions is that the great portion of the soil is loess, or wind-blown soil. It is under this kind of soil that fossils are most frequently found. Granite or lava formations or any kind of soil which owes its present condition to a melting process can, of course, have no fossil remains. But under the shifting loess, perhaps hundreds of feet down, we may expect fossils to lie.

"The search for such fossils is merely a matter of knowing where to go and going there. We proceed along canyons, river beds or depressions of other kinds. To persons trained and experienced in fossil-mining there comes almost as by intuition the knowledge of the place where the remains may be found. Science will learn much even though only a few relics reward the search.

"The last great find dealing with the origin of man was the pithecanthropus fossil remains, consisting of part of a skull, two molar teeth and a thigh bone. On these few relics, theories have been constructed of the race 500,000 years ago. Another momentous discovery was that of the so-called Heidelberg man, whose existence is placed at about 250,000 years ago.

"We do not expect any easy time in excavating for fossils. In fact we require a diplomacy even more skillful than will the members of the expedition who try to learn the secrets of the living races in Tibet. Our diplomats must combat deep superstition.

"Natives of Central Asia have long looked on fossil remains as having wonderful medicinal qualities. Fossil remains of mastodons, mammoths, horses, reptiles and men are alike revered. The remains are known as "Dragons' Teeth."

The advance guard of the expedition will leave in February and will establish headquarters in Pekin. There the aid of the existing Chinese Government will be obtained.

With a gradually increasing personnel, the expedition will move slowly into the interior.

The first year is to be devoted almost entirely to the study of zoology and paleontology. The researches in those lines can be carried on in connection with the vastly important efforts of gaining the friendship and confidence of the natives, as the exploring party moves toward inner Mongolia or Tibet, whichever seems the most feasible scene for early investigations.

In the second year the expedition leaders hope and expect to gain entrance to the Mongolian and Tibetan fastnesses. A geologist will join the party and together with the paleontologists he will study soil and strata conditions with a view to determining the proper places for the excavations for the progenitors of the race. In the third, fourth and fifth years, archeologists and anthropologists will appear.

Science is already rubbing its hands in gleeful anticipation of the results in fossil and living findings and in groundwork for deductions.

As for the rest of us, we shall probably take a few looks at our newly unearthed old ancestors, shudder at their archaic style of beauty, and then agree with Mrs. Edward M. House, wife of Colonel House. Mrs. House recently visited the Museum of Natural History and saw the reconstructed Pithecanthropus and Neanderthal men. She believes in self-determination of ancestors.

"You may have those awful looking creatures for your ancestors, if you desire," was Mrs. House's comment, "but for my part I shall take Adam and Eve."

What Victory Meant for Them

THE Versailles Treaty has ended the careers of four of the men who penned their names to that historical document. And one of the two remaining leaders of Allied thought balances his political self perilously through the medium of a coalition government.

The Versailles Treaty satisfied no one, least of all seemingly the people of the countries who had emerged victorious from the war, and had dictated the terms of peace to the Central Powers.

France's dissatisfaction early was manifested, and since that dissatisfaction became pronounced we have witnessed the terrible Tiger, claws sheathed, writing fiction for an American magazine.

Then there was the Baron Orlando, over whose head the President of the United States appealed to the Italian people. The Italian people responded to neither statesman. They repudiated the Wilsonian suggestions and later repudiated the man who had opposed Wilson. It was a little matter of Adriatic coastline territory, among other things, that upset the equilibrium of the Latins. As a result, the name of Orlando not only has disappeared from Page One, it's not even mentioned in the dispatches.

Came the "solemn referendum" in the United States. And we awakened on the morning of November 3 to behold a Solid South shattered for the first time since 1868.

Of even more recent date is the telling of the sad story of one Venizelos, hailed not so long ago as the foremost statesman of Europe, the savior of Greece, and as one who had brought his country to a world importance impossible save for the leadership of him who held the trust and devotion of the people of Greece. And what did this solemn referendum disclose? That the people of Greece were as fully unappreciative of what had been done for them as they were appreciative of what had been done to them. And so Venizelos, Liberator of Greece, is about to become an exile, if an even more tragic fate does not thwart this plan.

So we come to Lloyd George, and Saionji, of Japan. The former not only has been a victim of much criticism over his foreign policy, especially that part which has to do with relations with Russia, but domestic affairs have been becoming more and more unruly and perturbing. In by-elections the swing away from the coalition has been marked.

Every silk mill in Japan is closed, and the war prosperity has been replaced by a misery and discontent that has reacted strongly against the government. So far Mr. Saionji, the capable Japanese who obtained so much for his empire at the so-called peace table in France, has weathered the storm at home.

Perhaps, just perhaps, of course, if there had been a bit of justice tempered with mercy, and a moment's consulting now and then of the Fourteen Points that made the end of the war possible, there would be less discontent, less uncertainty in government in the world today. But statesmen gathered, and played according to the only rules they knew.

Such is the fate of statesmen.

The Price of Success

A MAN to whom success had come solely as the result of his own persistent efforts always kept in a prominent place above his desk a card which contained seven questions:

"You want success. Are you willing to pay the price for it?

"How much discouragement can you stand?

"How much bruising can you take?

"How long can you hang on in face of obstacles?

"Have you the grit to try to do what others have failed to do?

"Can you go up against skepticism, ridicule, friendly advice to quit, without flinching?

"Are you strong on the finish as well as quick at the start?

"Success is sold in the open market. You can buy it—I can buy it—any man can buy it who is willing to pay the price."

The chief reason why so many people do not attain success is that they do not desire it strongly enough to pay the price. They become discouraged at the failures which are sure to attend their initial efforts. They think that they have only to hitch their wagon to a star, and the star will draw them skyward. They would like to get to the summit, but they want to ride instead of making their way up on foot.

An army of young men and women enters the success contest every year. They are fresh from the schools and colleges, the farms and the cities. They have set their aim high—they desire success. The sad part of it is that the majority of them will fail to attain the goal—not because their brain power is deficient, not on account of their bodily strength giving way, not for the reason that there are not opportunities to succeed on every hand, but because when the time comes for success to exact payment from them, they will not pay the price. And the one price that every man and woman must pay if they ever achieve success is work.

It is work that breaks down the barriers, and overcomes obstacles, and surmounts the difficulties that are found on the road to success. It is work that pushes aside everything that may be in the way of the aspirant for the prize.

"Work, Work, Work," was the motto of Sir Joshua Reynolds.

Voltaire's motto was *"Toujours au travail"*—"Always at work."

Scott's maxim was "Never be doing nothing." He was a phenomenal worker. The Waverly novels were written at the rate of twelve volumes a year.

It is said that Michael Angelo always kept a block of marble in his bedroom, so that whenever he could not sleep at night he might get up and work, that no time need be wasted.

A lady once asked Turner the secret of his great success as a painter. His reply was: "I have no secret, Madam, but hard work."

Thomas A. Edison is a living example of how a man may win success by keeping everlastingly at it.

"The gods sell anything to everybody at a fair price," says Emerson.

Do you want success? It may be yours if you will but pay the price.

Mr. Harding in Panama

JUST as Senator Harding was preparing to leave for his visit to the Panama Canal the official publication of the Canal Zone announced that the big waterway showed an operating profit of $2,387,599 for the last fiscal year. Undoubtedly the news gave Mr. Harding food for reflection on the journey.

It is well known that the President-elect has favored giving American ships free use of the canal and that he is expected to recommend to Congress the reenactment of the measure providing such privileges. He was one of the strongest opponents of President Wilson at the time that executive forced a repeal of the law giving free tolls to vessels flying our flag and he has not indicated anything which causes the belief that he has changed his opinion.

At the same time the visit of the President-elect to the canal may be taken as evidence that he has not closed his mind to the subject, that he is willing and anxious to know the facts and that he proposes to get as many of them as he can at first hand.

One thing which Mr. Harding will undoubtedly consider is the extent to which American ships contributed to the canal earnings and whether the loss of the tolls they paid would turn this surplus into a deficit. Against this he will need to balance the importance of the newly-built American merchant marine, and finally he will have to weigh them both in relation to our changed relations with the nations since the repeal of the free tolls measure, considering particularly our present position on the subject of the Treaty of Versailles with its Covenant of the League of Nations.

All things considered, it is probable that Senator Harding is doing a very wise thing in going to the Canal Zone to study matters at first hand just now, and it is certain that one result of his visit will be to add to the nation's confidence in his judgment when the time comes for him to pronounce it.

Leave Russia's Troubles to Russia

GENERAL WRANGEL'S army has been destroyed, wiped out in fact, and no longer constitutes a menace to the present Soviet Government. So endeth the fourth tragedy—Denikine, Kolchak, Yudenitch and Wrangel—in the book of Russian blunders of European statesmen.

This latest disaster will, it is to be hoped, convince continental Europe that bad as the present government may be, it is folly to attempt to overthrow it by employing adherents of the old czarist régime, or by working from the outside. In truth, the results of such efforts are worse than folly, for not only have they all met with failure, but each failure has strengthened the grip of Lenin and his tribe and has prolonged their days of power.

France alone of all Russia's former allies has persistently refused to admit that this is so. It was France who was responsible for Wrangel and it is France that must bear the responsibility for the latest success of the armies of Communism.

There were two clear courses open in dealing with Russia. One was to treat her as an enemy and make war upon her; the other was to leave her alone to work out her own destiny. The first course could not be followed because the people of neither Great Britain, France nor of Italy were willing to fight Russia. The second course could easily have been followed but because of the love of European statesmen for meddling, it was abandoned and instead of keeping to the broad, clear way, the Foreign Offices went stumbling off into a jungle of intrigue and underhand alliances with any adventurer who was willing to take a chance against Lenin.

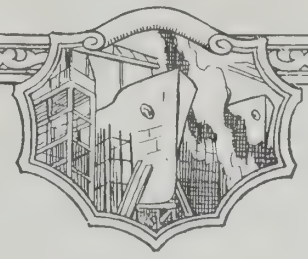
It is all very well for Lenin to preach internationalism to the world, but the only way he can maintain his power is to keep the flame of nationalism alive at home. As long as he can point to the fact that the enemies of Communism are reactionary left-overs of czarism and are drawing their support from foreign governments, he can rally the factions which fight him at home and turn them against the outside, for it is the old game of employing a counter-irritant to distract the attention of your enemies and Europe furnishes Lenin the opportunity. We in this country saw how the principle worked in our dealings with Mexico. Unpopular as Huerta was, he was not half so unpopular as we were when we intervened to assist in unseating him. All the factions forgot their domestic differences and wanted a shot at us.

Events have proved the wisdom of the course taken by the United States in Poland. The rest of the world can apply it to Russia with good results. Let Russia alone.

Lenin has troubles enough to please even France. The people of the cities have no work and consequently no money with which to buy food. The peasants have food but they refuse to part with it without pay and Lenin dares not force them to accept the worthless Communist scrip. They are the weak link in his chain as it is and he dares not put too much pressure on them for fear their patience may snap.

German and English delegations have visited Russia to observe the workings of the Soviet and have returned with reports which have turned labor in their countries solidly against the doctrines of Communism. This fact alone constitutes a greater safeguard to Europe than any amount of military missionary work.

Left alone Bolshevism will hang itself and with Wrangel's failure driving home for the fourth time the lesson that intervention only delays this happy event, it may be hoped that the point will be seen and its significance retained.



The Next Postmaster

IT IS too much to expect that the American postal service will undergo any change for the better during the last few months of the present administration. It is not too much to expect that with the Republican administration we may see the appointment of a man who will undertake the regeneration of the service.

Salaries should be raised, the weeding out of the unfit and the appointment of the fit should be undertaken, and, what is most important, there should be a definite policy that would bring about a restoration of the morale that once made the American postal service the most efficient organization of its kind in the world.

And above all, let us not have a profit fetish such as that which has caused the ruin of the service.

Mr. Ford's Page

A NUMBER of people here and there have been discussing the Pilgrims, who come to these shores three centuries ago and began a community life which has borne their impress more or less ever since. Many persons seem to have a grudge against the Pilgrims. It is half amusing to hear the descendants of later Pilgrims of another class berate the Mayflower passenger list.

There is a very distinct tendency observable in many quarters and under many guises to change romantic administration of the Pilgrims into a critical contempt for them, not for the purpose of getting a true light on the men and women who landed at Plymouth, but for the purpose of weakening the idea which has come to us from that little company.

It is true that we owe certain traditions to the Pilgrims which we can throw off or not, as we choose. But it is a question whether the only possible substitute would not be a step down.

The Pilgrims were moralists, who saw the world in the light of a moral government, and if this conception is unwelcome to the men of today it is because it conflicts with certain degenerate tendencies. Man, even at his worst, is something of a reasoning being; and whenever he wishes to go in a direction against which the old tradition militates, his first act is consciously or unconsciously to formulate a new philosophy which sanctions what he wishes to do.

But it is probably true that when most of the so-called "blue laws" are examined in a spirit of fairness, they may be viewed as attempts to nip in the bud a number of tendencies whose lush maturity at the present day constitutes our most serious problems. As a nation we might have been more somber had we kept the spirit of the Pilgrims, but certainly we should have been sounder.

For a long time, though dead, the Pilgrims formed the conscience of the nation, and even now the bitterness with which many speak of them would indicate that they still form an uncomfortable part of the national conscience. One of the signs of a normal conscience is its power to cause discomfort.

The Pilgrims were adventurers and pioneers so far as the material world is concerned, but they were conservatives in the world of idea. They were not seeking to establish the untried and unproved, but were protesting against that which had been superimposed to the great disadvantage of the tried and proved. And so, it was a new land they sought, but not a new mode of society; they sought rather the oldest and most natural form of society, that which was governed by the community spirit, in which freedom and responsibility balanced each other.

They were only a few score folk; and the pioneers are always few in number. That is one of the compensations of the pioneer, that he is at once relieved of the crowd.

The difficulty comes when the pioneer believes himself to be a constable armed with a warrant to drag the whole world into the path he is breaking. The true pioneer does not regard himself as a constable. He breaks his path in the serene confidence that if it is a good way to the desired objective, the rest of the world will soon make it a wide, well-trodden road.

The Pilgrim sought something for himself, but it is a law of life that when one seeks good for himself he is also finding it for others, if it be a real good.

It may even be said that he sought special privileges for himself, and special privileges are not to be condemned if they be good; for it is the history of special privileges, if they be good, that they become the general privilege and then the established right, because they are good.

Every right we have today was first a "special privilege." One class gained it, and then another, until it became the publicly secured right of all.

***THE PILGRIMS** were men who listened to their leadings and obeyed. They were not different from others, save in that. And they found that their leadings did not betray them. The voyage did not constitute their great achievement; it was their willingness to change their sphere of life for an Idea. It is the Pilgrim test. That is where most of us fail. Are you willing to come down in order to go up? If you are, then you may consider yourself emancipated from the most prevalent fear that exists today. To be what we may, many of us have got to start again, and to start again we have got to go back, and that is where most of us say to our Leading—"No, I'm afraid to do that." But the Pilgrims DID IT.*

The Pilgrims had also a religious faith, which has this advantage for pioneers, it saves them from feverish impatience. When a man believes only in himself, he is impatient to get things done in his own day, and if he fails, the hope of his life goes out in incurable disappointment. But if a man believes in the moral government of the universe, if he believes that the right is not wholly dependent on him, though his own moral manhood may depend on his loyalty to the right, then he has a secret key to the apparent slowness with which the Right assumes its reign. He does not overstep himself in his haste. He does not resort to coercion. He waits in confidence, making it his main concern that he be true at the post of duty to which destiny may have assigned him.

But what of the Pilgrims of today? Where would one go today to be a Pilgrim, the earth being so well subdued in its material sphere, at least seemingly so.

Even the Pilgrims did not escape human society; no man can do that by merely traveling, his main avenue of escape is in himself. And it was not human society from which the Pilgrims desired to escape so much as they desired to escape *to* a society more human.

This is a question hardly worth discussion, because the discussion is usually carried on by and for those who are not and never will be Pilgrims in any sphere whatsoever. It is surprising how few there are in any generation who have the Pilgrims spirit.

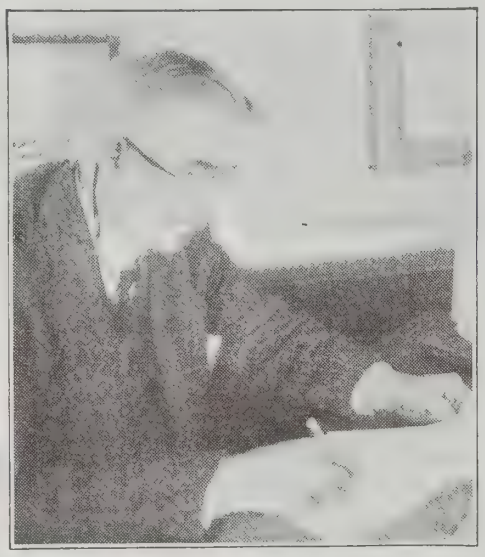
The Pilgrims were city people, to begin with, men with trades. It was not so much their crossing the ocean as their entrance upon an agricultural existence that constituted their daring. They went from the city to the land, and they went to untamed land at that.

This is a point very often overlooked. None of the orators and writers seem to think it worthy of mention. Yet when you consider the Pilgrims as they were, and then the conditions they came to, you will see that it is not a minor point.

That avenue is still open. There is more land available today than the Pilgrims could get. Yet the human pilgrimage does not turn that way. Men are enamored of what they think is their physical comfort, although as a matter of fact much of the physical comfort of today is simply the opposite thing. Men are not comfortable in their bodies under an unnatural mode of life, no matter how comfortable the appointments of a modern house may appear to be.

Men today would do many things if they were guaranteed against loss. If the government would carry us, or someone would nurse us along, and treat us tenderly, we would be willing to do a number of things. And for that reason a number of things are not done—the spirit of the pioneer is not in us. If it were, we would follow its bidding and go where it led, and we would then find that it has secret resources which had been unsuspected before. There seems to be a reservoir of strength and illumination and courage waiting to be of service to the spirit that will venture forth in obedience to guidance. It is not luck but Providence that has provided caches of supplies along paths still invisible, but waiting to be broken by the obedient feet of the pioneer.

Young men especially, who have not as yet so committed themselves that they are speculating with the lives or rights of others, need to know this, that, as the Pilgrims found wild food and a spring of water, so the pioneer in every field finds that the Spirit has preceded him, arranging that his tests shall not be too severe.



It is of no avail to advise anyone to be a Pilgrim in any sphere. The Pilgrim is born, not made. Like the wild fowl, he hears the call of another clime and wings his way thither.

But there are many Americas in other spheres, still waiting. There are Plymouth Rocks jutting from many shores to receive adventurous feet The surface of the world may be populated, but the secrets of the soil beneath and the secrets of the spheres above still wait silently for the sailing of new Mayflowers.

He Put Citizenship Into the Curriculum

By ZOE HARTMAN

CAN citizenship be taught in the public schools, like arithmetic or, perhaps, physics—by the laboratory method? A Chicago principal, Professor John L. Lewis, graduate of historic Oxford University and postgraduate of the School of Faith in Humanity, says it can be done and has proved it by establishing a real laboratory of citizenship, in which he has been conducting a remarkable sociological experiment. Thirteen years ago, when he became principal of the Raymond Public School, its reputation as one of the "toughest" schools in Chicago was well enough earned to daunt the stoutest pedagogical heart. Situated in one of the most congested districts, with a small percentage of its attendance colored, it had a strongly unruly element that had long menaced discipline and educational progress.

PROF. JOHN L. LEWIS
Principal, Raymond School

In the words of Professor Lewis: "It was not a school at all, but a group of rooms. No pupil had any respect for anyone but his own teacher and the principal—and none too much for them. The disregard of law and order was simply staggering. The first few months of my régime, I was frequently called upon to go out on the street and settle shooting affrays among the older boys. The walls of recitation rooms and halls were defiled with obscenities—the only form of schoolroom decoration the school had at the time. I was told that the pupils were hopelessly bad."

Yet today, with 95 per cent of its pupils colored and the neighborhood more congested than ever, the Raymond School stands a model among public school discipline, good manners and school loyalty.

What's the answer? Self-government—real, aggressive, democratic self-government in the schoolroom, which Professor Lewis has been working for the last twenty years to perfect. Among his 800 pupils, most of whom he knows personally, he founded the Law and Order League of the Raymond School, with branches in every room above the second grade. Its purpose is set forth in the preamble of its constitution, which in imitation of the more illustrious Federal document reads: "We, the pupils of the Raymond School, pledge ourselves to do all we can to uphold the law of the state, the ordinances of the city of Chicago, and the rules of the board of education; and we will use every endeavor to raise the citizenship of the members to the highest point of efficiency, and in order to accomplish these ends, a league is hereby constituted." The details of organization, as well as the various provisions of the constitution, have been worked out largely by the pupils, with the aid of suggestions from the teachers and Professor Lewis, so it is not a case of a ready-made government autocratically imposed on the school by the authorities.

The room leagues are formed when two-thirds of the pupils of a grade, all in good standing, sign their names to the league pledge, which is usually tacked up at a conspicuous place in each classroom, with plenty of room below for the pupils' signatures. This is the common method of enrolling new members at the opening of each school year.

This miniature school republic has two departments, executive and judicial. The executive includes a president, vice president, secretary and commissioner of elections, all elected by popular vote at the regular semi-annual elections, with all the formality and balloting machinery of an adult election. As no pupil having a low grade in deportment is eligible to run for any office, it is easy to see how the ambition to hold office, which runs riot throughout the school, may become a more effective chastener of conduct than the old-time birch rod.

The executive department has charge of the league's monthly meetings and, through the president, appoints about a dozen committees to carry on a host of school activities. Most important among these are a girls' and a boys' athletic committee; a street, yard and alley committee to see that the streets and alleys around the schoolhouse are kept clean; an entertainment committee to provide suitable programs for all sessions of the Law and Order League; and a fire commissioner, who conducts all fire drills, tests the fire apparatus and makes monthly reports to the board of education.

The biggest results in league work, however, are achieved by the judicial department, whose courts are the remarkable fruit of a suggestion made by a chronically erring urchin. Sent to the principal's office for the 'steenth time by an exasperated teacher, the boy thus plaintively unburdened himself to Mr. Lewis: "What's the use? People don't see things the way a feller sees 'em. Teachers don't. If us kids could get together we could make each other behave!" Now the secret of Professor Lewis's success is in no small degree due to his readiness to adopt a good idea, no matter if it emanates from the humblest pupil. In a flash, he caught the youngster's point of view, namely, that the young folk felt they understood each other better than any adult could understand them and so were better qualified to judge each other.

. Two courts, a boys' and a girls', were at once organized for the whole school, with separate, smaller courts for each room, thus forming a judiciary system that not only revolutionized the school but transformed the young sinner who suggested it into one of the school's staunchest upholders of law and order. Each court has its own officers, consisting of judge, clerk, sheriff, and the defending and prosecuting attorneys, chosen by popular ballot at the regular elections.

Each court has its own jury, selected by lot, with every child in the school liable to jury service. Do they like it? They love it! The overwhelming majority of these young citizens wouldn't for anything dodge a chance to sit in judgment on their mates. Once Professor Lewis had grasped this important bit of psychology, he hadn't the slightest difficulty in mobilizing public opinion against wrongdoers in the Raymond School. No jury, however, is permitted to serve for longer than two weeks in succession, thus making it practically impossible for any clique to get control of the jury and mete out private vengeance instead of justice.

The grand jury, that is, the big school court, meets in the school assembly hall regularly every Tuesday morning, first the boys' court and then the girls' court holding an hour's session. These sessions, which are carried on without the presence of teachers or principal, are stern business affairs, attended only by the officers, the jury, the witnesses and the accused, who are brought in by the sheriff as each case is called. The grand jury has jurisdiction over offences committed on the playground and in the basement and the corridors, such as fighting, profanity and riotous disorder.

The room courts, which meet at least once a week and, in emergencies oftener, handle smaller offences confined to the limits of the various rooms, such as being repeatedly tardy, misbehaving in line, petty thieving and cheating. One teacher reports that the room court in her grade practically stamped out cheating, by making life a burden to the persistent cheaters.

In order that too severe a strain may not be put on the juvenile sense of justice, the sentencing of the guilty is left to all the court officers, instead of to the judge alone. The punishments meted out by the courts are unique and rarely ineffective. One of the most humiliating sentences is that the guilty one shall be put in charge of his teacher, following her wherever she goes and never once getting out of her sight. Another sentence that wrings the withers of the guilty is to be referred to Professor Lewis—the last word in punishment. Rioters in the halls or on the stairs are frequently sentenced to spend a dozen or so recesses marching up and down the stairs from top floor to basement in charge of the sheriff. Sometimes an entire room falls into disgrace and is punished by its own court by being voted out of the Law and Order League for a period, as when one of the upper grade courts voted the grade out of the league for a week on account of some loud talking in its cloakroom. On another occasion, the directorate, a body composed of all the league officials, the judges of the courts, the chairmen of the various committees, and the presidents of all the room leagues, suspended another entire room from the league for a month and condemned it to take its recesses alone because it had been persistently disorderly in marching up and down stairs. Such suspensions automatically deprive all pupils in the guilty room from serving on juries or discharging the duties of any offices they may hold during the period of the sentence—a heavy punishment. Another time, some new pupils from the South helped themselves to some sweets from a peddler's cart just outside the school grounds—an outlawed offence at Raymond School, where peddlers' carts have long been immune from pilfering. The grand jury caught every culprit and scared them half out of their wits by imposing heavy sentences.

"Most of the disorder which the league now has to handle," explained Professor Lewis, "arises from our having to absorb large numbers of colored children migrating from the South. They misunderstand our system, mistaking self-government for license; so they proceed to 'start something' and the first thing they know they are jerked up before the grand jury or the room jury and sentenced, after being given to understand that they have disgraced the school by their conduct. Under the pressure of an adverse public opinion, the great majority of them soon become good citizens."

Of course, there are a few extreme offences that the courts do not attempt to handle, turning the few incorrigibles over to the teachers or Professor Lewis.

The question at once arises, does justice ever miscarry in the league courts? A few instances are on record, to the great chagrin of the pupils, who are consoled, however, upon learning that the proportion is insignificant when compared to miscarriages of justice in adult courts of law. The league has the recall to aid it in weeding out injustice and inefficiency, the chief requirement being a petition of 25 per cent of the vote cast at the previous election. The directorate receives the petition and orders the election commissioner to call a special election. Only last spring, the clerk of the boys' court (grand jury) was recalled by a large vote because he played favorites, neglecting to call certain cases of offenders who were his friends. Shortly after this election, a petition was started to recall the sheriff of the boys' court, who had permitted his deputy to kick a member of the jury during the solemnities of a court session and in the presence of a visitor. Why hadn't the sheriff at once "fired" his deputy, who had acted thus in contempt of court? (Any willful disorder in the courtroom is "contempt of court" and is severely punished.) The boys were disgusted by the weakness of their sheriff and demanded an official with some backbone!

The court system has been especially successful in eliminating tattling. Instead of being carried to the teachers or Professor Lewis, all complaints against offenders are lodged with the clerk of the particular court that has jurisdiction in the matter and this official notifies the accused and the witnesses. The innocent have learned not to fear trial, because of the pains taken to sift the evidence. Though any pupil may make the charge, the room courts require the testimony of at least two witnesses to prove it. If only one witness is available, it must be a pupil with a reputation for truthfulness to secure conviction. And somehow, the injustice of false arrest by the accused's mates doesn't rankle after acquittal as does a false accusation made, all in good faith, by a teacher or a principal!

What do the teachers think of the league? When Professor Lewis first founded it, most of them agreed with the rest of the world that he was a mild sort of lunatic. Today they are practically unanimous in pronouncing the Raymond School the nearest earthly approach to a teachers' paradise. For twelve years they have not had to patrol the halls or supervise the basement and playgrounds or keep an argus eye on the behavior of their broods in the assembly hall. If a teacher is called out of her room, the room league keeps faithful guard.

As for the parents, they stand solidly behind the league, while many parents from other districts are so eager to have their children attend the Raymond School that they sometimes tell "yarns" claiming residence in the district so that the school authorities will admit their children. And many a poor colored mother has gladly gone out to work by the day so that her older children will not have to leave Raymond and go to work before completing the eighth grade.

BOYS' GRAND JURY—Raymond School.

Thanks to the high degree of justice in Professor Lewis's system, the school has no race problem, for the colored pupils, though greatly in the majority, never draw the color line.

Professor Lewis does not particularly emphasize the facts that the school corridors and basement are no longer defaced by scrawlings, that no cigaret has been smoked on the school premises in seven years, and that fighting is severely under the ban of the league. The result which he finds supremely important is that the Raymond pupils are putting into daily practice lessons in running the machinery of government, such as voting, officeholding and jury service, which should add greatly to their efficiency as citizens. Better yet, the school, living in an atmosphere of responsible self-government, has learned to like law and order and to prefer it to disorder.

Ontario's Farmer-Labor Premier a Fighter

Year's Administration of Canadian Province by Drury Cabinet Ends With Government of Class Coalition Stronger Than at Its Inception

JUST a year ago there came into power in the Province of Ontario, as a result of a political revolution which smashed both the old parties, a Farmer-Labor Government. All its members were new in politics. Not one of them had ever held political office before and only one had served in a legislature. One was a broom maker by trade, another was a locomotive engineer who, as he laughingly explains, literally stepped from a cab to a cabinet; the others, with the exception of a lawyer retained to act as attorney-general, were practical farmers, the kind who toil in the fields from daybreak to dark and milk the cows and do the other chores by lantern light.

Nearly everyone said such a government couldn't last. It was in the first place an unnatural coalition between farmer and trades unionist. In the legislature this coalition at best by counting everybody at all sympathetic could not depend on a majority of more than one or two. The ministers' lack of experience would lead them into traps and even if luck saved them from disaster from this cause, the supposedly fire-eating radicalism and class consciousness of the movement would be certain to assert itself so strongly that the community would be shocked and rise up to remove, forcibly if necessary, the offenders. Most prophets said the administration wouldn't last the first session. Others gave it a year.

Well, the year is over. The government has not collapsed. On the contrary, it is no exaggeration to say that with one possible exception it is at this moment stronger with the people as a whole than any government the province has had in a generation. This Farmer-Labor cabinet has avoided the class appeal. Its leader again and again has emphasized his desire to make his government a people's government and for the present he seems to be succeeding. But other politicians have announced their love of all the people and traded on the classic phrase of government of the people, for the people, by the people. And one must look elsewhere than in words for an explanation of the strength this Farmer-Labor coalition has achieved.

The government has developed strength not by expected radicalism which has not been in evidence, not chiefly by its progressiveness, which has been moderately in evidence, but by its courage. Already on a number of occasions it has shown backbone to a degree that, having in mind the supineness of most governments in the face of popular clamor and powerful interests, has been quite surprising and refreshing.

For example, the hero of Ontario for fifteen years has been Sir Adam Beck, the head of the provincially owned hydro-electric enterprise who after a long and hard-fought battle, humbled the private power monopolists and gave Ontario perhaps the cheapest light and power in the world. Previous governments and the old political parties, it is no overstatement to say, feared the very name of Beck. So decisive was his ascendancy that it only had to be proved against any candidate that he was anti-Beck and his chances of election went glimmering. And Beck, combining with unusual public spirit a certain autocratic turn of mind, used his popular ascendancy to the full, carrying through his policies with a high hand.

Drury Holds Up Sir Adam

WHEN the Drury cabinet came in Beck was in the act of launching as an outgrowth of his power policy a great radial railway scheme. The public didn't know much about it but, as Beck was sponsor, assumed it was all right and that as no one would dare ask questions it presently would be in operation. But it had failed to take into account Ernest Drury, the new Farmer premier, and was dumbfounded one morning to read that Drury had held up the whole radial scheme. Up to this point there had been no one in the province who had dared to question Beck's dictum about anything. But Drury said, "I have to be shown." And at present an exhaustive examination by experts into the whole complicated project is proceeding. A curious feature is that many persons, who were and remain decidedly pro-Beck on general issues, believe that in this particular issue Drury did the right thing. They are accepting Drury's assurance that he has only friendship, not hostility, for Beck's projects. Should there be evidence later of hostility—and there have been sinister rumors—the situation would change in a twinkling.

Meanwhile the incident has made the Farmer premier a hero with big business. Beck to big business personified the rising menace of mobocracy. He was the head and front of the public ownership movement. Many times the big interests thought they had him scotched but were disappointed. He fought them with their own weapons and with their own ruthlessness. With the public, regardless of party, a unit behind him, the outlook for them was hopeless. No maiden in distress was ever more overjoyed or more surprised at the figure of the rescuing knight than were the big interests when they found that it was the radical premier from the farm who first had courage to stand up to their oppressor. An Englishman might as well challenge the Crown and the Church of England and the authority of Parliament and an American might as well question the virtue of the Declaration of Independence as for an Ontario politician to question the Beck policies. But Drury has done that thing and so far has not been struck dead by the lightning bolt.

In the legislature itself Drury quickly was called on to show his mettle. Remember on a strictly party division he might count on a majority of one, or thereabouts. Doubtless with this in mind some enterprising member started a round robin to increase the members' sessional indemnity. In a day or two nearly all the members of all the parties had signed it. High cost of living made the case plausible and if everyone was unanimous, who would criticize? Then the premier who had on assuming office cut his own salary by several thousand dollars a year heard of the round robin. He immediately made a public announcement to the following effect:

"I do not believe this to be an opportune time to increase public expenses and there will be no increase in the members' indemnity." The round robin died right there. There wasn't a single insurgent to threaten the premier with his political life.

Will Compromise—on Unessentials

DRURY followed this defiance of his following in the legislature with a defiance of the political machine of his party—no less. For the Farmers' party has—perhaps more properly is—a political machine. The United Farmers of Ontario, commonly known as the U. F. O., based on solid commercial benefits, has unique cohesive advantages, particularly when there is at the head of it an aggressive and able executive, Mr. J. J. Morrison. Now Drury in a peculiar sense is beholden to the organization for his position; for while he in association with Morrison was active in the U. F. O. from the beginning, he was not a foremost leader in

ERNEST DRURY, Premier of Ontario

the political campaign which resulted in the U. F. O. victory. He was not even a candidate in the election and he was brought in as leader only after the battle had been fought and won.

It was not long until he showed a disposition to break loose from the U. F. O. executive. And on a definite issue, not in itself important, came a test of strength. Drury found the civil service suffering from lack of a superannuation and pension scheme. So he formulated a modest system providing for the retirement of aged state servants on pensions running up as high as $1,500 or $2,000 in the case of those of the greatest age and service. Morrison openly opposed the scheme and denounced it as setting up a privileged class. Many thought the end of the administration was at hand. But Drury didn't blink an eyelash. "We believe this act to be a matter of simple justice to faithful servants and we are going on with it," he said. The U. F. O. rebellion died and the scheme is now law.

Again he took his life in his hands with Labor, the other wing of his coalition, and on Labor's pet issue, the eight-hour day. It came up on a large government work employing several thousand men. The government didn't receive the full force of the assault, for a commission intervened but the ultimate responsibility of the government was apparent to all and it didn't hedge. There was a strike. Drury insisted that if the state's interests were to be safeguarded there must be maximum production and capital expenditures must be kept down. The strike petered out and the men are working more than eight hours.

It would be a mistake if it were assumed from the foregoing that this Farmer premier is a swashbuckler breathing defiance to all and sundry. Nothing could be further from the truth. In no instance has Drury permitted the issue to become a contest of personal strength. Rather he kept himself in the background and discovered the art of putting forward the issue as a stone wall barricade against his opponents. When they came up against that wall they appreciated the hopelessness of their cause but without resentment.

Nor must it be supposed that Drury is always unyielding. On unessentials he can compromise as quickly as anyone and his way through his first session of the legislature was notably expedited by his uniform good temper, spirit of conciliation, and disposition to make concessions necessary to reach common ground.

But to have stood firm before the challenges of his personal following in the legislature, of his political party, of organized labor, of the most powerful non-political movement in the province is a unique record for one year. And it is not surprising that for sheer courage he has won much respect. And he has displayed more than courage. Despite inexperience, despite his precarious tenure which with many politicians would have been fatal he has displayed an almost uncanny surefootedness, and has yet to make a cardinal error.

And what has been the year's record of the Farmer-Labor Government in matters of legislation and administration? As already intimated there has been little radicalism. But the year has been unusually active in legislation. This may have been due to the fact that the members were nearly all new. In addition Drury, making a virtue of the group system which has replaced the bi-party division of the house, sought and obtained the co-operation of all groups in the initiation and perfection of legislation.

The Labor group made its presence known through three advanced pieces of social legislation, a mothers' allowance act providing for pensions for widows with children, a minimum wage act to be applicable to all female employes except domestic servants and farm laborers and an amendment to the already excellent Workmen's Compensation Act increasing the scale of payments from 55 to 66 2-3 per cent of the workman's previous earnings. Labor men were disappointed at the scale of payment provided in each of these instances, the Farmer ministers being conservative in such matters, but on the whole were well satisfied to have the principles established. The mothers' allowances are now in operation under a central board, with district representatives.

Constructive Legislation Adopted

THE only piece of legislation against which could be made any allegation of a class appeal to the Farmers was an act launching an extensive scheme of highway improvement, but with motor transportation looming so large, the cities as well as the farmers were gratified by it.

To increase revenue the government had recourse to a doubling of the taxes raised by death duties, a point of some significance as showing a community of interest between the supposedly conflicting viewpoints of Laborites and Farmers on a vital matter of public policy. This cabinet also picked up a million dollars by imposing a tax of $7,500 a day on every race track.

Altogether more than 250 bills were considered by the new legislators in their first year. Among these passed was one designed to purify elections, one to implement the effectiveness of prohibitory liquor legislation, one to extend the provincial government railway to James Bay, one to assist local co-operative marketing associations, one to appoint a minister of mines, and others covering the widest range of activities. While not spectacular it is a record of usefulness rarely achieved by any of the former party governments.

In administration, the watchwords of the Farmer-Labor coalition are economy and honesty. Its economy provides another reason for the growing respect of the business community. In the lands and forests department, these unsophisticated men from the farm and the workshop have unearthed a sore that has been festering for a generation. Great areas of timber limits, it has been found, have not been yielding the dues to the province that the law requires, and the government after investigation is selling out to recover sums of money estimated in the millions. This also required courage, for up till recent years the chief private fortunes of the province had their basis in the lumber trade and it has been said that the lumbermen have made or unmade more than one Ontario government.

If Honorable E. C. Drury continues as in his first year he may remain premier of Ontario for an indefinite period. But already there are rumors that he may be before long translated to the federal arena. In that field the time is ripe for progressive forces to attain power. But as long as those forces remain divided as they are, there is a prospect that the present government, weak though it is acknowledged to be, will remain. Neither Mr. Crerar, the western Farmer leader, nor Mr. King, the Liberal leader, seems to have the capacity to secure co-operation and cohesion between the opposition groups. It has been suggested that Mr. Drury is showing the qualities that would fit him for the task. If he receives the call and is successful he will be the next premier of Canada.

"D'Israeli of America"—A Jew of Super-Power

Do You Know Anything About "Barney" Baruch? He Was the Real American Power From Plattsburg to Versailles

ALTHOUGH the war had the effect of decreasing Jewish power in Wall Street by temporarily hindering, but perhaps not altogether breaking off, the communication between Jewish financial houses in the United States and their associates overseas, it also had the effect of greatly increasing Jewish wealth in this country. It is stated upon the authority of a well-informed Jewish source that in New York City alone fully 73 per cent of the "war millionaires" are Jews.

The mistake should not be made of assuming that because of the temporary setback in Wall Street, the war meant a total setback for the Jewish program. It did not. Jewry emerged from the war more strongly entrenched in power, even in the United States, than it was before. And in the world at large the ascendency of the Jew, even where he was in control before, is very marked.

A Jew is now President of the League of Nations.

A Zionist is President of the Council of the League of Nations.

A Jew is President of France.

A Jew was President of the committee to investigate the responsibility for the war, and one incident of his service was the disappearance of vital documents.

In France, Germany and England, the financial power of the Jews, as well as the filtration of their dangerous ideas of social disorder, have greatly increased.

It is a most remarkable fact that in those countries which can justly be called anti-Semitic, the rule of the Jew is stronger than anywhere else. The more they are opposed, the more they show their power. Germany is today an anti-Semitic nation. Yet, in spite of all that the German people have done to rid themselves of the visible show of Jewish power, it has entrenched itself more firmly than before, above and beyond the reach of the German popular will. France becomes increasingly anti-Semitic, and as the anti-Jewish wave rises, a Jewish President appears. Russia itself is anti-Semitic to the core, and the Jew is Russia's new tyrant. And at a moment when, as all Jewish spokesmen inform us, there is a world wave of anti-Semitism—which is their name for a new awakening of the nations to what has been going on—what should occur but that at the head of the League of Nations, in a position which but for the absence of the United States would constitute the Chief Magistracy of the World, a Jew appears. Nobody seems to know why. Nobody can explain it. Neither previous fitness nor public demand pointed him out—yet there he is!

"The D'Israeli of the United States"

IN OUR own country we have just had a four-year term of Jewish rule, almost as absolute as that which exists in Russia. This appears to be a very strong statement, but it is somewhat milder than the facts warrant. And the facts themselves are not of hearsay origin, nor the product of a biased point of view; they are the fruits of an inquiry by the lawful officials of the United States who were set aside in favor of a ready-made Jewish Government, and they are forever spread upon the official records of the United States.

The Jews have proved for all time that the control of Wall Street is not necessary to the control of the American people, and the person by whom they proved this was a Wall Street Jew.

This man has been called "the pro-consul of Judah in America."

It is said that once, referring to himself, he exclaimed: "Behold the D'Israeli of the United States!"

To a select committee of the Congress of the United States he said:

"I probably had more power than perhaps any other man did in the war; doubtless that is true."

And in saying so he did not overstate the case. He *did* have more power. It was not all legal power, this much he admitted. It reached into every home and store and factory and bank and railway and mine. It touched armies and governments. It touched the recruiting boards. It made and unmade men without a word. It was power without responsibility and without limit. It was such a power as compelled the Gentile population to lay bare every secret before this man and his Jewish associates, giving them a knowledge and an advantage that billions of gold could not buy.

Doubtless not one in every 50,000 of the readers of this paper ever heard of this man before 1917, and doubtless the same number have clear knowledge of him now. He glided out of a certain obscurity unlighted by public service of fame, into the high rulership of the nation at war. The constituted government had little to do with him save vote the money and do his bidding. He said that men could have appealed over his head to the President of the United States but, knowing the situation, men never did.

Who is this figure, colossal in his way, and most instructive of the readiness of Judah to take the rule whenever he desires?

His name is Bernard M. Baruch. He was born in South Carolina 50 years ago, the son of Dr. Simon Baruch, who was a medical man of some consequence. "I went to college with the idea of becoming a doctor, but I did not become a doctor," he told the Congressional Committee. He was graduated at the College of the City of New York when he was just under 19 years of age. This college is one of the favorite educational institutions with the Jews, its president being Dr. S. E. Mezes, a brother-in-law of Colonel E. M. House, the colonel whose influence and disfavor at the White House has for a long time been a favorite subject of wondering speculation on the part of the American people, though it scarcely need be so any longer.

His Wall Street Apprenticeship

APPARENTLY young Baruch knew exactly what he wanted to do, and set out to do it. He says he spent "many years" after his graduation in certain studies, "particularly economics" as related to railroads and industrial propositions. "I tried to make Poor's Manual and the financial supplement of the Financial Chronicle my bible for a number of years."

He could not have spent very "many years" in these pursuits, for after going down to Wall Street as a clerk and a runner, and when he was "about 26 or 27" he became a member of the firm of A. A. Housman & Company. "In about 1900 or 1902" he left the firm, but he had meanwhile gained a seat on the Stock Exchange.

He then went into business for himself, a statement which must be taken literally in view of his testimony that he "did not do any business for anybody but myself. I made a study of the corporations engaged in the production and manufacture of different things, and a study of the men engaged in them."

In answer to questions intended to disclose the exact nature of his operations before he suddenly appeared as the man who "had *more power than perhaps any other man did in the war,*" he stood off from any intimations that he perhaps engaged in mere buying and selling of stock. "My business then became the organization of various enterprises," he said, "and in connection with that, I, of course, did buy and sell stocks .... If I organized any concern, I naturally took a large interest in it, or I would not organize it if I did not believe in it, and I stayed with the development of that concern; and then if I cared later on to sell it, I would sell it."

Pressed by the examiners for a still more detailed account of his activities in business, he said:

"Well, I was instrumental in the purchase of the Liggett & Myers Tobacco Company; in the purchase of Selby Smelter, Tacoma Smelter, and various copper, tungsten, rubber—I was instrumental in building up one of the great industries in rubber in Mexico, which was the establishment of the source of supply of rubber, and developed a large concern there for the production of raw material, which is still going on ....

"I became interested in the new process of concentration of low-grade ores in the Mesaba Range, but the interest I had particularly in steel was in the study of the present-day organization, in order to get myself posted so that I could intelligently buy or sell their securities ...."

A Matter Still Needing Light

IT IS an important point, one not made very clear in the testimony, what interests Mr. Baruch held at the beginning of the war. His previous activities in various fields, principally perhaps the field of metals, had been important and numerous. In any case, as a young man, he is found to be master of large sums of money, and there is no indication that he inherited it. He is very wealthy. What change the war made in his wealth, if it made any change at all, is a matter on which nothing may be said now. Certainly many of his friends and closest associates reaped great quantities of money from their activities during the war.

Now, as to the point of his business connections just prior to the war, this testimony appears:

> Mr. Graham—"You continued in the operation of these various businesses, in the formation of companies and the flotation of their stocks, and in your business in the Stock Exchange and elsewhere *up until the time of the beginning of the war?"*
>
> Mr. Baruch—"I was gradually getting myself away from business, because I had made up my mind to retire, and I had been getting less active with that end in view, and I was not very much in sympathy with the organization of companies. I am not criticising other men who engage in business that resulted in profits even before we had gotten into war. *I had made up my mind to leave* and do some other things that I hope to be able to do now; *but that process was interrupted by my appointment as member of the advisory commission* without any suggestion or without any knowledge or idea it was coming."

Does he mean that the process of getting out of business was interrupted by his appointment on the advisory commission, which appointment led straight to his complete rulership of the United States at war?

> Mr. Jefferis—"Had any of the members of the advisory commission been engaged in the production of raw materials or in manufactured products, or not?"
>
> Mr. Baruch—"I had."
>
> Mr. Jefferis—"In what way?"
>
> Mr. Baruch—"I had made a rather deep study of the production and the distribution and manufacture of many of these raw materials. I had to make an intensive study of these things in order to do the things I was engaged in."
>
> Mr. Jefferis—"You were not running any raw material production?"
>
> Mr. Baruch—*"I was interested in concerns—* I was interested in the study and production of a great many of these things, because I developed and organized concerns which did it."

Does he mean that he was interested in concerns at the time of his appointment? This would be an interesting point to clear up.

How Did He Meet Woodrow Wilson?

ANOTHER matter which would be not only of interest, but of great usefulness in explaining the gathering of a Jewish government around the President during the war, is the question of Bernard M. Baruch's acquaintance with Woodrow Wilson. When did it begin? What circumstances or what persons brought them together? There are stories, of course, and one of them may be true, but the story ought not to be told unless accompanied by the fullest confirmation. Why should it occur that a Jew should be the one man ready and selected for a position of greatest power during the war?

Mr. Baruch, in his testimony, sheds no light on this question. He had opportunity to do so, had he wished.

> Mr. Graham—"I assume that you were personally acquainted with the President prior to the outbreak of the war?"
>
> Mr. Baruch—"Yes, sir."
>
> Mr. Graham—"Up to the time that you were appointed as a member of the advisory commission, had you ever had any personal conferences with the President about these matters?"
>
> Mr. Baruch—"Yes, sir."
>
> Mr. Graham—"Had he called you in consultation or had he talked to you about these matters and about the matter of your appointment before you were appointed?"
>
> Mr. Baruch—"Never suggested anything about the appointment, because I would have told him that I would prefer not to be appointed."
>
> Mr. Graham—"Do you now recall, Mr. Baruch, how long before you were actually appointed as a member of that advisory commission you had your last conference with the President?"
>
> Mr. Baruch—"No ...."

That is not all of Mr. Baruch's answer, but it is his reply to the question. Having said "No," Mr. Baruch became very communicative on another matter. His complete reply is—

"No; but I can tell you something that may be of interest, and that is probably what you want to know. I had been very much disturbed by the unprepared condition of this country, so much so that I was one of the first men to support General Wood in the Plattsburg encampment, and I think he will admit I gave him the first money and told him whatever he did I would guarantee to stand behind that movement, which happily only took a few thousand dollars so far as I was concerned, having caught the public approval and it went ahead, and in that relation naturally one had to

think about the mobilization of the industries of the country, because people do not fight alone with their hands; they have got to fight with things."

It is thus shown that Mr. Baruch was a forehanded gentleman. It was only the year 1915. The European war had then not become more than an amazing spectacle to the mass of the American people. But still Mr. Baruch was convinced we were going to have war, and he spent money on his guess. The government which was then "keeping us out of war" was also consulting with Mr. Baruch who was already ahead of the government in creating the atmosphere of war in this country. If the reader, by a mental effort, can reconstruct the year of 1915, and then put into his picture of that year the element of which he was not then possessed, namely, the activity of Mr. Bernard M. Baruch and other Jews, he will see that he did not know much about what was going on, even if he did read the newspapers with attention!

"I Thought a War Was Coming Long Before"

TO PROCEED with the examination, following the place where Mr. Baruch made his interesting disclosure of his part in the Plattsburg experiment:

> Mr. Graham—"That was about 1915, was it not?"
>
> Mr. Baruch—"Yes, 1915; and I had been thinking about it very seriously, and I thought we would be drawn into the war. I went off on a long trip, and it was while on this trip that I felt there ought to be some mobilization of the industries, and I was thinking about the scheme that practically was put into effect and was working when I was chairman of the board. When I came back from that trip I asked for an interview with the President. It was the first time I had seen the President since his election, so far as I can remember now."
>
> Mr. Graham—"You mean his first election?"
>
> Mr. Baruch—"His first election, yes."

So it is probable that Mr. Baruch, if any stress may be placed on the manner of his words, had known the President before. Ordinary men, who meet the President seldom, usually have a very clear recollection of those meetings. The fact probably is that Mr. Baruch saw the President so frequently that he found it difficult to distinguish the meetings in his memory. He describes the visit referred to:

"I explained to him as earnestly as I could that I was very deeply concerned about the necessity of the mobilization of the industries of the country. The President listened very attentively and graciously, as he always does . . . . and the next thing I heard—some months afterward . . . . my attention was brought to this Council of National Defense. Secretary Baker brought it to my attention. This was the first time I had met the Secretary of War. He asked me what I thought of it."

Mr. Graham—"That was before the bill was passed; before it became a law?"

Mr. Baruch—"I think it was. I am not certain about that. *I said I would like to have something different.*"

This is rather important. A Council is a *council.* Mr. Baruch wanted *something different.* Eventually he did get something different. He got the President so to change matters as to make Mr. Baruch the most powerful man in the war. The Council of National Defense eventually became the merest side show. It was not a Council of Americans that ran the war, it was an autocracy headed by a Jew, with Jews at every strategic point down the line. What Mr. Baruch did was very masterly, but it was not in the American manner. He did what he set out to do, but it is seriously to be questioned whether any man ought to have done what he did, and probably no one but a member of his race would have wanted to do it.

Mr. Graham—"Did the President express any opinion about the advisability of adopting the scheme you proposed?"

Mr. Baruch—"I think *I did most of the talking.* I do not remember what the President said on that subject, but I think it can be best seen as expressed in the bill."

Mr. Graham—"Did you impress him with your belief that we were going to get into the war?"

Mr. Baruch—"I probably did. I would like to tell you exactly, but I do not want to guess at it."

Mr. Graham—"That was your opinion at the time?"

Mr. Baruch—"Yes; I thought we were going to get into the war. *I thought a war was coming long before it did.*"

The examination then reverted to Mr. Baruch's conference with the Secretary of War, in which the former had said he "would like to have something different."

Mr. Graham—"Mr. Baker said he thought that was the best that could be gotten at that time?"

Mr. Baruch—"I got that impression. Whether he said so or not, I do not know, but I got that impression that that was the best that could be gotten at that time."

If the event had not turned out exactly as Mr. Baruch planned it, a great deal of his testimony might be discounted on the principle of the natural boastfulness of the Jew after a scheme has succeeded; but there is no discounting anything that he says. The President did exactly what Baruch wanted in a thousand matters, and what Baruch apparently wanted most of all was a ruling hand upon productive America. And that he got. He got it in a larger measure than even Lenin ever got Russia; for here in the United States the people saw nothing but the patriotic element; they did not see the Jewish Government looming above them. Yet it was there.

Was It Brains Alone—Or?

THE ouncil of National Defense, as originally constituted—"the best that could be gotten at that time." though Mr. Baruch "would like something different"—was headed by six secretaries of the Cabinet, the secretaries of War Navy, Interior, Agriculture, Commerce and Labor. Beneath this official group was an advisory commission, of seven men, three of whom were Jews; one of these Jews was Mr. Baruch. Beneath this advisory commission were scores and hundreds of men, and many committees. One of the groups subordinate to the two groups just mentioned was the War Industries Board, of which Mr. Baruch was originally merely a member, Daniel Willard being the chairman.

Now, it was this War Industries Board which became the "whole thing" later on, and it was Mr. Baruch who became the "whole thing" in that board. The place where he was put became the cornerstone; he became the chief pillar of the war administration. The records show it; he himself admits it.

What influence reached into this Council of hundreds of Americans and chose a single Jew to be their undoubted lord and master for the duration of the war? Was it Baruch's brains that elevated him? Or was it the suggestion of Jewish finance already well forward in its work of mobilization?

There is no desire to minimize the Baruch brain. Brains and money are the Jews' two greatest weapons. No Jew is picked for a key place who has not brains. Baruch has brains. He is a ceaseless wonder among men who know him. He can do six things at once and control the most colossal operations without fuss or fever. He has both brains and money.

But there is something for Jewry to learn: brains and money are not enough. There is another element which even brains cannot cope with, and which renders money cheap. The chess-playing expert may mystify and compel admiration; but the chess-player does not rule the world.

So, Baruch did things. But Trotsky also has done things. The point is this: Are people to be carried away by an appeal deliberately made to their imagination, or are they to scrutinize what has been done, and weigh its consequences?

Ruled From Washington to Palestine

THE Jews could do greater things in the United States than even Baruch has done, if the opportunity offered, acts of superb ease and mastery—but what would it signify? The ideal of a dictator of the United States has never been absent from the group in which Baruch is found—witness the work, "Philip Dru, Administrator," commonly attributed to Colonel E. M. House, and never denied by him.

As a matter of fact, Baruch could probably do a better job than Trotsky did. Certainly, the recent experience which he had in governing the country during the war was a very valuable education in the art of autocracy. Not that it is by any means Mr. Baruch's possession alone; it is also the possession of scores of Jewish leaders who flitted about from department to department, from field to field, receiving a post-graduate course in the art of autocracy, not to mention other things.

Before Mr. Bernard M. Baruch got through, he was the head and center of a system of control such as the United States Government itself never possessed and never will possess until it changes its character as a free government.

> Mr. Jefferis—"In other words, *you determined what anybody could have?"*
>
> Mr. Baruch—"Exactly; there is no question about that. I assumed that responsibility, sir, and *that final determination rested within me."*
>
> Mr. Jefferis—"What?"
>
> Mr. Baruch—"That final determination, as the President said, rested within me; *the determination of whether the Army or Navy should have it rested with me; the determination of whether the Railroad Administration could have it, or the Allies, or whether General Allenby should have locomotives, or whether they should be used in Russia, or used in France."*
>
> Mr. Jefferis—*"You had considerable power?"*
>
> Mr. Baruch—*"Indeed I did, sir . . . ."*
>
> Mr. Jefferis—"And all those different lines, really, ultimately, centered in you, so far as power was concerned?"
>
> Mr. Baruch—"Yes, sir, it did. *I probably had more power than perhaps any other man did in the war; doubtless that is true."*

What preceded Mr. Baruch's attainment of this power, how far his power reached and how it was used, will be our next inquiry.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

A Jew is now President of the League of Nations. Two weeks after the American elections, this which many feared actually came to pass. Paul Hymans, of Belgium, was the man chosen. Thus "the Jew league" is complete. The only question is, whether the Jews exhibited their accustomed astuteness in permitting this thing to occur so soon. It is only in the hour of victory that the Jew's shrewdness seems to desert him. With Leon Bourgeois, an ardent Zionist, president of the League Assembly, the control would seem to be complete. The only Jew who sat in with the Big Four in the Peace Conference is also an officer of the League. The wisdom of the United States in staying out of the League may now be more apparent to some people than it was before.

"The Red Shield (Rothschild) and the Red Flag (Communism) are two emblems of one and the same thing."

Albert D. Lasker, whose name has recently been given to a new plan of baseball organization, is head of the Lord and Thomas Advertising Agency and prominent in the activities of the Chicago Jewish community. He was in charge of publicity for the Republican party during the recent presidential campaign, and has been mentioned as a possible member of the next cabinet.

Great excitement is reported to have prevailed in the Jewish community at Warsaw because Rabbi Perlmutter gave his nationality as Polish instead of Jewish.

England, which is so constantly referred to by the Jews as their best friend, admitted only 590 aliens during August.

A growing practice of the Jewish press seems to be the writing of letters to prominent men giving a version of THE DEARBORN INDEPENDENT'S articles, and asking written opinions concerning it. To prevent the possibility of mistake, it would not be more than fair if the articles themselves were studied, instead of a biased report being accepted.

Eleanor, the daughter of Mr. and Mrs. S. M. Guggenheim, of New York, is reported to be engaged to Viscount Stuart, M. C., son and heir of the Earl and Countess, of Castlestewart, of Stuart Hall, County Tyrone, Ireland.

The immigrant flood is being felt in Montreal also, where, as the Canadian *Jewish Chronicle* says, "The problem of feeding and housing them is growing ever more acute." The Jewish people coming to Canada today, says this paper, "belong to a superior class. They are clean and intelligent looking, and they seem to be well-developed, mentally as well as physically."

Describing the rush to America by Jews in Poland, Arthur Ruhl, the well-known correspondent writes: "It may appear to be moving slowly, but as a matter of fact, in comparison with the emigrants of the near-by countries, who have to wait months, often, even to have their applications acted upon, these Polish applicants are particularly favored. They fill out their papers one day, and, as a rule, get their passports the next. At the rate they are being hurried through, indeed, some 250,000 Polish Jews will have gone to America in the next year from Warsaw alone." Everywhere else Mr. Ruhl traveled he found the utmost difficulty put in the way of people wishing to come to America, which leads him to say that "the phenomenon in Warsaw and Danzig seems to call for explanation."

The author of the Jewish editorial quoted last week, in which the expression occurred: "Every copy of the New Testament is breeding anti-Semitism," was Rabbi Rudolph I. Coffee, of Toledo. The New Testament is thus classified with "The Merchant of Venice" as an undesirable book. The next logical step would be to insist that it be barred from public libraries.

The immigration restrictions which the Jews themselves have placed upon Jews desiring to enter Palestine are so stringent that none of the Jews now being brought to the United States could possibly be admitted to Palestine.

The London public has just noticed that the customary cross has been omitted from the Cenotaph in Whitehall. The designer was Sir A. Mond, a Jew.

German Food Situation Has Improved Little

By JOHN A. MURPHY

Berlin, October—(By Mail).

GERMANY is slowly recovering its breath for the peace struggle. This struggle is already begun in the home. For those who bore with and survived the self-denials and semi-starvation of 1916-1917, the present comparative plenty is a wonderful change, yet even now food and fuel are so scarce as to be pinching at times. With the exception of a few localities meat is tantalizingly scarce. Meat almost is unknown save for the weekly dole given by the government. The writer had been in Germany four months and outside the cities had eaten (lightly) of beefsteak only twice and not at all of mutton. "American bacon" is procurable at times on the government ration cards but is usually coarse salt pork masquerading as bacon and is for the most part the remnant of military supplies.

Sugar is unknown in many millions of families, as is white bread. Lard is used as butter by those fortunate enough to have it and with chopped apples and onions is a popular substitute for butter.

Many lived through the last winter absolutely without heat in their homes and the outlook for this winter is that thousands will suffer similarly; the best estimate is that 40 per cent of the regular heat will be obtainable. Of course this means 40 per cent of normal heat for those who can afford to buy coal. There are many too poor to buy either food or fuel.

The deprivations the German people are suffering are heightened by the heavy taxes. The workman is taxed 20 per cent of his wages and the housemaids and servants are taxed 10 per cent of their monthly wages, which sum is deducted by the employers and paid to the government. But those who remember the "year of the turnips" contemplate the situation today with satisfaction and I have heard the remark, "This is heaven compared to 1916-17."

The German people are fast becoming vegetarians. They have learned to live with little or no meat, without sugar at all, without white bread and they realize that although not so fat, they are as strong as when permitted to enjoy a meat diet.

The German appetite for beer is gradually lessening; one reason is that the quality of the brew has deteriorated as the demands for grain for food increased. In certain districts, Silesia for instance, prohibition is practically in operation. Many thousands of beer-drinkers are turning to their "coffee" which is drunk in immense quantities although it is often only a substitute for the genuine beverage. This question of the quality of the national drink has been taken up by the government and within the last few weeks the authorities decided to ask the brewers to increase the alcoholic content of their brews. Recent advertisements indicate that such change will be made.

Life for the peasant is drab and dreary. Conditions encourage the farmer to eat the eggs of his poultry. The farmers are organized and through their chosen leaders make frequent demands for privileges or rights unheard of before the coming of the republic, privileges the refusal of which has created discontent and even revolt leading to violence. Owners of farms in some instances have been treated with personal violence at the hands of their angry tenants. There has been a great increase in the wages as well as addition to the perquisites and privileges of the peasants—milk for their families, a greater supply of food from the land that they till, and the limitation of work to the eight-hour day.

The love of the land, the open, is very strong in the German and this is evidenced by the groups of wanderers of young people of both sexes that one meets constantly tramping the country roads and the beautiful forests that are such a feature of German landscape. These groups vary from six to a dozen or more and they camp out at convenient houses arranged along the routes. For the most part they are accompanied by two or more musicians of their set and both instrumental and vocal music echoes among the trees as the "wandering birds" tramp along between stopping places on their journey. The parents of the younger folks are said to approve of these outings and base their approval on the ground of health. Groups of older people, too, are frequently met. All these "hikers" are supplied with knapsacks or *rucksacks,* as they are called here, strapped upon their backs and thus their hands and arms are free to swing a walking stick.

Horses are comparatively few but for the most part are kept in excellent condition. The horses that do the work are not neglected. The lack of cows has been met in many households by the possession of goats and the milk from these economical animals is eagerly sought in both city and country. One sees herds of yearling cattle, giving promise of future increase in dairy products. In the meantime what milk there is in excess of that used on the farms is reserved for infant children and certified invalids.

As the sanitaria are, of course, favored in the distribution of food favors it has come to be suspected that many with fat purses have taken refuge in the sanitaria to get the advantage and benefit of more and better food. Of course this is difficult to prove but the authorities, it must be said, are infinitely patient in all respects as regards the application of the food restrictions and the numerous rules for enforcing them. These observations would be incomplete were not reference made to the other needs. Many children are still without shoes, others possess a sandal-like affair with wooden soles; these are often, apparently, homemade and protect only the sole of the foot. Even those able to buy such shoes as are worn are poorly shod, as worth-while boots and shoes are very expensive. How these will pass the coming winter is a question. Socks and stockings are also hard to find and there are many girls and women with shoes or sandals but without stockings.

More from design probably than otherwise disabled soldiers are not often met in public places; these seem to be cared for in various ways so that the public is spared such reminders of the ravages of war.

What the future has in store for Germany is still "in the lap of the gods." It awaits the solution of the problem of food; of the development of the situation in Russia; of the solution of the crisis that is generally regarded here as imminent in European affairs.

Germany's determination to carry out the terms of the armistice is now being put to the test. She is now engaged in wrecking machinery that cost her many millions and one reads advertisements from the government for bids on offers for sale of motors and other parts of airships, planes, seaplanes, and so on, "in lots of 1,000 to 10,000." Another test is now being made: the demand for the surrender of arms by the people in accordance with the Peace Treaty has been formally made by proclamation and at this writing the reports are favorable to a general compliance with the demands of the government.

Perhaps the most discouraging feature of Germany's present condition is the continued low value of the mark.

Your Own United States

Mauch Chunk, Pa., isn't a mammoth city, but it has "mammoth scenery" all around it, which makes it a place of such beauty that it is much visited. So that tourists can see the city in all its loveliness, the city built a switchback railway, said to have been the first in America, which takes you flying around the corners and up and down hills.

The Crisis for Armenia

NOW that Armenia has reached what looks like her final crisis, wherein is contained the decision whether she shall continue to exist as a separate and independent state, it is interesting to observe exactly what the Armenians have done since they became "free." It is almost the first time, possibly, that anyone has ever written of the Armenians as a state, and *not* as martyrs. This article has positively nothing to say about atrocities and therefore should be worth reading.

Just at present Armenia is facing some angry Turks on one front, some cynical Bolsheviki on another front, some uninterested British on another front and some extremely neutral and fearful Georgians on another front.

The reason the Turks are angry is because a good slice of Armenia was lately Turkey and because they have lost so much elsewhere that they are inclined to recover from the weakest enemy, which is Armenia.

The reason the Bolsheviki are cynical is because they don't believe in nationality, and think the state of Armenia is a thin joke which shortly will evaporate to the wealth and prosperity of those who may happen to be at hand.

The reason the British are uninterested is because British money is in Baku, the famous oil city, which the British selected for the capital of Azerbaijan; and the state of Azerbaijan is so very sick that the British officer in command cannot afford to sit by any other sick bed at all.

And the reason the Georgians are extremely neutral and very fearful is simply because there is no one particularly interested in their progress, although several are mildly interested in their dissolution.

The Armenian Republic was established in May, 1918. The treaty of peace the European Allies later concluded with the Turks gave the Armenians 8,000 square kilometers, including Lake Seven. If you want to get Armenia on the map, look for Mt. Ararat; Mt. Ararat was the center of ancient Armenia and was the landmark where the Russian, Persian and Turkish divisions of Armenia met in 1914.

The 8,000 square kilometers given the Armenians did not comprise the equal in resources of any single state in the American union. It was largely in ruins, and its desolated country had been swept bare of cattle and grain. During two years the Armenians gradually added to this domain, until in May, 1920, it included 52,000 square kilometers and plans were on foot for another 8,000 or 10,000 square kilometers.

And at this point the Turkish Nationalists became interested. It is, however, a fact that ever since they declared their independence two and a half years ago the Armenians have been fighting. A former Armenian president has put it neatly enough: "There are times when guns and rifles go off by themselves." And the Armenian guns went off, simply because the Armenians found themselves surrounded by Turks, Tatars, Kurds, Georgians and a few other excited groups, all having ambitions, more or less defined. So the Armenians fought in May, 1918, and have been fighting since and are fighting yet, the rifles continuing to go off.

They first fought the Georgians, and it was following this (in which they were successful) that the Armenians stepped out a bit in the general direction of the Bosphorus and quietly absorbed the formerly Turkish cities, Kars and Aleksandropol. Here there is fighting now. They fought with the Tatars (always allies of the Turks) to conquer Shusha, an ancient Armenian province possessing extremely rich soil, and occupied it, to the utter and continuous discontent of the Tatar state of Azerbaijan. However, the Tatars know that the Armenians will only be permitted to push them just so far, because of British interests in Baku. Of course Britain fought the Turks and the Tatars. But it's a funny world.

Armenia, however, has made far more progress than is generally realized. Armenia now talks of Armenia Irredenta, just as Italy used to talk of Italy Irredenta when they wanted to recover the Austrian Tyrol. As Italy, as Serbia, as Greece, as Poland, as Lithuania, so now is Armenia, ambitious and eager to restore the full measure of ancient glory. Her government, to date, has been fairly harmonious. She has had three presidents, who succeeded each other as events made it advisable. The first was Johannes Kachatzouni, who gave three sons to the battlefield, and was the outstanding figure of the declaration of independence. Mr. Kachatzouni resigned to come to America to stir up Armenians in the United States. Alexander Khatisian, who coined the happy phrase quoted earlier in this article, succeeded him. Khatisian is a remarkable man; he was mayor of Tiflis when the czar ruled in Russia; Tiflis then was known as the capital of Caucasus, and a very prosperous place. Khatisian has made an enviable record since he led the Armenians astutely through their earliest and darkest hours of liberty. Mr. Khatisian resigned to tour Europe in the interests of the Armenian Republic, and has been succeeded by Dr. Ohanjanian. He was chosen as especially fitted to conclude a treaty with Soviet Russia, which he did; although there are confessed doubts as to how seriously the Bolsheviki regard the agreement. They are still camped on the frontier.

A definite program of reconstruction has been launched, even while fighting continues The outstanding feature of this side of the work is an educational system, which so far includes one university and 758 schools. The chief difficulty seems to be the lack of funds, but as the Armenians plead for a loan chiefly on the ground of army needs there has been some reluctance, in Allied centers, in view of the generally speculative conditions of the Caucasus, to respond. The two ex-presidents are canvassing the Armenian colonies all over the world to raise this loan.

If Armenia is a long way from being a strong and stable state, there are not wanting signs of healthy effort and a sound direction on the part of her leaders. At least, she looms up definitely, when you look close enough, and is actually creating the elements of good government.

This is sufficient to warrant general interest. And, as promised, this is all argued without any reference to atrocities.

(C) Gilliams Service

All England is now talking about Jessie Stephens, a pretty twenty-seven-year-old representative of the working classes, who at present dims in political interest the noted Lady Astor whose election to Parliament caused so much discussion, particularly in this country because of her American birth. Miss Stephens warns men to beware, for she is boldly out and feels confident of being elected to Parliament at the General Election. She is considered one of the best organizers in England, and a fearless and capable speaker. She toiled for years at selling newspapers, as a domestic servant, a grocery clerk, a truck driver and many other menial tasks. At present Miss Stephens is a labor councillor of the borough of Bermondsky.

It Has No Capital, Just a Stamp

THERE is a new republic in Europe; it has no capital—in fact, has no territory at all; it has, therefore, no government, no army, no navy, no police, no taxes, and no citizens to pay them.

It has, however, a postage stamp.

This is the Republic of Alsace-Lorraine. It exists in the persons of a committee of three: Count Rapp, Rene C. Ley and H. Muth.

Messrs. Rapp, Ley and Muth started this business of a republic before the French occupation. So they were forced to cut and run at the armistice. They found a refuge in Switzerland, whence they directed two lengthy appeals to President Wilson, protesting against bestowing Alsace-Lorraine on France, and neither of these he acknowledged. M. Millerand, commissary general for the French Republic in Alsace-Lorraine, heard all about it and Messrs. Rapp, Ley and Muth were indicted, tried (in their absence) and sentenced to deportation for life.

The three republicans then lodged a formal complaint with the secretary-general of the League of Nations, Sir James Eric Drummond, suggesting that the League reverse the decree of the Peace Conference. They then (in July, 1919) placed the whole matter before Gustav Ador, president of the Federated Council of Switzerland. The only report of the result of this conference is by Count Rapp who quotes M. Ador as being extremely sympathetic while regretting very much that Switzerland could not complicate her position in foreign affairs by espousing it. The members of the Swiss foreign department also agreed that it was too bad the Federated Council of Switzerland would have to forego all intervention in so extremely difficult a question.

Stamp is nation's sole claim to recognition.

After flitting from Berne to Basle, and from Basle to Berne, the committee of three landed in Baden-Baden, which has been their headquarters. Here they are printing and distributing broadcast statements of their case; here, also, they designed a very pretty postage stamp which, however, for the present, they put inside their mail, using the ordinary stamps of existing predatory states for the outside.

Now, don't run away with a wrong idea. It is true the committee feels kindly toward Germany; but union with Germany is not their objective. They have good historic ground for their argument, and they have a crowning argument in the fatal weakness of the Versailles Treaty—the failure to provide a plebiscite in Alsace-Lorraine which, almost certainly, would have given the territory to France, and at the same time, would have removed the fluent cry now raised of annexation.

If the republic of three men could have its way it would unite with Switzerland, but the Swiss are too wise to consider or encourage such an ambition. Failing that, they want independence, even if as a French protectorate; with their own ministry, parliament, militia and so forth.

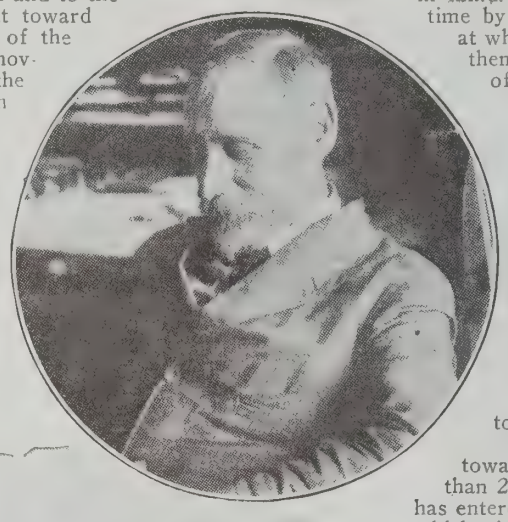
The committee of three claims to represent "Young Alsace." Some of its arguments are fatuous but they are not without good logic, and when that logic is founded on self-determination, it gains strength.

Of course the Republic is doomed to confine itself to the house in Baden-Baden.

But it is an interesting situation. And the postage stamp is easily the prettiest design in all Europe.

"John Brown's Fort" at Harper's Ferry, W. Va., is here shown in use as a fertilizer and farm implement storehouse. It has been torn down since this photograph was taken and removed to the campus of Storer College, which is a school for colored students, just above Harper's Ferry. In this building, John Brown, the noted Abolitionist leader and a score of whites and Negroes fortified themselves. After an all-day fight Brown and 6 men were captured and subsequently executed. The "fort" itself stood where the Harper's Ferry railroad station now stands until it was torn down, sent to Chicago and there erected again as an exhibit for the World's Fair in 1893. The building was used merely as a storehouse for a number of years. Recently Storer College secured possession and now uses it as a museum.

Hurricanes Robbed of Their Destructive Power



By HARRY H. DUNN

CITIES along the Gulf of Mexico Coast of the United States are resting easier, ship owners have lost half their worries, marine insurance rates are dropping and the families of ship officers and sailors are no longer the prey of the storm-fear, since the weather bureau of the United States Department of Agriculture has announced the discovery, by Dr. Isaac M. Cline, forecaster at New Orleans, of a new and accurate method of foretelling the coming of these hurricanes, within 10 to 12 hours after they enter the Gulf of Mexico, and from 24 to 48 hours before they become dangerous to coastal cities or to shipping leaving any of the ports.

For twenty years, Dr. Cline, who has been stationed in the service of the weather bureau all along the gulf coast, from Key West on the east, to Galveston on the west, has been working on his theory that the height of the tides along the gulf coast tell accurately of the approach of the hurricane long before even the sensitive barometer warns of the coming storm, and that these tides not only tattle on the hurricane, but that they tell its location, direction, velocity, destructive ability, and approximately where it will hit the shore.

During those twenty years, from the beginning of 1900 to the end of 1919, despite the work of the barometer, of wireless warnings from ships, and the steady labor of observers all along the coast, hurricanes raging into the Gulf of Mexico from their mysterious birthplace in the tropical Atlantic took 7,225 lives on the gulf coast of the United States, and inflicted property damage of $105,642,000. This is an average of rather more than 360 lives a year, and property loss of $5,282,100 every twelve months, though, as a matter of fact, all this destruction of life and property occurs in the months of August, September and October. The storms are annual events.

Contrasted with this are the figures for the year 1920, the first hurricane season in which Dr. Cline's new method of warning by the height of the tides has been in effect. This year, though the hurricanes were severe, and one of them in particular hit inshore shipping and the coast with terrific fury, only 18 lives were lost, two rather small vessels wrecked, and damage to ports and towns estimated at less than $100,000. The answer to this great problem in subtraction, of course, is that the cities and towns and ports, the ship operators, the fishermen and the people generally had time, in the four days of warning given by Dr. Cline and the New Orleans branch of the weather bureau, to prepare for the storm, to know just where, at what times, and with what force it would hit. Next year, the loss probably will be almost nothing, provided all ship owners heed the warnings, all the fleets of small boats lay in their berths and the towns prepare their water front properties for the hurricane, which, according to Dr. Cline, is very punctual in keeping the dates the rising tides make for it.

Top—Dr. Isaac M. Cline, district forecaster, stationed at New Orleans, whose discoveries rob hurricanes of their terror; second—A so-called storm-wave; third—Studying barometer at Shipping Board's engineers' school; bottom—Studying rescue of persons from storm-stricken vessels.

The secret of the discovery is merely this, in Dr. Cline's own words, as he told it to the correspondent of THE DEARBORN INDEPENDENT.

"With the approach of a hurricane to the gulf coast, the tides rise from the center of the hurricane's path to the right of that path, and are lowest at the left of the course the storm is taking. Thus, if a hurricane be approaching the coast, between, say, New Orleans and Mobile, and if the tide is notably higher along the mouth of the Mississippi River, and notably lower on the Mobile coast, then the hurricane will strike closer to the mouth of the Mississippi, and New Orleans, than to Mobile. This announcement would be known to the tide observers from 24 to 48 hours before the barometer gave warning of the coming storm."

Quoting his own statements from a recent United States Weather Bureau report entitled, "Relation of Changes in Storm Tides on the Coast of the Gulf of Mexico to the Center and Movement of the Hurricanes," he says:

"The waves and swells of greatest size and length are developed in the near right-hand quadrant of the cyclonic area, and move through the smaller waves in the front of the storm, and are carried by inertia to the shore in the direction in which the cyclonic area was advancing at that time. The waves sent out in other directions, being smaller and shorter, do not persist long after leaving the cyclonic area and soon flatten out and disappear. The transference of water with the long waves and swells causes rises in the water along the coast, which increase as the storm approaches. The rise of water along the coast, in front of the line of advance of the cyclonic area, beginning 12 to 24 hours after the hurricane enters the gulf, indicates the rapid movement of the waves through the storm area and across the gulf.

"From a study of the movement shown on the different charts and figures, collected by me during the past twenty years, this speed is shown to vary from 30 to 45 miles an hour. The rapidity with which the waves travel depends both on the extent of the cyclonic area and the intensity of the winds that develop the waves and swells. The water rises at the shore in the front and to the right of the point toward which the center of the hurricane was moving at the time the waves started on their journey.

"The rise at shore of the water from the hurricane shows long in advance of any change in the barometer. Take, for example, the hurricane of September 11-14, 1919: When the barometer at Burrwood, New Orleans, Galveston and Corpus Christi was either stationary or falling only a few hundredths of an inch, the water, first at Burrwood, later at Galveston, and then at Aransas Pass, was rising by feet, telling the story of the movement, and of the change in the course of the storm as plainly as it could be told without words.

"In using the information conveyed by the tides in forecasting the movements of hurricanes, the tides as predicted by the Coast and Geodetic Survey should be plotted for each hour, whenever a storm appears on the gulf. The height of the tide above mean low tide should be telegraphed from coast stations with each observation, and these should then be plotted over the predicted tides. The place where the water exceeds the predicted tides, and continues rising, is in the line of advance of the hurricane at the time that particular water started on its journey.

"The intensity and extent of the hurricane are indicated—when the hurricane itself is at a considerable distance of space and time—by the rapidity of the rise in the water and the extent of the coast over which that rise is taking place.

"The time between the commencement of the rise in the water at shore and the arrival of the hurricane will depend upon the rapidity with which the cyclonic area is advancing, and the intensity of the hurricane.

"If the point of greatest rise in the tides shifts to right or left, this shift indicates that the storm is changing its course in that direction toward which the increased rise is taking place. When the crest of the storm tide is coincident with the crest of the regular tide, the height of the water will be greater by more than one foot for hurricanes of equal intensity, than when the crest of the storm tide is coincident with low tide, and in forecasting storm tides this must be borne in mind. The regular tides are not obscured at any time by the storm tides, except at or near the point at which the storm moves, or will move, inland, and then for only about 12 hours before the passage of the center of the hurricane.

"The highest water occurs a few miles to the right, and about the time of the passage, of the center of the cyclonic area. At points on the coast some miles to the right of the line of advance of the center of the storm, the highest water occurs on a line drawn through the center of the cyclonic area at right angles to the line of advance of the hurricane, about the time of the passage of the center of that storm across that line. The high water extends for only a short distance to the left of the point where the center of the storm moves inland. High water, however, is experienced to the right of the center for a distance varying from 100 to 200 miles.

"The water commences rising at the shore toward which the cyclonic area is advancing less than 24 hours after the center of that cyclonic area has entered the Gulf of Mexico. The waves and swells which give this rise must have moved through and out of the rear right-hand quadrant of the storm area within 12 to 15 hours after the center of the storm entered the Gulf of Mexico. This indicates that with a 'fetch' of 150 to 200 miles in the rear right-hand quadrant of the cyclonic area, the winds furnish sufficient energy to develop waves and swells of a size and length that travel 30 to 45 miles an hour, reaching the middle gulf coast, 400 miles distant, in 10 to 15 hours, and to reach the Texas coast, 800 miles distant, in 15 to 20 hours.

"Strong currents are created in the right-hand segment of the cyclonic area, which move, in the main, coastwise, toward the line along which the cyclonic area is advancing. The fact that two gas and whistling buoys, in the storm of August, 1915, and three in that of September, 1919, were carried two to eight miles, nearly parallel to the coast, shows the force of these currents. If these buoys had been moved by waves, they would have been carried in toward the shore, and not along the coast.

"The high water attending the hurricane is frequently referred to as a 'tidal wave,' or a 'storm wave,' but it is not a wave in any sense of that word. It is a culmination of the water from successive 'storm waves' reaching shore, covering a period of two or more days, with a gradual rise which increases as the center of the storm approaches.

"The 'storm tide' results from the physical forces of the hurricane, driving the large waves forward and transferring the water in the same direction as the line of advance of the hurricane. In the open sea this 'storm tide' is not so great, probably not exceeding, in the greatest storm, more than five feet. The obstruction formed by the coast line acts as a barrier and the water gradually banks up, as it does against a dam thrown across a stream.

"The rise in the water at shore frequently is against opposing off-shore winds, as was the case in 1900 and 1915 at Galveston, Texas, and in 1919 at Corpus Christi, Texas. In such cases, the off-shore winds force the waters backward on the stream, retarding the rise. Then, when the winds shift and come in with the storm, the rise in water is much more rapid, and, consequently, much more destructive. The diminished pressure near the center of the hurricane will have some effect on the height of the water. The weight of one inch of mercury is about equal to that of one foot of water. Thus, the increase of the height of the water due to diminished pressure at Galveston, during the 1900 storm at Galveston, for example, with the barometer at 28.48 inches, could not have exceeded 1.5 feet, yet the storm tide was 15 feet."

With this ability to foretell virtually all necessary information regarding an approaching hurricane, shipping on the Gulf of Mexico can be warned of a storm more days in advance than are required to cross the gulf. In other words, a steamship in the middle of the Gulf of Mexico, warned immediately a hurricane enters either the Yucatan Channel or Florida Strait—the two most usual avenues of entrance for these storms from their little known point of origin in the tropical regions of the Atlantic—has abundant time either to proceed to safety out on the Atlantic by the channel through which the storm is not coming, or to seek anchorage in a harbor of the West Indies or of Mexico, or even to return to the ports of some one of the five states which border on the New World Mediterranean. Similarly, shipping can be held, at a flash from the wireless, at those gulf ports whence the sea lanes of trade would lead them across the hurricane's path, while those ports from which the paths of shipping would not meet the advancing storm can send out their fleets as usual. Shipping coming in from south or north or east or through the Panama Canal likewise can be warned, and can so alter their courses as to miss the storm, or can lie up in convenient ports until it has passed.

A New Gladiator Enters the National Arena

THIS is the first of two articles on the great "farm movement" in the United States. It summarizes the growth of co-operation and organization among the farmers and reveals some degree of the astonishing strength and scope of their activities.

As "once the embattl'd farmers stood and fired the shot heard round the world," so the farmers of today are preparing to enter upon a legislative battle for what they consider their economic freedom.

A second article will deal with the farmer's grievances and will outline the program of legislation which he is determined Congress shall consider.

THERE are certain signs, not difficult to read, which would seem to indicate that this nation is approaching a new legislative era, an era which will be the third distinct period of the kind within the memory of the present generation.

Back in the days of the McKinley tariff it was industry that received the attention of the lawmakers. Then labor pushed its way to the front and now we have the farmer. Powerfully organized, united in his desires, the agriculturist stands waiting the coming session of Congress to step forward with a program for farm legislation which, if accepted, will bring about as vital changes in the nation as have any of the measures passed during the last 20 years at the behest of either industry or labor.

Agriculture has long lagged behind the movement of the age toward combination. This slowness to respond to the impulse of all modern industrialism to combine resources and to do business on a large scale may be due in part to the fact that the farmer is an individualist, but at any event, the farmer remained aloof during all the earlier years of the era of organization and co-operation.

No longer than five years ago there were many who questioned the feasibility of the Federal Farm Loan on the ground that the American farmer is constitutionally averse to conducting any sort of business in combination. Since then this project has taken root in even the richest farming communities and to its influence may be attributed the awakening of the farmer to the value of collective effort.

Co-operate farm mortgages have revealed in an astonishing way the supreme position of the land as security in times of stress and the farmer, realizing that he is in possession of the premier security of the nation, has made up his mind that he must organize as the best means of promoting and protecting his interests.

Of course, farm organizations of some sort have existed in the United States for 75 years. The Grange, the Farmers' Unions and the Equity Societies have been unceasing champions of the need for united efforts and have done practically all the pioneer work. For many years they were only moderately successful. That they lived through the long, lean period is a tribute to the courage, the purpose and the farsightedness of the men who directed them. Now the tide has turned. The movement has suddenly gained strength and has developed such an impulse toward organization, such a haste to catch up, such a belief in the efficacy of organization, that the multiplicity of movements, unions, bureaus, councils, societies, boards, federations and confederations becomes almost confusing.

A recital of the mere titles of those national organizations that are concerned with the general agricultural interest is impressive. There are the Granges, the several Societies of Equity, the National Conference on Marketing and Farm Credits, the National Co-operative Association, the Farmers' Educational and Co-operative Union of America, the National Farmers' Congress, the Farmers' National Council, the National Federation of Farm Bureaus, and the American Agricultural Organization Society. Of the great organizations named only three extend back in origin to the last century and the majority have come into being in the last decade, while several of the most important and active are the growth of the last four or five years.

In a survey of farm organizations one notes that they are roughly separable into two sorts of organizations. The first is concerned with general principles and purposes, originating in the social sense, and some of these, notably the Grange which is the oldest of all, include the whole farm family in their membership and have rituals, following the custom of secret orders. But beginning in this local way to meet a social craving, they have widened out into federations and as they have done so they have come to express the farm thought on problems and issues that touch the farm interest nationally. Highly organized and important bodies of this last mentioned character are the Grange, the Farmers' National Congress and the American Association for Agricultural Legislation. The other is primarily and directly concerned with the farmers' specific business and is co-operative in the ordinary business sense for profit of the members. Of this class are the Farm Unions or Farmers' Educational and Co-operative Union of America, the three independent federations of Societies of Equity, the National Agricultural Society, which operates more as promoter and advisor than as an actual co-operative business in itself. These several national co-operative societies have hundreds of local societies.

A still further distinction may be made among the farm organizations for there are a number that are not strictly bodies of farmers but confederations of affiliated bodies whose national headquarters, ordinarily at Washington, stand for the farm interest and represent it before the country. Such are the National Board of Farm Organizations, the Farmers' National Council and, in a degree, the Farmers' National Congress.

In addition to these there are other movements springing up which are backed by traders and leaders of finance. They are young yet and there has been scant opportunity to observe their purpose, but it seems altogether probable that the intent of those who have sponsored them is to fashion them into opening wedges through which entrance may be forced into the inner councils of the farm movement. It is a shrewd plan and may be fairly accepted as proof that at least some of the captains of trade recognize the quarter from which the next great national movement is coming.

No doubt the branching out of the farmers' retail, wholesale and manufacturing enterprises has been partially responsible for awakening these men to what is taking place. Six years ago there was said to be not over 500 or 600 co-operative concerns in the United States. Today the number exceeds 4,000, handling, as the secretary of agriculture estimated in the last annual report of his department, upward of $1,500,000,000 annually through the marketing of farm products, the operation of elevators, warehouses, fire insurance companies, wholesale houses, retail business and the purchase or manufacture of goods.

The farmer does not stand upon ceremony in his organization meetings. He will use anything from a circus tent to a village hall.

In order to understand the strength of the farmer politically as well as economically, one will do well to study the organizations which he has built up, noting their scope, their efficiency and the great number of their members.

One of the typical co-operative societies will answer for all, therefore let us consider the Farmers' Equity-Union, one of the three large Equity Societies. This body was organized in 1910 in Illinois and operates chiefly in the Middle West. It is selected for description over all other like societies because of its unique feature of central exchanges. The local exchanges are organized at small market points and are carefully chosen. They market the products of their members and purchase machinery, lumber, coal, fertilizer, flour, butter and other commodities. At the close of the year there is a fixed three per cent dividend to stockholders and a distribution of profits or savings, the individual member's return being prorated according to the business he did with the exchange.

The large central exchanges of this society are situated at Denver, Kansas City, Chicago and Lima, Ohio. These are also stock corporations, the stockholders being the local exchanges. There is a three per cent dividend and a distribution of profits. The Equity-Union conducts what is probably the largest co-operative creamery in the nation at Aberdeen, South Dakota, doing a business of approximately $10,000,000 a year.

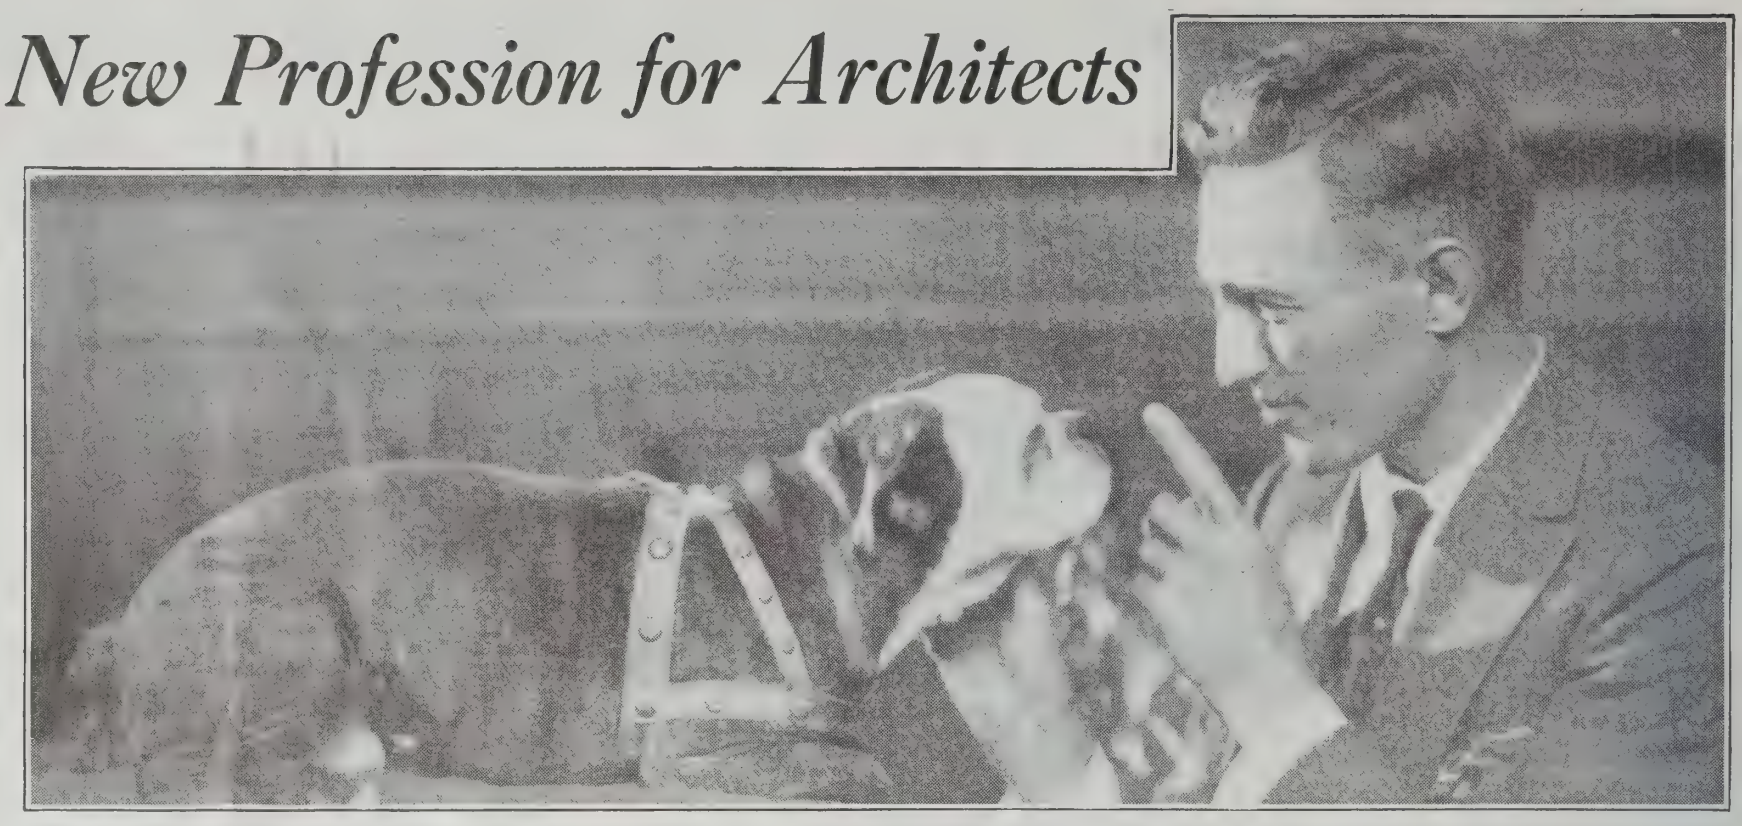
To obtain a sense of the scope of the present farm organization movement, however, one must also make a brief survey of the class of organizations which are not distinctly co-operative but represent the general farm interests. In doing this one naturally begins with the Grange, of which it is scarcely necessary to say more than that it is the oldest and best known, as well as one of the most powerful and extensive of all farm bodies. It was organized in 1866 and its annual meeting is attended by 4,000 delegates representing 600,000 members, most of whom are in the states of Maine, New Hampshire, New York, Pennsylvania, Ohio and Michigan.

The National Board of Farm Organizations is a confederation of thirteen large national farm organizations. In a sense it is the clearing house through which they voice their sentiment on national legislation. It has headquarters at Washington and is one of the most powerful exponents before the public of the common thought and interest of the American farm.

An organization with a somewhat similar purpose, although essentially political, is the Farmers' National Council, a bureau conducted at Washington. In spite of many bitter controversies with more conservative and less political farm organizations, the National Council has survived for 10 years and is more active today than ever before.

A national body which is quite unique in its organization is the Farmers' National Congress. It is a pioneer national agricultural body growing out of a meeting of representative farmers in 1881. From that year it has met annually to discuss agricultural problems and political questions relating to farm interests and is one of the most powerful exponents of the agriculturist. It is constituted of members named by the governors of states or by the state agricultural society, in case the governor fails to act. Members of the congress must be men engaged in agriculture and are usually representative and leading figures in their states, often with a national reputation. The significant feature of the Farmers' National Congress is the annual platform of resolutions, always a comprehensive utterance in behalf of the American farm. It is represented in Washington by the National Board of Farm Organizations.

One of the youngest and still most powerful of the greater national farm organizations is the National Federation of Farm Bureaus. It originated in the Middle West in the organization of a few local farm bureaus, whose only purpose at that time was to aid the local farmer by bringing him expert advice and modern scientific agriculture as taught in the agricultural colleges. These bureaus employed a local or county farm agent at a salary to visit farmer-members on call without cost to them other than their annual dues of $2.



Looked upon with suspicion and derision at first by practical farmers, the farm agents very quickly overcame these prejudices and the farm bureaus soon spread from county to county and from state to state, so that within four years a national organization was formed in which more than 37 states are represented with a total membership of almost a million and with a fund of $200,000 available annually for any work which the national body undertakes. Young as it is this giant among the farm organizations seems to have found itself and to have developed very definite plans for the future.

Some idea of the influence which the organizations briefly described here have already had upon the course of national legislation may be obtained from reading over a partial list of the measures which they have sponsored and helped to place on the statute books. These bodies were a power in urging the creation of the interstate commerce, they backed postal savings banks, the pure food laws, parcel post, rural credits, prohibition and restriction of immigration.

While it has been necessary to omit reference to many strong organizations, enough has been set forth to suggest the extent and earnestness of this movement. It is evident that co-operation has taken firm root in the soil of the farm and that its growth has been spontaneous and sincere rather than artificial.

It must be very evident also that these organizations, representing two-thirds of the farmers of the nation, have invested the agriculturist with a new political dignity and that the time has passed when the politicians can wave him away. The farmer himself knows this and the next Congress will certainly see his forces in the field behind the broadest legislative program ever framed by the agricultural interests.

New Profession for Architects

ELMER E. SHEELEY, art director of one of the largest film studios in the country, and "Fifty-Fifty Boy."

By JOHN B. WALLACE

IT HAS always been the pride and ambition of the architect to build something substantial, something that will last, a monument to his genius that would preserve his name to posterity. And now comes the moving pictures to offer him a field in which all of his masterpieces are embalmed in celluloid. The actual set which he designs is as ephemeral as a woman's whims but the picturization of it may be preserved for centuries.

But does he appreciate it? Elmer E. Sheeley, art director for a film company in California, says he does not. Mr. Sheeley ought to know, for he has eight of them working constantly under his supervision.

"The boys certainly grumble a lot," he explained with a smile. "They claim that we depart from every method of technique and design that they have been taught. Perhaps they are right. But we are giving them as much as we take away."

"Probably the statement will provoke a storm of criticism from the architectural profession," he went on seriously, "but I maintain that the profession will be richer from the advent of the motion picture. We are teaching them that they can do things which they have asserted were impossible. They say it can't be done and then they go ahead and do it."

Mr. Sheeley is not an architect himself although he has been a draughtsman. He was a scene painter in St. Louis until 1915 when he came to Los Angeles to work for Flagg as a foreman in that great scene painting house. Mr. Sheeley saw the future that was opening for his craft in the new industry and six months later had joined a film corporation. From there he went to the company by whom he is now employed, where he has charge of the designing of all the sets built in the immense studio.

Mr. Sheeley's experience in the technical details of stage work has fitted him admirably for his present position. Exterior sets are after all only interiors on a larger scale. And interior sets in the motion pictures apparently differ very little from the regular sets on the stage of a theater. The differences that do exist are caused by the fact that one is to be viewed directly by the human eye and the other through the eye of the camera. A slight difference indeed to the uninitiated but one of immense importance to the men who make pictures.

The art director in motion pictures bears somewhat the same relation to the technical director as an architect does to a contractor in ordinary construction work. The art director has charge of the designing of the sets while the technical director has direct charge of their construction.

The first thing that the producer does when a new picture is contemplated is to give a copy of the script or scenario to the art director. He is usually given the first or at least the second copy because he must have the sets built before the picture can be made. Even before the scenario is written the outline of the plot is given the research man who must delve into the literature of the period in which the story is placed. He then puts the information he has gathered at the disposal of the art director, who plans his sets and puts his draughtsmen to work.

The work of a scenic draughtsman is of an extremely varied nature. One week he may be designing a Moorish castle or a Grecian sarcophagus, the next a modern bungalow or a group of houses in a village street.

Very little of his work can be original. The greatest asset of the motion picture is realism and the scenes must be laid in spots that actually exist. Therefore the motion picture architect must be essentially a copyist. But what a school it is for him! It would be strange indeed if new and startling developments in architecture are not evolved from this varied and most unusual experience.

"I had one man working for me," Mr. Sheeley stated, "who had been a teacher of architecture in college. When he left us to go into other lines, he said that his experience in the pictures had taught him lessons that he considered invaluable."

The majority of the architects in the motion picture studios are young men. It is a young man's game. Youth proves more adaptable, more receptive to new ideas. But not even all young architects make good.

"Our greatest difficulty," said Mr. Sheeley, "in breaking in new men, and this applies to both young and old, is that they wish to build their sets too substantially. They lay too much emphasis on stress and strains. They do not realize that a good steel cable will hold a set so solid that it will stand in wind and earthquake where big brick and stone buildings will be demolished."

"I had to let a man go a short time back," he continued, "for that very reason. He was an excellent designer. When he designed a set it was perfect in every detail and it was built for keeps. But he spent too much time on unnecessary details. He was too conscientious. In what might be called legitimate architectural work he will be a success but not in this business."

Perhaps the greatest asset gained by young architects in the motion pictures is the study of angles through the eye of the camera. In no other business are things so far from what they seem.

The problem of the architect therefore is to know what parts of his building to elaborate and what parts he can skimp. He learns this through a study of the script of the play that is to be filmed but the scenario does not tell him all. He must have some practical knowledge of the possibilities of the camera and this knowledge is only gained through actual experience.

There has been a great change in the business management of the motion picture industry in the last few years. A director can no longer squander carelessly vast sums in filming a picture. He must account for every cent he spends. Consequently it is up to the architect in designing his sets to plan his work so that there will be no unnecessary expenditures. Their motto might be paraphrased, "A million dollars for effect but not one cent for waste."

Mr. Sheeley is now engaged on a picture that will run well into three quarters of a million dollars before he will be able to call it finished. This is not stage money but real hard cash, as anyone who has seen the sets can realize.

One set is an exact replica of the casino of Monte Carlo. It was estimated that the set would cost $65,000 to build. The other day when I saw this set it was about two-thirds completed and the cost had already exceeded the original estimate of the finished structure. There are half a dozen other large sets belonging to this same picture. This of course is to be an unusually big production but few of the so-called feature pictures run under $100,000 in expense. Some of these sets will not be a total loss after the picture is completed. The Monte Carlo set for instance will probably be allowed to stand and can be rented to other companies which may need that particular setting for a picture.

Quite a number of the larger sets are built with a view to permanency. Universal City is dotted with such sets, among them being a New England street, a Louisiana street and a western street. Another interesting set is an exact replica of a section of Chinatown in San Francisco. The realism in these sets even goes so far as to provide the banana peels and other rubbish on the streets.

The illusion is so perfect that it is almost impossible for the visitor to realize that the backs of the buildings in these streets are nothing but a mass of studding and framework held solid by strong steel cables. This is of course not true of all of them, some of the cottages, churches, and so on, in the village streets being bona fide structures.

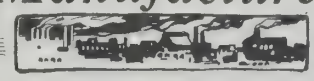
It requires an enormous amount of research work to obtain such fidelity to details and in order to cut down expense and get better results, the art directors of the various studios around Los Angeles have formed an association. The association employs men who do nothing but research work. They have collected a splendid library which is at the disposal of the members and are prepared to answer any and all questions regarding the habits, costumes, architecture, and so on, of the people of any period in the history of the earth. For the first time in history the antiquarian has been provided with employment that is lucrative as well as interesting.

The art of camouflage which came into prominence during the World War is carried to the nth degree in the pictures. In fact most of the experts in that line were recruited from the movies. But often what will fool the naked eye will not fool the camera and this opens up a new line of study for the art and technical directors.

The art director not only employs a number of architects and draughtsmen but he also has a corps of scene painters. Many of the illusions in pictures are the same as upon the stage; for instance, an interior may be used in which is a view through an open window. Now it would be a matter of great expense to build the sets required to give this perspective. Instead the scene painter is called in and he so deftly paints a view of the outdoors that the spectator never realizes that he is gazing upon canvas instead of nature.

The position of art director in a film corporation is no sinecure. He must have a general knowledge of architecture, painting, electricity, photography, history and practically all of the arts. He must have a keen sense of the artistic as well as be a practical man of affairs. Such men are rare and are paid accordingly. It is a new profession opening up to young men and one with a big future. The art and technical directors are ranked with the stars in importance in a motion picture studio and while the public hears little of them the producers well know their worth.

Mr. Sheeley pointing out some of the mosaic work on a set for a $750,000 film.



The Three Arts

Agriculture

Manufacture

Transportation

According to statistics prepared by the Interstate Commerce Commission, the cost of operating a freight train was $1.89 in July of this year against $1.54 in July of 1919, an increase of 23.2 per cent. In February, 1920, the last month of government ownership, the cost was $1.91.

It is estimated by the Mexican embassy that Mexico will produce 144,000,000 barrels of oil this year. This is one-fifth of the world's production.

Successful experiments on a large scale convince the Department of Agriculture that a practical method has been found of saving peach orchards from the peach tree borer. Crystals of an insecticide are sprinkled around the base of the infected tree and covered with earth. The substance forms gas which kills the borers. Millions of dollars have already been saved to Georgia orchard men through this discovery.

The British Admiralty is making tests of a new motor fuel known as natalite which is said to be a by-product of sugar factories.

The dairy division of the Department of Agriculture is assisting dairymen of Dubois, Pennsylvania, to conduct a co-operative milk distributing plant.

The miners of the country took three holidays election week with a consequent loss in production of 714,128 tons of coal—enough to have supplied a city of 200,000 population for a year.

England is attempting experiments in surfacing highways with slabs of a rubber-like composition which deadens the noise of heavy traffic.

At a general meeting held in the city of London recently, the shareholders of the Direct United States Cable Company accepted an offer from the British Government to purchase the company's properties, equipment and stock cable, for the sum of 570,000 pounds sterling.

Clothing manufacturers insist that clothing prices will drop until next spring finds the price tags reading only 25 per cent more than the prewar figures.

Republican members of Congress who are now in Washington say that there is no hope for reduced taxes until 1923.

The first steps have been taken in the formation of a national organization of canning crop vegetable growers. The Federation of Farm Bureaus is fostering the movement.

While each increase in the price of gasoline is exasperating to the motorists, it is interesting to note that these increases amount to much less in the course of a year than is generally supposed. An increase of five cents a gallon, for instance, means but $17 to the man who drives his car 5,000 miles in the course of a year and who gets 14 miles to the gallon.

France faces a deficit of from 300,000 to 400,000 tons of fresh meat yearly for some years to come. The shortage will be met in part by the use of fish, but much frozen meat will be imported.

For the first time in four years flour has gone below $10 a barrel.

The latest government estimate of the grain crop of Canada makes the yield of wheat nearly 4,000,000 bushels more than at the end of August. The total yield of wheat is now put at 293,361,000 bushels compared with 193,260,000 bushels for 1919. The acreage yield of all wheat per acre for the whole of Canada is put at 16 bushels compared with 10 bushels last year.

Europe's debt to the United States, incurred since the armistice, in private commercial transactions, now exceeds $3,000,000,000 and closely approaches $3,500,000,000. Exports to Europe upon an unprecedented scale account for some of this unfunded balance. Officials state that fluctuations in exchange may become severe at any time.

The dairy division of the Department of Agriculture reports that many creameries throughout the Middle West have cut fuel bills 20 per cent by utilizing their exhaust steam.

The Mexican sugar crop of 1921 is estimated at 100,000 tons. Forty thousand tons of this will be exported.

The Calumet & Hecla and subsidiary mining companies have made a 15 per cent cut in all wages and salaries.

Birmingham, Alabama, is to have a new hydro-electric plant costing over $10,000,000 and will furnish 120,000 horse power.

Transatlantic freight rates are falling as a result of a rate war over the lessening quantities of exportable goods.

Plant diseases, which might have been prevented, cost the farmers of the United States tremendous losses in 1919. The following figures of losses are official; wheat, 112,000,000 bushels; oats, 50,000,000 bushels; sweet potatoes, 40,000,000 bushels; tomatoes, 185,000 tons; cotton, 850,000 bales; peaches, 5,000,000 bushels; apples, 16,000,000 bushels.

The Department of Agriculture advises that pullets be moved into winter quarters before they begin to lay.

The Australian Government handles all grain, storing it, making export sales and chartering ships. The only charges assessed against the farmer will be the government's actual expenses. There will be no middleman's profit.

The Bureau of Markets announces that it has just completed the task of running down a story that 80 carloads of potatoes were dumped into the Delaware River and that the yarn has absolutely no foundation. Stories of food dumping, the bureau states, are usually without foundation.

President Wilson has appointed Admiral W. S. Benson chairman of the Shipping Board for a term of six years.

The American Forestry Association has announced that a united campaign will be made at the next session of Congress by all interested industries, for a national forest policy.

The British export prohibition of condensed milk has been removed.

Investigation by government agents has shown that it does not pay the farmer to tan his own leather. The results are uncertain and the hides are seldom of a high enough quality to command top prices.

Fur buyers are authority for the statement that the supply of muskrat skins is decreasing at the rate of 50 per cent annually.

The Association of Railway Executives announces that the car shortage is being overcome.

The Interstate Commerce Commission denied the application for the Southern Pacific Railroad for a government loan of more than $5,000,000 to purchase new equipment.

New Government Publications

Diseases of Apples in Storage. Farmers' Bulletin 1160. Department of Agriculture. Free.

Feeding Garbage to Hogs. Farmers' Bulletin 1133. Free.

Effect of Winter Rations on Pasture Gains of Yearling Steers. Department of Agriculture, Bulletin No. 870. Free.

Thermal and Physical Changes Accompanying the Heating of Hardened Carbon Steels. Scientific Paper No. 396. Price 5 cents. Bureau Standards.

How to Build a Home Ice House. Farmers' Bulletin No. 1078, Department of Agriculture. Free.

Tree Surgery. Farmers' Bulletin 1178. Department of Agriculture. Free.

Spotted Apple-Tree Borer. Department Bulletin No. 886. Department of Agriculture. Free.

The second national boys and girls' dairy-cattle judging contest was won by a team of three boys from Missouri. The Illinois team won second place and Texas took third.

The Association of British Chambers of Commerce has resolved that there should be no English resumption of trade with Russia until that nation pays her old debts.

China exported almost $1,000,000 worth of carpets to the United States in 1919.

The Geological Survey reports that the use of oil as fuel, in place of coal, is growing very slowly. Only in the regions near the oil fields has the change been such as to make oil a competitor of coal.

Despite many statements which have been made to the contrary, experts in the government service declare the feeding of garbage to swine is a practical means of pork production. A new bulletin, No. 1133, has been issued on the subject by the Department of Agriculture.

Experiments carried out by the Bureau of Markets show that baled cotton suffers severe damage by long exposure to the weather. A bale of cotton, left in the open on the ground was damaged to the extent of 370 pounds in eight months.

The number of automobiles exported by American firms during the fiscal year of 1919-20 has increased enormously over any previous year. Commercial cars sold abroad numbered 24,345 and passenger cars, 115,519.

The rapid agricultural development of their section of the country and the high cost of farm labor has induced the farmers of Saskatchewan to spend $6,000,000 for tractors this year. Districts which were known only to hunters and trappers a short time ago are now producing record-breaking crops.

The secret service issues a warning against a counterfeit $20 Federal Reserve note on the Federal Reserve Bank of Kansas City, Missouri. The counterfeit is printed from photographic plates, on two pieces of paper. The bill is too thick and is half an inch short.

A conviction has been obtained under the new Pennsylvania law which makes it a misdemeanor to issue a check when there are not sufficient funds credited to the account to pay it.

The Panama Canal earned a net profit of $2,387,599 during the fiscal year ending June 30.

Public ownership is growing in Canada. It is announced from Ottawa that $1,120,000,000 has been invested in publicly-owned enterprises. These include railways, telegraph lines, telephone systems, waterworks, electric light and power plants.

Serious attention is being given to the problem of preventing the Mississippi from changing its channel and leaving New Orleans high and dry. A conference of 227 Federal, state and city officials was held recently in Louisiana.

Private operation of the railroads for the first six months after the end of Federal control will cost the Federal Government a total of $656,000,000, according to the Interstate Commerce Commission.

The United States dollar was quoted at 7 pesos in Chile recently, the highest since early in 1915. The price has climbed from about 5 pesos during the last four months. Heavy fiscal expenses, depreciation in the value of raw material for export and increase in values of imports are said to be causes contributing to the decline.

"American agricultural machinery is important in Norway," states Nels A. Bengtson, of the Bureau of Foreign and Domestic Commerce. "In general the high quality of American tools and mechanisms is conceded and the expression is frequently heard that American goods rank first in quality but are somewhat higher in price."

The United States Shipping Board sold vessels aggregating $24,676,040 between August 1 and November 1. Fifty-nine ships were sold.

Briefly Told

The census of the seal herd on Pribilof Islands this year shows as a total, 1,500,000 seals, the largest number known since the government took charge of the seal industry.

Due to improper ventilation in the mines at least 1,000 metal miners die annually in the United States, causing a loss of time aggregating millions of dollars and untold suffering to the miners and their families.

Strong tobacco smoke blown into glass cases containing small pieces of thin paper soaked in germ-cultures such as the bacilli of cholera, influenza, diphtheria, typhoid fever and meningitis proved that tobacco smoke can affect only the weakest germs and then only after long exposure, the experiment showing no affect on the typhoid and diphtheria germs.

A Franklin penny, the first copper coin to be authorized by Congress, has been found on the homestead of one of the settlers in Dover, Massachusetts.

The first flight made over the equatorial Andes was made recently by an Italian aviator flying from Guayaquil to Cuenca, a distance of 120 miles.

A Kentucky man "got mad" at a judge when sentenced to jail, and became a candidate for the judgeship. He defeated the judge, although still in jail, and the county is wondering what he will do if the judge ever is unfortunate enough to be brought before him.

There are fifty-four kinds of paper money in the United States.

An Ottawa, Illinois, banker was locked in his vault by a bandit. Failing to open the time lock, bank officials asked Joliet penitentiary to lend them an expert safe-cracker, but the warden was unable to find a graduate blower who felt capable of handling a modern safe.

On armistice day this year the United States Army, which two years before had numbered more than 4,000,000 men, was still 70,000 short of its present authorized strength of 280,000 officers and men.

A Kansas City policeman resigned because he was assigned to a muddy beat.

Oregon high schools paid $1,500 for sheepskin covers of diplomas of graduates.

The death rate in the United States in 1919 was the lowest yearly average ever recorded. The rate was 12.9 per 1,000 persons, and nearly 10 per cent of the deaths was from tuberculosis.

A boy in Newcastle, Indiana, found $1,300 worth of gold in a pot while digging a basement under a house. A daughter of the former owner of the house, and the farmer who now owns the place, both laid claim to the gold, but the judge ruled that "finders are keepers."

China has but 6,000 miles of railroads while her natural resources warrant the construction of more than 300,000 miles.

To eliminate gambling and opium smoking among Chinese in this country, the Chinese National Welfare Society in America is establishing industrial schools and persuading the Chinese to attend American schools where they may occupy their time and their thought with trades and industries.

Hungary signed the Treaty of Peace with the Allies with the draping of black flags and general mourning throughout the land.

During October there were residing in Paris more than 22,000 Americans, exclusive of tourists.

E. W. Stanford, of Farmersville, Texas, dug a sweet potato weighing more than 10 pounds.

Experiments made by a London scientist prove that bats are directed in their flight by a special sense of hearing and by sound waves.

A pound of sugar or butter in Russia costs a month's pay of an ordinary workman.

French cooking is not what it used to be, complain many visitors to France. It is becoming more and more difficult to find apprentices for the pastry trade.

The automobilist in London has only to sign a statement giving name, age, type of car, and so on, and pay $1 to obtain a license to drive.

Engineers seeking a good road up Mount Rainier found one already to their hand by using Nisqually glacier. A tractor solved the problem of taking tourists up the ice-river road.

All Warsaw went into mourning at the funeral of Sergeant Sophie Poukopwicz, "the Heroine of Plock," who died from wounds received in battle against the Bolsheviki.

In China 20,000,000 persons are being fed on a famine ration by relief societies.

There were fewer tourists in Cuba last winter than during any period in the recent history of that island, according to the Cuban commissioner of immigration.

The urban population of the United States is about 4,000,000 more than the rural, while in 1910 the rural was about 7,000,000 more than the urban.

Tarrant County, Texas, has erected a large apartment house at a cost of $16,000. Apartments in this building will be rented to teachers at a nominal rental of $5 a month to supplement their meager pay.

Mexico is beginning to divide fractionally the many large ranches of Sonora and is planning to sell the subdivisions to small farmers.

To stimulate building in New Jersey, it has been decreed that dwelling houses erected between now and October 1, 1922, will be exempt from taxation for the next five years.

It is estimated by the National Tuberculosis Association that $2,000,000 is annually thrown away by residents of New York City in the vain hope of curing tuberculosis and that fake "cures" defraud the public of this country of from $15,000,000 to $25,000,000 yearly.

The encroachments of salt water have reduced the Tampico oil field's production about 50 per cent in the estimation of prominent oil men in Mexico.

Armed bands of outlaws are attacking towns in the vicinity of the Hartz mountains in Germany, terrorizing the inhabitants, cutting the telephone wires and committing crimes.

A race of 40,000 head-hunting cannibals declared to be the smallest human beings, as a race, was recently discovered by an explorer in the New Hebrides.

Oil derived from the liver of sharks caught off the coast of California is used as a leather preservative.

The former German emperor's annual tax assessment will enrich the village of Doorn $13,265.

Maine has 5,151 rivers and streams and 1,620 lakes, according to a recent survey.

Yellowstone Park entertained 79,777 tourists during the 1920 season.

The United States supplies 69 per cent of the world's output of petroleum.

Important archeological finds have been made in Oregon recently. A prehistoric cemetery containing stone utensils and copper ornaments was unearthed at one point on the Columbia River and at another locality were found picture writings chiseled on the cliffs.

A plant for the manufacture of jelly from seaweeds has been newly established in California.

Because of fuel oil shortage, naval vessels equipped with oil-burning engines were recently ordered to reduce their speed.

When the 1920 census was taken a few months ago in Breckenridge, Texas, the count showed a scant 2,000 persons. Now there are 25,000 in the town. Oil, of course.

Plans for a paper conservation campaign to avoid waste and conserve scraps of paper were made at the opening session of the American Paper and Pulp Association's convention recently held in Chicago.

Consumers of soft drinks have paid $51,000,000 to the Revenue Department of the government. This would indicate that the soft drink business is in excess of $500,000,000 a year.

New England, self-supporting in lumber twenty years ago, now has to import one-third of the amount used. It has $300,000,000 invested in wood and forest industries employing over 90,000 wage earners.

Only 5.3 per cent of the farms in the United States are electrically equipped.

Saloons in all the larger towns of Mexico are to be closed from noon Saturday until 9 o'clock Sunday morning.

The United States is short more than 1,000,000 homes.

Chicago's city council advises the housewives of that city to bake their own bread and smash the high bread prices.

Statistics show that as cold weather approaches and work grows scarcer, the army recruiting stations do more business.

At the coming session of Congress a bill will be introduced to wipe out trading in grain futures where no grain changes hands. As the bill will affect only gamblers and will not interfere with the business of legitimate grain dealers, the farmers are in favor of its passage.

Military training has been compulsory in New Zealand since 1910.

Japanese who are leaving California because of the new anti-alien law in that state are going into Texas where during the last two months they have acquired by lease or purchase one-fourth of the irrigated land in the Rio Grande Valley.

Governor John M. Parker, of Louisiana, has issued a call for a meeting with the object in view of devising ways and means to prevent the Mississippi River from cutting a new mouth, through the delta, to the Gulf of Mexico, by following one of its old mouths, the Atchafalaya River, down to a point about 100 miles west of New Orleans.

The jinrikisha men of Japan have hitched their two-wheeled carriages to motor cycles, to the great increase of modernity, although at the loss of a certain picturesqueness.

To carry on its campaign for the election of officials favorable to labor cost the A. F. L. only $50,000, according to reports. The claim is made that "60 enemies of labor" have been defeated.

A certain territory on the coast of Peru has been set aside by the government and given over to American concerns for development in the belief that American machinery and methods will set an example in the raising of cotton, sugar and cocoa.

New York police have been assigned to stop motor vehicles on the streets and examine them, sending those in need of repairs to a garage and giving certificates of good condition to the others.

A handcuffed bicycle rider recently made a 10,000-mile trip through the eastern states in less than seven months.

The cost of the British Army of Occupation on the Rhine was 3,600,000 pounds sterling a year.

Approximately 190,000 immigrants will enter Canada this year.

The French franc, which has sagged in value from about 20 cents to about five cents is now known throughout the country by the good American name of "nickel."

Fill New Niches in Gallery of "Immortals"

An interesting story, with illustrations, on this year's election of illustrious Americans to the Hall of Fame at New York University.

Hope for the League: The Meeting at Geneva

In which Americans are presented with the British liberal thought which hopes for the entrance of the United States into the League.

Jewish Dictatorship of the United States During War

Bernard M. Baruch admits that he had more power than any other man in the war. You will agree with him when you read the scope of his authority. His hand touched every vital chord of national life:

Men for the Draft
The Cost of Living
Capital for Industry
Priorities for Power
Women for Factories
Materials for Production.

All this power was conferred upon him by Woodrow Wilson, the President who has been criticised for playing a "lone hand." He has been charged with being jealous of power. Both charges are untrue. He delegated great power to Jews and to Jew-controlled Gentiles. He counseled continually with a secret cabinet of Jews.

Christmas in the Pueblos of the Aborigines

A charming story, pleasingly illustrated, of the holiday customs and traditions of the New Mexican Indians.

Pancakes in Prison Like Bread Upon Waters

The chord of responsiveness struck by warden of Minnesota prison when he varied the diet of prisoners.

Mr. Ford's Page--Editorials--Short Features

There is as usual the splendid variety of editorial features, interesting illustrations and short bits of worth-while information.

Tagore, in America, Seeks Aid for University

The venerable philosopher of India discusses western and eastern universities, and the results that come from the two schools.

Many Men of Many Minds

Henry L. Doherty.—The petroleum business needs assurance that it can proceed in the development of new sources of supply in a competitive and non-restricted manner. Government regulation and medd'ing will check the initiative of oil companies, resulting in a restricted output.

V. Blasco Ibanez.—Our own society is indeed imperfect. It is something we have succeeded in getting by centuries of effort. Governments, perhaps, may be overthrown without too much disturbance. Whatever happens when a government falls, people may be sure that some other will take its place. But the overturn of a society, the destruction of what we have before we know what we are going to get, the desertion of a tested (even though defective) system to fall back on theories which have never been tried—that is a different matter.

W. G. Harding, President-elect.—We have only to be independent and free and untrammeled and unmortgaged to write the supreme fulfillment. We choose no aloofness, we shrink no obligation, we forsake no friends. We never have; we never will. But we built in nationality and we do not mean to surrender. We crave fraternity; we wish amicable relations everywhere; we offer peace and choose to promote it but we demand our freedom and our own America.

No Surrender of Nationality, Says Harding

Nicolai Lenin.—Russia will not feel safe until revolution has swept at least one country of Western Europe. Until that happens the Soviets always will be in danger.

Hugo Stinnes.—Germany in her present situation can pay nothing. Her financial and economic structure is so near collapse, and every condition related to or dealing with finances or industries is so shifting and so uncertain that there is absolutely no basis such as is inevitably necessary to proceed from. There is not a man or a commission in Germany, France or England who can say what Germany might eventually be able to pay. What we do know is that if present conditions continue we are going to utter ruin, and the day is not far distant when German money will have no value whatever.

Lord Rathcreedan.—The suspense and restlessness apparent in Europe regarding the attitude of the next administration of the United States toward America's entrance into an association of nations is needless. I find the opinion general throughout the nation that while the United States must safeguard the Monroe Doctrine and other American rights and institutions, the nation is prepared to enter whole-heartedly into co-operation for the reconstruction of Europe and will approve of any program which will prevent future wars.

Karl H. von Wiegand.—In the so-called death camps of Siberia the prisoners died so fast last winter that graves could not be dug fast enough in the deeply-frozen ground. The corpses were stacked up like cord-wood near the hospitals and allowed to freeze together solidly and were then buried at that spot when the thaw began. Before the ground began to freeze this winter great numbers of graves were dug at the camps to be in readiness for those thousands who will die before spring. These yawning graves, according to the returning men, have a most depressing affect on the prisoners at the camps.

Describes Yawning Pits Waiting for Their Victims

Herbert D. Brown.—I do not wish to minimize the importance of eliminating all waste in the government's civil establishment. I would have the people get full returns for every penny expended in running the government. But what I should like to have understood and understood clearly is that, whittle away as we may, we can only reduce the total public expenditures by perhaps a fraction of one per cent.

Guy Magee, Jr.—China offers today more allurements both to the legitimate promoter and to the professional exploiter than any other quarter of the globe. With four hundred million people, a market of tremendous potentiality already established, cheap, intelligent labor abundant, money worshiped, and a national spirit yet lacking—what could present a more inviting field for enterprise?

Clifford B. Upton.—America inevitably and automatically will become the greatest nation in the world, for it will become that of the most prosperous individual citizen. To my mind the most important detail of the education of American young people concerns this simple matter of thrift—and their elders need the teaching quite as much as they do, although I do not believe the habit (nothing more) can be as readily established among older people as among the young. That is what makes the teaching of it to the young a matter of such prime importance. If we could find some way of inducing the workers in America to save out of their income a tenth, the nation instantly would spring to an importance and a happiness hitherto unknown in human history.

W. L. McKenzie King.—Men there are in the ranks of both capital and labor, and among the professed friends of each, who care for nothing quite so much as their own position and importance. They see naught of the natural desire of other men to govern themselves; they are ever ready to sacrifice principle, and to foster prejudice, in order to gain power, whether its expression be found in position, in the acquisition of wealth, or in a multitude's applause.

Constantine, former king of Greece.—I insist upon a plebiscite for my return or the return of one of my sons. It is for the Greek people to decide.

S. M. Felton, president, Chicago Great Western Railroad.—It has been estimated that to enable the railways satisfactorily to handle the traffic now being offered and also provide for the growth of traffic, there ought to be built 30,000 miles of yard tracks and siding in the three years, 1920-1922.

General Leonard Wood.—We must keep a watchful eye on our immigration. We must see to it that this country is not flooded with undesirable immigration and that great numbers of people who have been engaged in destroying government, who have no sound ideas of government, are not allowed to crowd into this country already overloaded in many sections with unassimilated material. We must drop the idea that singing the national anthem and carrying our national flag on patriotic occasions is all that is necessary for Americanization.

Keep Watchful Eye on Immigration, Is Wood's Warning

James H. Collins.—The longer Bolshevism persists the greater will be its ultimate deficit among liberals and industrial workers everywhere, and the wider their recognition that present schemes of government are flexible enough for all purposes of improvement when people know how to use them to the utmost advantage.

Lincoln Eyre.—Italy's recovery from the economic ailments caused by the war, and from which she has been a greater sufferer, perhaps, than any of the other victorious nations, is largely dependent upon the "front" she presents to the rest of the world, at present far darker and menacing than it really is. Consequently foreign capital, disinclined to risk in far-off lands money that can be invested safely and almost as profitably at home, gives Italy the cold shoulder.

Professor C. T. Murchison.—From an economic point of view, the conclusion seems warranted that the seller's guaranty against price decline in a general sense serves no good purpose. In only exceptional circumstances does it actually contribute to the best interests of all the factors in industry. The investigations of the Federal Trade Commission reveal that a large percentage of those who resort to the price guaranty do so unwillingly and under protest.

Lieutenant Edward T. Harrison, U. S. A.—The people around Coblenz are better off than they have ever been in their lives. There are 16,000 in the American forces in Germany, and 9,000 of these are quartered around and near Coblenz. They spend their money freely, and the Germans seem to like the Americans tremendously. The wives of the American officers find the shopkeepers extremely amiable and delight in the shopping districts.

Aba Riva Kliot, Russian merchant exile.—America seems like heaven to me. Soviet Russia is hell.

Rear Admiral David W. Taylor, U. S. N.—While the submarine may be given offensive features to enable it to deal in some fashion with the surface vessel from beneath the surface, the submarine is essentially a vulnerable and, if I may so express it, a precarious type; is necessary today and probably will be for many years to come, but could not be relied upon as the main feature of a navy.

Lord Robert Cecil.—The biggest stumbling-block to acceptance of the League by the United States, I believe, is the question of six votes for the British Empire, but Great Britain cannot afford to quarrel with the dominions.

W. S. Kies.—The inequalities in the distribution of wealth stand out more strikingly in Europe than in America. For centuries the toiling masses have received, as their share in the distribution of wealth produced, nothing beyond the means for the barest existence. The few of the aristocracy, on the other hand, have not only grown wealthy, but have flaunted their wealth and have spent money wastefully and extravagantly. The war enabled the few to make enormous profits, and an example of riotous expenditure was given the masses of every country. A mass consciousness has begun to assert itself in Europe. The leaders of the people argue that the great masses fought the war, suffering and enduring its greatest hardships, and are entitled to more of the good things of life and to a standard of living beyond that which is necessary for mere existence. A solidarity and commonness of purpose is rapidly developing among leaders everywhere in Europe.

Solidarity of Purpose Developing Among European Leaders

Edwin T. Meredith.—It should be clear, I think, to everyone in the United States that unless the farmers receive adequate prices for what they produce there will not be a permanent agriculture in America, and without a permanent agriculture there can be no permanent prosperity anywhere in the land. The solution of the problem, therefore, is as much a matter of interest to the business man as it is to the farmer and the agencies which are working to improve and develop agriculture.

Sidney L. Gulick.—Japan's rising problems of feeding and satisfying her enormous and rapidly growing population of highly intelligent and extraordinarily active individuals are terrifying to contemplate. Already she has 2,688 people to every square mile of cultivatable land, and her people are increasing about 700,000 yearly. For many decades there will doubtless be unlimited opportunity for Japanese emigration to Manchuria and Siberia.

Joseph W. Rowe.—There are ample manifestations of growing public confidence in the Mexican Government. The people now show no hesitation in depositing money with banks, and several new banking institutions recently have been opened. The distrust which led the heirs of big estates representing very large values to refrain from registering their holdings under Carranza has disappeared, and these properties are being listed. The government income totals about 18,000,000 pesos a month, which is more than any former government ever received.

Confidence Grows, Mexicans Place Money in Banks

Leon Bourgeois.—There is an empty chair. It remains there empty. Never has it been removed. We have sat, eight of us, in the council meetings of the League. There has always been this ninth chair waiting for its occupant. That chair is America, and I would not allow it to be placed against the wall. The chair is silent, but it is there. One day we trust it will speak. We are like a family which has lost a son. But the chair is ready against his return, and we listen for the lifting of the latch, and his entry into the fold.

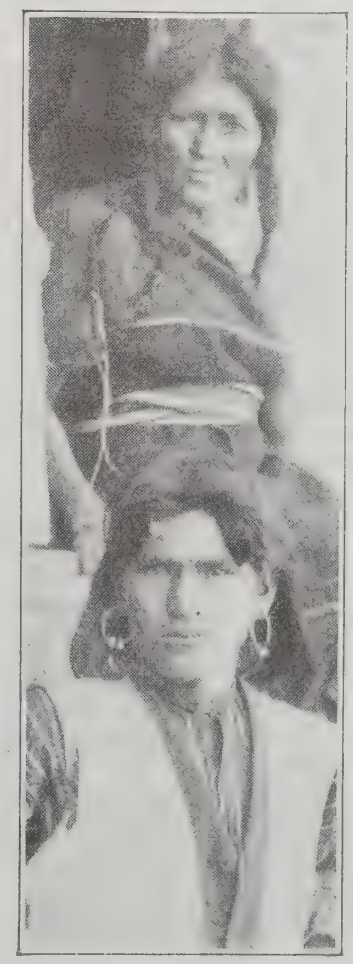
The Rev. Mr. Glenn Flynn.—Some men almost want to apologize for being good, while they will take it as a compliment if it is intimated that they are not living just as they should be.

LOOKING OVER THE ROOFS OF NEW MEXICAN PUEBLO.

Christmas in the Pueblos of the Aborigines

By H. G. TINSLEY

THE spirit of good will and festivity that characterizes millions of homes at this season is as much in evidence in the aboriginal pueblos in the Southwest as elsewhere. It is true that there is a wide difference between the customs and observances of Christmas in cities of the palefaces and in the quaint old towns of the American Indians. The Indians know nothing of Kriss Kringle and his pack of reindeer; they have no Christmas carols, no gifts of dolls and dressing gowns and fancy sewing baskets as are found in all well-regulated houses of white people. Lo and his family never tasted plum pudding or cranberry sauce, nor knew the delights of mince pie, and no black-eyed child of Lo ever saw a Christmas tree and shouted with joy at a fat, furry Santa Claus appearing mysteriously on the scene to distribute candy and toys. But, just the same, in their own way, the Pueblo Indians have Christmas delights not unworthy of communities which have lived in the sunshine of a waxing civilization for long centuries.



Pueblo girl in front of her parental home at Laguna, New Mexico.

The supreme idea among the red people in the pueblos is to forget grudges, be happy, and to have a feeling of fellowship for all mankind—and what more lovely idea may possess anyone? The Pueblo Indians have taken kindly to the teaching of the missionaries, who have been among them for more than 200 years. In some respects their abandonment of the pagan customs has spoken touchingly of their fidelity to the new religious belief. They observe a catalog of saints days in the church calendar, several with general demonstrations. But to them no day in the whole year compares with the glory of Christmas. Easter comes nearest.

The principal Indian pueblos in the territories are Laguna, San Juan and Isleta. There are a half-dozen others in New Mexico, but none has quite such unique phases of life or so intelligent a population as these mentioned. Laguna is the largest and oldest pueblo in Central New Mexico. It was seen by Coronado when he and his army marched to conquest in 1540. Its people have customs centuries old, and they live in stone houses—terraced, squat and crude affairs—that date back more than 200 years. The town is situated on the Santa Fe Railroad, about seventy miles west of Albuquerque, and is one of the picturesque points that eastern tourists watch to see. The Indians in Laguna are an agricultural race, and their zealous labors in their little grain fields among the foothills, and in their melon patches, and their industry among their flocks of sheep and goats awry popular notions concerning the perennial laziness of all Indian bucks.

The approach of Christmas is noted in Laguna weeks ahead. Everyone in the old aboriginal pueblo is alive to the importance of the season with what the Indians think is the very best kind of gaiety. The flocks are driven in from the mesa, the jerked beef is cut and hangs on lines everywhere drying in the warm sunshine, and the adobe granaries are overflowing with corn and beans. The women have ceased their weaving for the year.

The Indian boys now, after their long, hot summer season off among the sun-baked hills with the family goats and sheep, have an abundance of leisure, and may hunt for days at a time with the old household gun to seek a fat antelope, a brace of wild geese, and occasionally a mountain goat. Now the good housewives in the pueblo get ready for a grand season of baking and stewing preparatory to the whole week of feasting when the Christmas holiday comes. Brown bread is baked by scores of loaves, jars innumerable are filled with jam made from berries from the canyons, and the juiciest haunches of mountain goat or antelope (products of little Lo's prowess as a sportsman) are put away to dry, and be ready for roasting, on the last days before the holiday season arrives. The more thoughtful housewives in the pueblo provide bountifully with olla, a red drink made from zinfandel grapes, and a concoction of tizwin, or fermented juice of the cactus. Two days before Christmas the cedar chests in each home of the aristocratic Indians are opened and all the finery that the family has owned for generations is pompously brought forth. It is a memorable occasion in every home, and the black-eyed children stand about with open-eyed wonder. There are sprawling hats, trimmed with tinsel for children, bits of red and blue woolens for girls, dozens of beaded moccasins of several colors, necklaces of shells and agates, tortoise shell rattles, that are worn in the sacred dances, fancy buckskin leggins and black and red serapes for the women and gaudy sombreros and flaming sashes of wool for the men and youths. The last day of all before Christmas, the quaint little storehouses are swept, the baked and stewed provisions are set away in quantities enough for a small hotel, and all is ready for a week of merriment.

Typical of the Indian groups.

Christmas eve is ushered in amid a jangling of bells on the towers at the ancient adobe Franciscan mission church. Possibly a dozen shot guns may be fired in salute, and little Indian boys may cheer and yell. The aborigines know Christmas eve as *la Buena Noche*, and about all the events in the pueblo date from or before *la Buena Noche*. For untold generations it has been the custom to dance in the church on *la Buena Noche*. It is looked upon there as a pious duty to the Great Spirit. After the dance, mass, as prescribed by the church, takes place. Forty young men and women perform the dance. They are chosen by the chief of the pueblo, and no greater honor ever comes to anyone in Laguna than to be chosen for the dance on *la Buena Noche*. The good old padre at Laguna has tried several times to persuade the aborigines to abandon the dancing in the church. He has argued that it is impious and not like the customs of others in the same faith. But it has all been in vain. The Indians decline to give up this custom which was observed by their fathers ages before the missionaries came among them. Moreover, they do not see why, if dancing on the mesa at the harvest season is pleasing to the pagan rain gods, dancing in the church on the eve of the anniversary of the birth of the Son is not pleasing also to the *Tata Deas* that the missionaries have taught them about.

When the discordant bells are rung in the church tower on Christmas eve, every human being in Laguna who moves a step goes quickly to the church. It would be hard to find a stranger and more picturesque grouping of human beings. From the altar rail to the church doors the floor is crowded. A few curious Americans have come from the cattle ranches miles away; a sprinkle of cowboys are there in buckskin suits and great heavy boots from which monstrous spurs clank, and besides, a few Navajo Indians with cheeks streaked with vermillion and blue, raven hair down their backs and with gaudy serapes of wool across their big square shoulders. Not a word is spoken while the assemblage gathers; the faces of all but the children are impossibly stolid.

An old man with flowing white hair rises, and in the native language orders a space made down the center of the church for the ceremonies. Several young bucks force the spectators back and out of the building to make room, and the orchestra and singers start up. There is a hoarse drum made of dry sheepskin stretched over a half barrel. A squaw beats that. Four young men have stringed affairs made of mesquite wood, similar to very crude violins. These are scraped back and forth in the sole effort to make a noise in time with the drum beats. When a space ten feet wide has been forced by the officious and gesticulating bucks, at a signal the dancers come trooping from outdoors into the open space. That is always a grave moment. No bridal party was ever stared at and envied more than those twenty young bucks and twenty squaws all gorgeously decked for this occasion.

The men are bare to the waist, their chests and backs painted in a half-dozen startling colors; huge bracelets of silver and brass encircle the upper arms, their heavy shocks of hair hang to the shoulders, and their faces are a ghastly white. At the waist they wear embroidered kilts of red; yellowish leggins (calzoncillos) are fastened about their calves and beaded moccasins—generally the heirloom of the family for generations—are worn on their feet. Behind each kilt dangles the skin of a wildcat or a fox. Some of these decorations have been used in such dances for fully a century, a few for longer periods. Each male dancer holds a sacred gourd filled with pebbles, like a rattle, in one hand and a bunch of long eagle feathers in the other.

The dressing of the women dancers is more gaudy and generous. Each wears a bright red or blue overgown (the manta) from her shoulders to her knees. It is the product of weeks of labor and planning, with all its variegated embroidery. From the knees down

Strikes on the Farm

JUST when labor seems willing to go back to work in earnest the farmer makes ready to go on strike. There are several movements on foot to keep this year's wheat and corn crop off the market until prices regain what the farmer thinks is a fair level. At the same time the cotton growers of the South are organizing to cut down next year's acreage and bring the quotation up to the point which the farmers look upon as normal and necessary.

The movement in the South differs from that in the West and Northwest in that it gives promise of being more solidly organized. It appears to be backed by the leading newspapers, by business men, state officials and bankers. Nobody seems to question the propriety of the proceedings or to doubt that the plans proposed will be quite generally adopted.

At a meeting to be held in Memphis next week, at which the list of speakers will include such men as the governor of a Federal Reserve district, the governor of a state, the president of the American Cotton Association, the Secretary of Agriculture, bankers and a Senator or two, plans are to be laid for determining what percentage of the number of acres usually planted to cotton will be planted to other crops next year.

The *Commercial Appeal,* of Memphis, one of the great newspapers of the South, sums the arguments of that section up without any attempt at equivocation. It says editorially, "The present surplus of cotton and half a crop next year will about meet the demand. The cotton now picked is selling below cost. Why, then, rush into certain loss . . . .? There is going to be little credit for cotton growers next year. A big acreage will not be financed." The issue is thus clear cut and easily understood. Righteously or not, the South is planning to reduce the production of cotton in anticipation that the artificial shortage thus created will bring up prices. It is working on the same theory as that adopted by the corn and wheat growers of the West and Northwest, and if its plans seem more reprehensible it is only because they are stated more boldly and are backed by a more solidly organized movement.

No fair mind can feel that it is unnatural for the farmers, whether they raise corn, wheat or cotton, to be somewhat exasperated with the present trend of affairs in the world and domestic markets. The farmer sees his market fall but notices that this decrease is not passed on to the public. Wheat hits the toboggan, yet the price of bread stays up or, in some favorable instances, drops one, two or three cents a loaf. Cotton quotations fall far, far below the fat prices of war years, yet the cost of cotton goods does not decrease correspondingly. There is logic, therefore, in the farmer's argument that somebody who stands between the grower and the consumer must be making an unnatural profit.

One may, however, agree with the farmer in his belief that he has a very real grievance, without accepting the solution proposed as proper or even as a probable means of correcting a bad situation. The public will be the sufferer if the grower carries out his plans. Let the farmer make no mistake about that. And in time the increased price which the consumer pays for farm products will be handed back somehow to the farmer again in cases where the farmer is a consumer instead of a producer.

Before these farm strikes become settled realities, it might be well for those who are the leaders in the movements to consider the fact that this is not the first time men have tried to increase their profits by decreasing production and that there has never been an instance recorded where the experiment has been a lasting success.

Normalcy

"BACK to normalcy" has become the popular phrase of the day. Everybody subscribes to it because everybody interprets it to suit himself. The man who agrees with you on the desirability of attaining a state of normalcy may not agree with you at all on the location of that state. To you it may mean an opportunity to hire his labor for less money. To him it may merely mean a time when he will pay less for your products.

Normalcy is not a sheltered harbor where we can float blissfully at anchor, secure from the changing seas and winds of the world. One does not "go back" to normalcy. One goes forward. There is no going back. Civilization is ever advancing. The world is full of men and women who long for a return to some safe anchorage where they found life sweet and untroubled, but time, like a great river, sweeps us all relentlessly along, now plunging over great falls, now rushing through rock-torn rapids, again flowing peacefully between green woodlands warm and beautiful in the sunshine.

There is nothing absolute about normalcy. It is distinctly a relative condition. It may be one place today and another tomorrow. It is the average of all conditions, good, bad and indifferent, the real point in our existence which marks the sum of human progress. If we disturb the balance we must strike a new average and it is this process that is taking place today.

Too Busy

A LITTLE boy was looking out of the window at the starlit heavens pondering, perhaps, on the great world beyond.

"Mamma," he said suddenly, "will I go to heaven some day?"

"Yes, dear, if you are good."

"And will you be there?"

"I hope so. And papa too," she added.

The boy shook his head positively.

"No," he said, "papa won't be there. He couldn't leave the store."

There are thousands of men and women who are so engrossed with the one thing that they are doing that they think they are too busy for other things. They cannot "leave the store."

The business man wrapped up in the details of his schemes for acquiring money cannot afford time for anything else. He believes that the one goal to be reached is that of wealth, and while on the road to success he banishes all else from his mind. His family have all the money they need, a house, a car and the advantages of social position. Beyond a hurried dinner at night he rarely sees them, and his children are indeed strangers to him.

There is the woman who is too busy with her maze of social and club engagements to give much thought to her household. The care her children should receive she delegates to others, and the little ones grow up without the loving affection and solicitude of a mother who is too busy with other things to give them what is their right.

Thousands of men and women are so busy in their quest for pleasure and excitement as to exclude every other thought. That they could reach out a hand to help those who are less fortunate than they never enters their head. They have no time to take from the pursuit of pleasure "to look about and stretch a hand to a comrade quartered in no-luck land."

One of the great curses of present-day life is that everybody is "too busy," as Robert Burdette puts it, "to get away from the crowd for a while, and think, to stand at one side and let the world run by, while you get acquainted with yourself."

If you want to know what actual happiness is, to possess real peace of mind, to feel that contentment which satisfies, do not be so busy with the things that you are doing that you cannot give a little bit of your time at least to those things which enoble and enrich life.

Do not be too busy with the store.

France Should Learn

FRANCE is the most military nation in the history of the world. A history of France, with but a few added chapters, would be the history of world warfare.

It seems that France will never learn. The call of glory is in the nation's blood. Only French love of the trappings of military life could have led a nation to follow blindly a Napoleon and those before and after him. There has ever been a man ready to take advantage of the foolhardy valiance of France.

The lesson of military disaster seems to have no effect upon the French mind. Combined with a headlong diplomacy, this war spirit has led to French expeditions of failure that have dotted the earth—Montcalm in America, Napoleon in Egypt, Russia and at Waterloo, Soult and Massena in Spain, Leclerc in Haiti, Maximilian in Mexico, Napoleon III at Sedan.

Today France has more than 800,000 men under arms. She pleads the danger of future aggression on the part of Germany, that Germany which is no longer a military power in any sense, and hardly a political entity. Under cover of this plea, France is overrunning Europe, either with its armed forces or with those forerunners of armies, the French diplomats.

France fights the Soviets by backing Poland, but Poland quickly makes peace with the Bolsheviki. The military clique then turns to Wrangel only to witness his being driven out of Russia. Again France learns nothing. It forms the Little Entente, and does not fail to supply it with arms and assurance of support. A writer in THE DEARBORN INDEPENDENT recently declared that militarism is in the saddle in France. Militarism has always been in the saddle of France to its own sorrow and the grief of the world. Before the dim days of Caesar it was there, and remains so today.

It would be well for the people of the United States not to be blinded to this condition of a people. It was war on England, not love of liberty, that caused France to aid us in those days. France today backs Wrangel for the same reason. He is fighting an "enemy of France." That is all France wants. The spirit of war is in its bone and sinew and Millerand is only one of an almost endless line of leaders who have played upon this spirit and given it free rein.

We have been taught to look upon Germany as the personification of militarism, but that nation was but a big raw recruit, goose-stepping dazedly under machine leadership into battle, whereas the French child is swaddled in a military cloak, raised on military history and toys, attains manhood only in the military atmosphere, and hopes to die holding aloft a battle-torn tricolor and shouting, "Vive La France!" He seeks not to know the field or the cause that will bring that glory.

Such may be glorious, but it is pretty poor material for citizenship in the world today. We need work now, not war, and while no man can work better or harder than a Frenchman, what good can come of labor directed to such an end? France needs a prophet to tear away the falsity of glory, and to teach her that the time is soon to be here when the sword's only use will be to decorate the museums of history. As long as France loves war for war's sake her leaders will always be able to find some "menace" that will keep the country bristling with bayonets and echoing to the death-call of the bugle.

A Thought for the League

COMMENTING upon the debate at Geneva at which members of the League of Nations decided the time has not yet arrived to consider the problem of disarmament, one of the leading French journalists accuses the League of insincerity, and it must be admitted that his arguments have force.

To the mind of this French editor there is nothing to prohibit the nations of the world entering into an agreement to build no more super-dreadnoughts and to confine their navies to smaller and less expensive craft. Likewise, he says, there is no reason for continuing to build great siege guns and other monster cannon when light artillery is ample to take care of any internal or external police duty.

In 10 years the cost of the highest type of battleships has increased from less than seven million to forty million dollars. Consider then the costs of maintaining such a navy and try to justify the expenditures when all that is needed to obviate them is a simple agreement between the great powers that competitive fleet building shall cease.

Twenty-five per cent of the taxes raised by the United States this year have been devoted to military purposes. Almost sixty-eight per cent of these taxes have been spent on defraying the expenses of recent and previous wars. Only seven cents out of every dollar was used constructively by the government.

What is the reason that "the time has not arrived" to consider the reduction of world armaments?

Mr. Ford's Page

WHEN every theory of price reduction is weighed, there is one simple human truth that has more persistence and force than all of them, and it is this: price reduction must be started by those who can stand it best. Those who have benefited by high prices during the past three or four years must be the first to cut down. And this description includes most of the established manufacturing and selling class.

There is a way to pull down prices by pulling down wages, and it has this merit in the eyes of certain members of the business class, namely, that it enables them to make their adjustments without taking a loss.

Reduce the wages, they say, and thereby you will be reducing the cost of production, and by the time the accumulated stocks of goods produced on the old schedules are gone, the prices can gently descend into a lower position.

It is a very good theory, with this exception—it leaves out of account the great producing public who must somehow live during that period when abruptly lowered wages will have to meet a very slow decline in the cost of living. That is, it is a very good theory for the man with money, but it is cruelly hard on the man who depends on his wages.

Everyone knows that though money has been plentiful enough during the war period, and the people had a sense of well-being because of the inordinate rise in their receipts from labor, the gain was not always a real one. Many people who resisted the temptation to extravagance were able to save something, but many others—especially those who lived in cities and rented their homes—found that even "war wages" did not go much further round than the old wages did.

Besides that, there was the mental distress of seeing an apparent gain on one hand being taken away by a very serious increase in costs on the other hand. To earnest people there seemed to be a sort of mockery in it—the promise taken away almost as soon as given. Of course, every lure was held out to people to spend their money wastefully, and this took what the high cost of living had overlooked.

Now, the question arises: If adjustment will cause loss, as it certainly will, who ought to bear it? From a purely humane point of view, those who have the widest margin to turn around upon ought to bear it. People who have very narrow margins, or those who are just able to make both ends meet, ought not to be asked to bear the brunt of the burden.

There is no denying, however, that the lower level *could* be reached by a general reduction of wages, but it could only be reached at the cost of much distress—and there has been distress enough in the world since 1914.

Cutting wages is the easiest and most slovenly way to handle the situation, not to speak of its being an inhuman way. It is, in effect, throwing upon labor the incompetency of the managers of business. If we only knew it, the present situation is a challenge to every manufacturer to put more brains into his business problems, to overcome by management what other people try to overcome by wage reduction. Management in the use of materials and labor is an important factor in costs anyway; a poorly managed business costs much more to run than a well-managed business and, of course, it is the public that pays for the poorly run business.

So that is the challenge today. Make better commodities in a better way; by doing so you are able to give the public more for its money and the workman more for his work.

The time is here for managerial brains to illustrate by profitable feats its real value in the industrial system. Everyone who studies the times knows that the place which management occupies is not always acknowledged as it should be. Labor has made its place; management must make its place; and the way to do it is for management to assume the burden of adjusting industry to the needs of the time.

That, however, is a special problem. The main thing in most people's eyes is the money reward of labor—wages. To tamper with them before anything else is changed is to evade the real issue. And if the real issue is tackled first, reduction of wages may not be necessary, at least on the scale that some appear to be contemplating now.

The immediate practical point is that, in the process of adjustment, someone will have to take a loss. And who can take a loss except those who have something which they can afford to lose?

But the expression, "take a loss," is rather misleading. Really no loss is taken at all. It is only a giving up of a certain part of the profits. It is profit-sharing in a way that does not bring any advertisement or any praise for being a "philanthropist."

The other day a hardware merchant in a small town said a wise thing. He said, "I expect to take a loss of $10,000 on my stock last year. But, of course, you know, it isn't like really losing that much. We hardware men have had pretty good times. Most of my stock was bought at high prices, but I have already sold several stocks and had the benefit of it. Besides, the ten thousand dollars which I say that I will lose are not the same kind of dollars that I used to have. They are, in a way, speculative dollars. They are not the good old dollars that bought each 100 cents worth. So, though my loss may sound big, it is not big. And at the same time I am making it possible for the people in my town to go on building their houses without being discouraged by the size of the hardware item."

That was a wise merchant. He would rather take less profit and keep business moving, and keep his stock at high prices than prove a barrier to the progress of his community. A man like that is an asset to his town. He has a clear head. In the end he will not be the loser. He is better able to swing the adjustment that way, than by cutting down the wages of his tinsmiths and delivery men.

It is mighty poor business to keep on with anything that slows up business.

Just now the public is apprehensive. Winter is coming on and there have been rumors in the air. Everybody has become suddenly careful. The observers of business describe the condition as "a buyers' strike." The public is not spending its money as it did only recently.

What is the answer? Meet them half way. Make it worth their while to buy. The wholesalers have, in a measure, done their part. The banks also have shown commendable wisdom in the counsel they have given the smaller business men. But it is regrettable that the counsel of the banks has not been followed as readily as heretofore. When the banks give advice looking toward the increase of profits, they are very readily followed. Why not now, when their advice looks toward keeping business going on an even keel?

There is no intention here of laying any burdens on the man who is not able to bear them. But it behooves every business man to make a study of his concern and see how much more serviceably and economically he can manage it—not by the poor economy of making others pay, but by making an improved system pay the difference. This is going to be the test of business—better management in the production and distribution of commodities, which means business for the future.

If there is just a lurking desire to wait until after the Christmas trade—don't wait. Do it now. Your Christmas trade will be all the better for it. If the people "skip Christmas" this year, the "waiting until after Christmas" will prove to have been poor business.

MUCH of the talk about price reduction is merely a mental fumbling round for some excuse to postpone the reduction. There are no two ways about it: the way to reduce prices is to reduce them; and the ones to begin the reduction are the ones who began the increase. Leaders must lead the procession both ways, going up as well as coming down, or their leadership may be called in question. From a purely human point of view, the burden of any period of change ought to be borne by those most able to bear it. Losses always follow wrong economic conditions, just as gains accrue during wrong economic conditions; those must endure the one who have enjoyed the other. And it is not loss at that; it is wise investment.

ELEUTHERIOS VENIZELOS

European Portraits, 1920

By GEORGE F. KEARNEY

THE memories of a foreign newspaper correspondent soon become an interesting portrait gallery of conspicuous men. The little incidents attending his many interviews and those great moments in the lives of statesmen which it is a newspaperman's business to watch, become a fascinating personal history of Europe. People form an even truer picture of Europe today than ever before, for the tide of life runs rapidly, and the story of Europe is told less by the evolution of principles and more by the grim struggles of personalities.

For three months now I have been drifting throughout Europe asking questions of great leaders, watching the men on the floor of the House of Commons, living amid an odd collection of diplomats during the Spa Conference and pursuing elusive "Peace" conferences in bewildered Ireland. Just now they are assuming some order in my mind, for on leaving England for the Continent one sits back and says, "Now I am ready to hang my portraits in a special room labeled Modern Types, 1920, but, dear me, they are so many I hardly know where to begin and whom to eliminate!"

Certain men, however, must be hung conspicuously in this memory gallery. There is, of course, Lord Northcliffe, whom we shall meet in his luxurious lair in the *Times* office. Then there is Lloyd George, with his free and easy smile, whom naturally we shall see at many phases of today's history. About him it is necessary to place M. Millerand, the French prime minister, M. Delacroix, the Belgian prime minister, the distracted Herr Fehrenbrach, the German chief delegate to the Spa Conference, and several of Mr. Lloyd George's astute lieutenants. We must pay some attention to conspicuous English statesmen such as Lord Robert Cecil who figures so prominently in thoughtful English circles, to Mr. Asquith and his interesting wife, who is the greatest living exponent of "Margotism," to George Lansbury, the "doyen" of English radicals and the editor of the pro-Bolshevik Labor journal, the *Daily Herald*, and we should certainly watch closely those Radical leaders in the British Labor party and the rambunctious dissenters from their Evolutionary program.

(C) Underwood & Underwood

LORD NORTHCLIFFE

The dominating figure in all English thought is Lord Northcliffe. People continue to refer to him as the reincarnation of the Napoleonic mind. Indeed his army of editors, directing newspapers and magazines with immense circulations throughout all England, have all the appearances of the Napoleonic hordes. Individually, the Englishman is wearied of this strenuous character, but he has made and unmade prime ministers, and even today his thoughts are, curiously enough, the Englishman's thoughts with regard to their prime minister, Mr. Lloyd George. It is, again, simple when we realize that nearly every Englishman reads one of Lord Northcliffe's papers.

Lord Northcliffe is naturally a character worth studying. Innocently one enters his office in search of an interview. It is readily granted. He is a well-built, stocky, energetic man, extremely nervous but decisive in all his movements and speech. His face is complex, bearing all the lines of an intense thinker, and a man of great mental activity. It is the face of a vain man, arrogantly conscious of his power, yet sincere, kindly and sympathetic. His hair looks as though it were in perpetual need of combing and expresses a certain disorderliness about this overworked man.

An interviewer soon loses all illusions that he has come to receive answers to questions. Instead, this super-newspaper reporter wilfully turns the interviewer into the interviewed. For over an hour the world's most strenuous journalist plies questions on his bewildered victim, which reveals his amazing interest in the smallest details of American life. He is keen to know how this or that man in American public life is getting along, the legal status of Mary Pickford's marriage with Douglas Fairbanks, the details of newspaper mergers, the activities of the American Legion and the entrance of the ex-service man into American politics, the latest trend of the American motion picture industry, the results of recent municipal elections, and countless other points of interest. There are probably few men in America who know as much about American life as Lord Northcliffe, for he has traveled extensively throughout the country and has made it a point to study the newspapers in every chief American city. He is a very keen student of newspapers. He knows their origins, the history of their development and the men who have achieved success in journalism. In this he is like a great general who studies faithfully the tactics of the military men of the world.

At the end of the interview one retires in bewildered amazement at the sight of this great figure closing up his business for the day. One's last memory of Lord Northcliffe is of this strenuous man surrounded by three secretaries, glancing hastily over letters and signing them, O. K.'ing articles submitted for his approval and dictating instructions to his correspondents throughout the world. It would be very foolish to underestimate not only the power but the sincerity of this man. He has been wilfully spiteful, arrogant and overly self-confident, yet he grasps tightly the one essential principle in these days. He has insisted on the utmost accuracy in all his papers in the presentation of foreign news and the London *Times* goes far out of its way to express tolerantly and express candidly any difficult situation that arises in the relations between England and the world. Just this basis for a world policy, this understanding of the aspirations of the peoples of the world as distinguished from the interests of any one nation, just this intelligent sympathy with the tangle of national viewpoints in the world is a valuable contribution to world understanding.

Here is the substance of the interview which turned out to be a lesson in catechism: "I never allow a man to write an article for any of my papers," he said, "concerning America, or in fact any other nation, who has not been recently in that country and who has not a sympathetic appreciation of its national aims and life." It is interesting to note that Lord Northcliffe has a special American secretary, Mr. Louis Tracey, who remained in New York in the service of the British Information Bureau and every bit of American material reaching the Northcliffe papers is carefully scrutinized by this sincere student of American life.

By way of curious contrast, we shall now hammer at the door of George Lansbury in the office of his Labor newspaper, the *Daily Herald*, who has recently figured in the news as a recipient of Bolshevik gold for its pro-Bolshevik propaganda. Lansbury cannot see anything wrong with the Soviet form of government and the policy of his paper, which has a circulation of 300,000 and the support of a strong trade union element throughout Great Britain, is daily to hand out to its readers a very pleasant picture of England after a social revolution. At the Labor Conference we watched him make an impassioned plea for British Labor to join forces with the Third International meeting at Moscow which was dominated by Lenin. The burley Labor leaders applauded him roundly, for he is a very popular man among all the working people of England, but they voted overwhelmingly against committing themselves to the violence advocated by Lenin.

It is much easier to make an appointment with Lord Northcliffe than it is to arrange an interview with his most strenuous protagonist, Mr. Lansbury. Our cards are presented at the office of the *Herald* through a little hatchway behind which there peeped a red-headed office boy. He looked us over with great suspicion and finally consented to pass the cards on to the head office boy. In the meantime the hatchway was closed down and one heard the conference held on the other side of the partition. The hatchway opened again and the head office boy took a good look at us. He said nothing, then closed the hatchway and shuffled off on a mission. They were then passed on to another functionary and finally to Mr. Lansbury's secretary. The secretary did not deign to come out into the outer office, to mix with the proletariat, so the message is sent out to us that we must write out our request for an interview. Naturally, our curiosity was considerably heightened by the apparent inaccessibility of this very, very great prophet.

We stormed his citadel again, and lo! we were invited to luncheon. We waited nervously for the coming of the great man and occupied our time talking to a cockney gentleman with a very pleasant voice. This chap had just written a book, on Russia in fact, and he seemed to have a great deal of fun anticipating what his critics would say. Everybody seems to be writing a book on present-day Russia, so we wondered whether he was the famous Colonel Malone or a certain Mr. Keeling who had just returned from a Russian prison.

Then somebody said, "I say, Gawge—come along to lunch," and we realized that we had been tricked by his office force. We had been actually in the presence of George Lansbury.

Lansbury is one of those high-hearted idealists whom everybody in London declares is the last of the early Christians. He is a clever propagandist, unscrupulous in the pursuit of his ends, and curiously set in his ideas. On the other hand, he is a very lovable old gentleman, for he is earnest in his beliefs and devoted to the working out of principles which he does not consider dangerous. He occupies many positions, the most interesting one being that of mayor of the borough of Poplar in London where he has the adoration of a unanimous constituency. Contrasted with Lord Northcliffe he knows nothing, and cares less, about America. His newspaper is distinctly anti-American.

These two great figures in English journalism —Northcliffe and Lansbury—each wielding a terrific influence in the minds of the English people, are two instances of men who have stepped out of the original function of the journalistic profession and have used mediums, powerful in circulation, for the wilful domination of public opinion with their own views. In neither the *Daily Herald* nor the Northcliffe publications can one get an accurate picture of what is really going on in England. They are survivors of the old-time era of personal journalism in which the theories of the proprietor or editor seem of more concern than the actual truth of any situation.

We will reserve the story of Lloyd George until we display the rest of the pictures in our Spa Conference group. Let us pass on to the House of Commons and look down from the press gallery on the greatest men that England can produce. It is a great era in the history of personalities in England and the House is filled with remarkable men and brilliant speakers. We shall select the newer men first, but our mind will inevitably come back to that great towering statesman in English politics, Lord Robert Cecil.

One of the men who is making the most noise in the House of Commons today and seems to be forcing himself on the attention of the English people by his fondness for asking inconvenient questions is Lieutenant Commander Kenworthy. He is a young man with considerable force and a picturesque manner which inspires the interest of the English people in his future. He is endeavoring to express the ex-service man's viewpoint in the House of Commons and seems to be doing it remarkably well.

There is in contrast to him the pathetic figure of Colonel Cecil Estrange Malone, a pink and white complexioned youngster who was originally elected as a Coalition Liberal. His entry into the House of Commons occasioned considerable comment, for Colonel Malone is undoubtedly a brilliant young man.

Then something happened. He was one of the first M. P.'s to journey through Russia and he came back, after his brief stay, thoroughly converted to the Bolshevik idea. In the fiery expression of his opinions he became unmanageable in his own party, and we saw him at the Labor party convention at Scarborough being booed out of the party for his lack of respect of their proposals. He then hopped into the British Socialist party where he was received with the tolerance they accord to a young "careerist." Resenting this, his next jump was into the real Communist party of Great Britain and even these wild radicals find some difficulty in preventing a further hop left on the part of the strenuous Colonel Malone.

In the meantime his peaceful little constituency in a quiet country district looks with dismay on their representative whom they elected on a platform of "Kill the Kaiser, Prevent Bolshevism, and Make Germany Pay." He is not in the least alarmed by these solemn warnings of his constituency, and when told that he had not the slightest chance of being returned to the House of Commons he declared:

"When next I come to Parliament I hope it will be behind a Red army that will seize Whitehall and end forever this reign of Parliamentary ineffectualness."

Should we mention in passing Horatio Bottomley, M. P., before we discard his photograph as one unworthy of real consideration? Bottomley is a conspicuous example of the practical outcome of "dictatorship of the proletariat." He knows exactly what the ignorant people want and gives it to them in his *John Bull*. He feeds their prejudices, their lust for scandal and is a troublesome, although powerful, figure in British public life. As a man he is big, oily and fat with the cynical smile of a race track frequenter.

In striking contrast to this there is that great political figure, Lord Robert Cecil, whose influence is incalculable on the thought of the country. Lord Robert is a member of the famous Cecil family who have long been the traditional leaders of English political thought. The Cecils have always been a bit beyond their own time, and they have functioned in the history of English political thought as clear-headed prophets rather than as active statesmen. Lord Robert held but one position with the government, and resigned over some apparently small question of church policy. He seems to have functioned best, so far, as an academic student of politics. When Lord Robert talks, his speeches are invariably quoted in full in all the newspapers. They are always worthy of the attention they receive. In that sad period of the history of the League of Nations when the Russian-Polish question proved the ineffectualness of the League in great political questions, Lord Robert's criticism that "There cannot exist two international bodies—the council of the League of Nations and a supreme council in Europe —at one time" is the most strikingly true analysis of the situation. He has been the strong conservative advocate of an established policy on the part of the British Government toward Labor, and is well considered by his Labor opponents as a man of rare honesty and honor. His phrase, "If Bolshevism can be considered the scarlet fever of civilization certainly it can be said that England is suffering from a sympathetic sore throat," is now echoing through Europe.

"BOB CECIL"
—From a cartoon by Bert Thomas

He is a great advocate of a League of Nations as the only solution for Europe's difficulties, and the practical means for saving the British Empire. As its strongest friend he is its greatest critic but he never allows his disappointment for the present League to destroy his faith in a League that will function properly. Lord Robert is a tall man, very thin; more Hamlet is he than the Dane and one can but wish that he would one day cry out in dismay on the floor of the House, "Oh cursed spite that I was born to set this world aright." In these days he is frequently mentioned as the successor to Lloyd George as prime minister of England, but the Englishman shakes his head and tells you that the Cecils best perform their function when they remain aloof from practical political affairs.

Another interesting figure is, of course, Mr. Asquith, who has been returned to the House of Commons and is becoming the chief critic of the Coalition Government. His hair is a bit whiter than in the old days before the war and he shows plainly the weariness of his fateful career during the first part of the war.

Just now the interest centers mostly in his wife, Margot Tennant Asquith, who has written an amazingly frank autobiography in which she has discussed with appalling candidness her old friends among that famous sect the "Souls" which played so important a part in the recent history of England. She has known seven British prime ministers intimately and in this book she has discussed them with great frankness.

Most English mothers consider "Margotism" a menace to the younger generation. The young ladies of English society today are endeavoring to ape the inimitable Mrs. Asquith in the balderdash methods of her love making which she so frankly describes. Her book has given rise to considerable confusion among the clubs of the West End, for society "buds," of the past and present, are threatening to write similarly frank stories of their lives.

It is needless to say that Mr. Asquith adores this unusually stimulating wife and the little ceremonies that are exchanged between them are of real interest to the English people. At exactly half past one they may be seen dining together in their home at 44 Bedford Square. Many people make it a point to pass by this place each day at this time to see this remarkable couple at luncheon. When they are finished Mr. Asquith conducts her to the door of her motor and he stands, with the wind tostling his white hair, until the automobile turns the corner. We get a quaint insight into the charm that still prevails in English life expressed in these little courtesies exchanged between two remarkable figures in the history of modern England.

Certainly the most interesting men figuring in the newspapers of today are the leaders of the British Labor party. We journeyed up to Scarborough and watched them in action at their annual convention. One is not impressed with the intellectual leadership of this party, but naturally there are a number of very fiery leaders.

We were, of course, impressed by the remarkable partnership of Sidney and Beatrice Webb, who function so readily as two great storehouses of information for the Labor party. They are a most amazing pair. Mr. Webb is a short, rather stout man, Prussian in appearance, with the full beard of a Frenchman, the bronzed appearance of a Scandinavian and the calm face of a Hollander. Of this pair Bernard Shaw has said, "They are the ablest couple in England, and the accident of their marrying one another was so impossible as a mere piece of luck that it has restored faith in Providence to a Darwinized world." In this article in which he reviews their book on "A Constitution for the Socialist Commonwealth of Great Britain," he blandly asks: "I wonder how many eons will elapse before some historian startles England by a gorgeous rhetorical passage on the happiness of the twentieth century in enjoying the counsels of that extraordinary partnership known as Sidney and Beatrice Webb. Will nobody write a festival play entitled 'The Fortunate Marriage' to celebrate the golden wedding of this amazing pair?"

Mr. Webb is very spry and we watched them taking long walks on the sands together, hand in hand, and *always in step*. Sidney Webb sat on the platform with the secretariat of the Labor party during the convention while Mrs. Webb sat back in the shadow of her husband. Frequently Sidney turned to Beatrice with a know-

The Scope of Jewish Dictatorship in the U. S.

Money, Men, Materials; Wages and Prices; All Placed in the Hands of Jews by President Whom Many Believe Played "A Lone Hand."

THE common criticism made against President Wilson that "he played a lone hand" and would not avail himself of advice, can be made only by those who are in ignorance of the Jewish government which continually advised the President on all matters.

While the President is supposed to have been extremely jealous of his authority, this view of him can be maintained only by remaining blind to the immense authority he conferred on the members of the Jewish War Government. It is true he did not take Congress into his confidence; it is true that he made little of the members of his Cabinet; it is also true that he ignored the constitutional place of the United States Senate in the advisory work of making treaties; but it is not true that he acted without advice; it is not true that he depended on his own mind in the conduct of the war and the negotiations at Versailles.

Just when Bernard M. Baruch, the Jewish high governor of the United States in war affairs, came to know Mr. Wilson is yet to be told; but just when he got into and out of the war are matters about which he himself has told us. He got into the war at Plattsburg, two years before there was a war; and he got out of the war when the business at Paris was ended.

"I came back on the *George Washington*," he testified, which means that he remained at Paris until the last detail was arranged.

It is said that Mr. Baruch was normally a Republican until Woodrow Wilson began to loom up as a presidential possibility. The Jews made much of Woodrow Wilson, far too much for his own good. They formed a solid ring around him. There was a time when he communicated to the country through no one but a Jew. The best political writers in the country were sidetracked for two years because the President chose the Jewish journalist, David Lawrence, as his unofficial mouthpiece. Lawrence had the run of the White House offices, with frequent access to the President, and for a time he was the high cockalorum of national newspaperdom, but neither that privilege nor the assiduous boosting of the Jewish ring availed to make him a favorite with the American public.

Why the Jews Changed Party Front

AMERICAN Jewry was Democratic until it had secured the last favor that Woodrow Wilson could give, and then it left the Democratic party as with the indecent haste of rats leaving a sinking ship. Baruch staid rather ostentatiously spending his money for motion picture appeals in favor of the League of Nations, but it is entirely probable that he has a genuine interest in the new administration.

For one thing, there may be investigations. It remains to be seen whether the investigations which the Republican majority in the House began to make with regard to war expenditures will be continued. There are those who profess to believe that they will not be continued, the explanation being that such investigation as was made before election was solely for the purpose of securing campaign data, or creating a political atmosphere unfavorable to the Democrats.

It is sincerely to be hoped that the Republicans will not rest under that imputation, but that they will rigorously pursue the investigations that have been begun. There are two reasons why this should be done; first, that the country may know, with a view to future contingencies, what was "put over" on the government during the war; second, that the full sweep of Jewish influence in this country may be exposed. The second reason is not expected to appear very weighty to practical politicians, and that is no matter, for if the first reason is deemed sufficient, and if the investigations are honestly made, then inevitably the Jewish power will be further exposed. It is linked up at every stage of the business.

This may have had something to do with the sudden desertion of the Democratic party by the Jews. They may have swung over in order to have something to say about the pursuit of further investigations. Already the counsel is being heard, "Let bygones be bygones," "The people are tired of investigations, and don't want any more"; already attempts are being made to introduce fresher issues to deflect the public mind from war affairs, and the attempts are doubtless Jewish in their origin.

That portion of the public who are awake to the Jewish Question will do well to observe with care the attitude of the new administration toward completing the investigations. The Jews did not flock to the Republicans for nothing. The country is entitled to know what was done with the fabulous amounts of money spent during the war. The people are entitled to know who were their masters, and who were responsible for certain strange situations which were created.

Members of the House, Senators, and other officials should, at the very least, pay particular attention to the directions from which influences against further inquiry come.

Now, as to Mr. Bernard M. Baruch, who for some as yet undefined reason was made head and front of the United States at war, we have his own word on several occasions that he was the most important man in the war.

"I probably had more power than perhaps any other man did in the war; doubtless that is true," he told Representative Jefferis.

And again: "We had the power of priority, which was the greatest power in the war . . . . Exactly; there is no question about that. I assumed that responsibility, sir, and that final determination rested within me."

And when Representative Jefferis said "What?" to that startling statement, Mr. Baruch repeated it:

"That final determination, as the President said, rested within me."

Representative Graham said to him: "In other words, I am right about this, Mr. Baruch, that yours was the guiding mind . . . ."

And Mr. Baruch replied: "That is partly correct—I think you are entirely correct . . . ."

The Scope of Baruch's War Power

NOW, in what did Baruch's power consist? Briefly, in this—in the dictatorship of the United States. He once expressed the opinion that the United States could have been managed that way in time of peace, but he explained that it was easier in war time, was made easy because of the patriotic mood of the people.

It is not sufficient, however, to say that Mr. Baruch's rule constituted a dictatorship of the United States; it remains to be shown just how rigid and far-reaching that dictatorship was. The reader may recognize at what point the Jewish rule touched his affairs also.

Mr. Baruch, who had the "final determination" of everything, says that his power extended to the needs of the Army and Navy, the Shipping Board, the Railroad Administration, touched also the Food and Fuel Administrations, and besides all that had a vital control of the Allies' purchases not only in the United States, but also in other countries with reference to certain materials.

There were $30,000,000,000 (Thirty Billions of dollars) spent by the United States Government during the war, all of it raised by taxation and bonds. Of this sum, $10,000,000,000 (Ten Billions) was loaned to the Allies and spent here—all of the purchases being viséed under Mr. Baruch's authority.

As told by himself, his power consisted in the following authorities:

1. **Authority over the use of capital in the private business of Americans.**

This authority was nominally under the Capital Issues Committee, the controlling factor of which was another Jew, Eugene Meyer, Jr. Here is another inexplicable circumstance. Was he the only banker in the United States capable of exercising a dominant influence? Why did it happen that a Jew should be found in this important position too? Is it only accident? Was there no design involved?

Well, it was necessary during the war for anyone wishing to use capital in business enterprise, to lay all his cards on the table. He was required to reveal his plans, his ground for expecting success—in brief, tell the Jewish rulers and their Jewish representatives all that he would tell in confidence to his banker in negotiating a loan. The organization which a few Jews perfected was the most complete business inquisition ever set up in any country. And that the knowledge thus gained should always be sacredly guarded, or always honestly used, would be expecting too much of human nature.

Having the "Say So" Over Gentile Business

MR. BARUCH gave some instances of this, though they were not the instances that are calculated to throw the most light on the inner workings of the organization. He said:

"The capital issues committee (*where Mr. Meyer reigned*), in the Treasury Department, had a man who sat with the War Industries Board (*where Mr. Baruch reigned*), and who always came to the War Industries Board to find out whether the individual or the corporation who wanted this money was going to use it for the purpose to win the war. To cite a case that happened at Philadelphia, that city wanted to make extensive public improvements; New York City wanted to spend $8,000,000 for schools, which would take an enormous amount of steel, labor, materials and transportation. We said, 'No, that won't help win the war. You can postpone that until later on. We cannot spare the steel on all these various things.'"

Very well. Does Mr. Baruch know of an enormous theater which a Jewish theatrical owner was permitted to build in an eastern city during the war?

Did he ever hear of non-Jews being refused permission to go ahead in a legitimate business which would have helped produce war materials, and that afterward—afterward—on almost identically the same plans, and in the same locality, a Jewish concern was given permission to do that very thing?

This was a terrible power, and far too great to be vested in one man; certainly it was such a power as should never have been vested in a coterié of Jews. The puzzle of it becomes greater the deeper it is probed. How did it occur? How *could* it occur—that always, at the most critical and delicate points in these matters, there sat a Jew enthroned with autocratic power?

Well could Mr. Baruch say—"I had more power than any man in the war." He could even have said: "We Jews had more power than you Americans did in the war"—and it would have been true.

2. **Authority over all materials.**

This, of course, included everything. Mr. Baruch was an expert in many of the lines of material involved, and had held interests in many of them. What the investigators endeavored to learn was in how many lines he was interested during the war.

In lines where Mr. Baruch was not expert he, of course, had experts in charge. There was Mr. Julius Rosenwald, another Jew, who was in charge of "supplies (including clothing)" and who had a Mr. Eisenman to represent him. Mr. Eisenman was on the stand for a considerable period with regard to uniforms, the change made in their quality, the price paid to the manufacturers (mostly Jewish) and other interesting questions.

The great Guggenheim copper interests, who sold most of the copper used during the war, was represented by a former employe; but undoubtedly Mr. Baruch himself, who was much interested in copper during his business career, was the principal expert in that line.

Every Line of Industry in His Hand

IT IS impossible to escape the names of Jews all down the line in these most important departments. But, for the present, attention is called to the scope of Mr. Baruch's control in the country at large. It is best stated in his own words:

"No building costing more than $2,500 could be erected in the United States without the approval of the War Industries Board. Nobody could get a barrel of cement without its approval. You could not get a piece of zinc for your kitchen table without the approval of the War Industries Board."

3. **Authority over industries.**

He determined where coal might be shipped, where steel might be sold, where industries might be operated, and where not. With the control over capital needed in business, went also control of the materials needed in industry. This control over industry was exercised through the device called priorities, which Mr. Baruch rightly described as "the greatest power in the war." He was the most powerful man in the war, because he exercised this power.

Mr. Baruch said that there were 351 or 357 lines of industry under his control in the United States, including "practically every raw material in the world."

"I had the final authority," he said. Whether it was sugar or silk, coal or cannon, Mr. Baruch ruled its movements.

Mr. Jefferis—"For instance, this priority that you had would decide whether civilians should have any commodities for building?"

Mr. Baruch—"Yes; if we had not had that priority committee the civilians would have had nothing."

Mr. Jefferis—"Did they get anything?"

Mr. Baruch—"They got all there was."

Mr. Jefferis—"Did you sit with these priority boards at any time, or not?"

Mr. Baruch—"Sometimes; not very frequently. I was ex-officio of every one of the committees, and made it my business to go around as far as I could and keep in touch with everything."

Mr. Jefferis—"And all these different lines, really, ultimately, centered in you, so far as power was concerned?"

Mr. Baruch—"Yes, sir, it did. I probably had more power than perhaps any other man did in the war: doubtless that is true."

That, however, was not the full extent of Mr. Baruch's control over industry. The heart of industry is Power. Mr. Baruch controlled the Power of the United States. The dream of the Power Trust, an evil dream for this country, was realized for the first time under the organization which this single individual formed. He says:

"Not only did we endeavor to control the raw materials, but as well the manufacturing facilities of the country. We established priority uses also for power . . . ."

4. **Authority over the classes of men to be called to military service.**

Baruch pointed out, virtually pointed out to the Provost Marshal of the United States, the classes of men to be taken into the army. "We had to decide virtually the necessity of such things," he said. "We decided that the less essential industries would have to be curbed, and it was from them that man power would have to be taken for the Army." In this way he ruled chauffeurs, traveling salesmen, and similar classes into military service. It was, of course, necessary that some such ruling should be made, but why one man, why always this one man?

5. **Authority over the personnel of labor in this country.**

"We decided upon a dilution of men with women labor, which was a thing that had always been fought by the labor unions."

Making Costs Eat Up the Income

6. And now behold as complete an illustration of one part of the Protocols as ever could be found in any Gentile government. Readers of previous articles will remember the passage:

> *"We will force up wages* which, however, *will be of no benefit to the workers,* for we will at the same time *cause a rise in the prices of necessities."*

Mr. Baruch at one time was inclined to sidestep the matter of fixing wages; he did not like the expression. But that the reader himself may decide, we quote the testimony in full:

Mr. Jefferis—"Did the War Industries Board fix the price of labor?"

Mr. Baruch—"If you can call it that way, but I would not say so; no, sir."

Mr. Jefferis—"I am trying to get at what you did."

Mr. Baruch—"No, sir; we did not fix the price of wages."

Mr. Jefferis—"What did you do?"

Mr. Baruch—"Just what I told you."

Mr. Jefferis—"Probably I am a little dense, but I did not catch it if you told me."

Mr. Baruch—"When the price-fixing committee fixed the price of steel, we will say, they said, 'This price is agreed upon, and you shall keep wages where they are'—and those were the wages that were prevailing at the price we fixed. At the time prices were fixed at first they were very much higher than the prices that we fixed."

Mr. Jefferis—"When you got the price of any of these low materials you would fix the price of labor that was to be employed in producing them?"

Mr. Baruch—"To the extent that it should remain at the maximum of what it was when we fixed the price."

Considering the weight of Mr. Baruch's authority, and the stipulations he made, this was to all intents and purposes a fixing of the rate of wages.

Jewish Dictatorship in Full Flush

NOW, as to the fixing of prices, Mr. Baruch is much more positive. In answer to a question by Mr. Garrett, Mr. Baruch said:

> *"We fixed the prices* in co-operation with the industries, but *when we fixed a price we fixed it for the total production,* not alone for the army and the navy, but for the Allies and *the civilian population."*

The minutes of one of the meetings of Mr. Baruch's board shows this:

> "Commissioner Baruch directed that the minutes show that the commission had consumed the entire afternoon in a discussion of *price-fixing, particularly with reference to the control of the food supply, grain, cotton, wool,* and raw materials generally."

Mr. Graham—"Tell me something else: How much personal attention did you give to the matter of price-fixing?"

Mr. Baruch—"In the beginning, considerable . . . ."

At another time Mr. Baruch said—*"There was no law at all in the land to fix prices."*

Mr. Jefferis—"We grant that, *but you did it."*

Mr. Baruch—*"Yes, we did it,* and we did a great many things in the stress of the times."

Here was one man, having supreme dictatorial power, at both ends of the common people's affairs.

He admits that of the 351 or 357 lines of essential industry which he controlled, he fixed the prices at which the commodities should be sold to the government and to civilians. In fixing the prices, however, he made wage stipulations. The matter of wages came first—it entered into Mr. Baruch's computation of the cost, on which, to a certain extent, he based the price. Then, having decided what the producer was to receive in wages, he decided next what the producer should pay for living. The producer himself may answer the question as to how it all turned out! Wages were "high," but not quite so high as "living"; and the answer to both is in the testimony of Barney Baruch.

That is not the whole story by any means. It is inserted here merely to find its place in the list of authorities conferred on Mr. Baruch.

How completely Baruch felt himself to be the "power" is shown by a passage which occurred when he was trying to explain the very large profits made by some concerns with which he did business.

Mr. Jefferis—"Then the system which you did adopt did not give the Lukens Steel & Iron Company the amount of profit that the low-producing companies had?"

Mr. Baruch—"No, but we took 80 per cent away from the others."

Mr. Jefferis—"The law did that, didn't it?"

Mr. Baruch—"Yes; the law did that."

Mr. Graham—"What did you mean by the use of the word 'we'?"

Mr. Baruch—"The government did that. Excuse me, but I meant we, the Congress."

Mr. Graham—"You meant that the Congress passed a law covering that?"

Mr. Baruch—"Yes, sir."

A Merited Rebuke

Mr. Graham—"Did you have anything to do with that?"

Mr. Baruch—"Not a thing."

Mr. Graham—"Then I would not use the word 'we' if I were you."

Whether Mr. Baruch slipped up there, he best knows. Just as he had power to give the workers wages, and take it away again by price-fixing, so he had power to allow the raw material corporations to make fabulous profits—and it would not be at all unthinkable that he also had something to do with taking part of it away again. He said once, "We took away 80 per cent"; then he confessed it was a slip. Of the tongue, or of his prudence?

Certainly, the profits he allowed were so large that even where the 80 per cent was paid back—where it *was* paid back (there were all kinds of evasions and frauds)—the profits were still enormous.

And 73 per cent of the "war millionaires" of New York, in spite of the 80 per cent, are Jews.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Mayor Hylan, of New York, has recently vetoed a measure which would allow Jewish teachers in the public schools to absent themselves on Jewish holidays without loss of pay. This is to be remembered in connection with the efforts of Mr. Untermeyer to implicate Mayor Hylan in the building contract frauds.

England's new peeress, Jose Collins, who was recently married to an earl, had a Jewish mother, Lottie Collins, of "Tarara-boom-de-ay" fame.

In response to the attack made upon the Polish Government by Jewish deputies, the minister of war defended the "secret orders" issued by his office by saying that they had been previously submitted to Mr. Henry Morgenthau, and had been approved by him.

The Free City of Danzig has required a five-year residence to precede full citizenship. This is the identical requirement made by the United States. But the Jews have laid complaint before the League of Nations against the city of Danzig.

Foreign observers know more about what is occurring in the United States than do many Americans. The Amsterdam *Handelsblad* has an article describing the Bolshevik Sunday Schools in American cities. The government, of course, has known of them from the first. There are Young Men's Communist Associations (the Bolshevist Y. M. C. A. in America); there are also Young People's Societies of Communistic Endeavor (the Y. P. S. C. E. of Bolshevism). That is, the evangelistic and educational machinery of the church is parodied at almost every point.

The intelligent Jews of the United States are extremely displeased with Rabbi Wise's attack on THE DEARBORN INDEPENDENT. "It furnishes a stronger weapon against the Jews," says one writer, "than ten Jewish congresses could give." The judgment on Rabbi Wise is not at all surprising; indeed the intellectual bankruptcy of the Jewish rabbinate has been terribly exposed by the attempted substitution of abuse for refutation. But why admit that regular Jewish congresses also are dangerous things for the Gentiles to know about?

Thanks to Jewish influence at Washington, Leo Keena, a Jew, has replaced Mr. Rankin as American Consul General at Warsaw. Keena says he is ready to visé 1,000 passports a day if necessary. His predecessor apparently did not visé Jewish passports rapidly enough to suit Mr. Warburg and Mr. Baruch.

Regarding the Hungarian situation, Bishop Prohazka says: "Anti-Semitism, as such, does not exist in Hungary. Our anti-Semitism is such as bids us look upon the Jew as an essential portion of the nation, but to prevent him gaining a preponderance over us. We are not faced by the problem of anti-Semitism, but by that of racial self-defense. Our attitude of defense must not be looked upon by the Jews as a matter of hatred. Merely for the sake of liberalism we must not suffer that half the lawyers and the majority of the medical men in the country be Jews."

The Jews are just now very much aroused against the Presbyterian church and the American Red Cross: against the former because it has appointed a missionary to the Jews; against the latter because it maintains a Jewish section of the Foreign Language Information Service. As both the Presbyterian church and the Red Cross are non-Jewish institutions, this opposition could always have been assumed without the necessity of the present outbreak to confirm it.

Pressure is already being brought to bear on President-elect Harding to swing him completely over to the service of Jewish aims. What neither the Irish nor the Poles would have the temerity to do, the Jews are demanding as a right. Mr. Harding, however, has the example of the Wilson administration before him as a warning.

The Chicago *Sentinel,* a Jewish publication, describes the recreation centers which are established in swarming ghettos for the use of Jewish children, by the lovely name of "missionary holes."

Jacob Billikopf was personal secretary to Jacob H. Schiff. Like many others, Mr. Billikopf is giving his reminiscences of the great Jew financier. After one story, Mr. Billikopf adds: "Thus spoke the man who was *powerful enough to drive the mightiest of the earth to despair and to ruin a whole country by uttering one word*—thus spoke Jacob H. Schiff."

In Poland, where the Jews claim they are "persecuted," the Polish War Ministry has created the office of Chief Rabbi with the military forces.

The exception which is made in favor of Jews by the prohibition laws has been so widely abused that the authorities have taken notice of it. The Commissioner of Internal Revenue has issued new instructions on the matter. The complaints that are made usually implicate rabbis and wine-dealers. Usually the wine-selling is a monopoly, and the monopolist, of course, is a Jew. Recently a Jewish paper complained because a Jewish comedian was springing a joke on the stage, whose point was the rabbinical discretion in the issuance of wine permits. In St. Louis Missouri, the permit of the Jewish wine monopolist was cancelled. He was the son of the rabbi. The Reform rabbis are said to be willing to use a grape juice substitute for religious purposes.

Charlie Chaplin is an English Jew. The Jewish papers are having a little fun among themselves over the divorce of Charlie from his wife, who is also a Jewess. One of the complaints was that when Mrs. Chaplin arranged a "Christmas tree," Charlie would not come home to see it. Of course not! Why should he? Christmas is a time to trade with Gentiles!

Marcus Blankenburg, High Commissioner for the South African Union in London, is a prominent Jew.

A. Decker, Warsaw correspondent for the Chicago *Daily News,* recently wrote that the American Joint Distribution Commission is spending money to encourage Jewish immigration to the United States. This, of course, greatly stirred the Jewish press here. Decker was writing "anti-Semitism"! It was suggested that influential Jews see Victor Lawson, who owns the paper, and have Decker discharged. But Decker is not the only person in possession of the facts. There is more going on in this emigration matter than the Jews want anyone to know.

Lord Sydenham has made a statement showing that the recent coal miners' strike in England was the work of Jewish agitators. It is a noticeable fact that all the industries at present attacked by the disorderly elements of English labor are Gentile industries. No great strike has ever been brought against Jew-controlled industries anywhere. The reason is that the fomenters of industrial disorder are Jews under strict Jewish control.

Victor Young, the talented violinist, who recently made a successful debut in America, has a romantic history. He was the son of a Jewish tailor and was caught in the revolutionary upheaval in Russia until a few months ago.

Fill New Niches in Gallery of "Immortals"

FROM earliest times it has been the custom of nations to honor their illustrious dead. Some countries have done it in one way, some in another. The Greeks and Romans loved to enshrine their dead in marble, and marble statues of many of the greatest among the ancients are still in existence.

France elects its most distinguished living men to its Academy, where they are termed "Immortals."

Only within recent years has America come to a realization of its wealth of illustrious men; and it was in 1900 that the Hall of Fame of New York University was founded.

Built on a bluff overlooking the Harlem River, and across from the north end of Manhattan Island, it commands a noble, panoramic view. Elections to the Hall of Fame are held every five years. The first was held in 1900; the result of the fifth has just been made public. For these various elections, nominations are invited from the public at large, and more than sixty of the available one hundred and fifty spaces have now been filled.

Names of nominees are first passed upon by groups of well-known Americans, and the names finally approved are then submitted for vote to one hundred men and women, whose decision is final. As a matter of fact, the present electorate of the Hall of Fame consists of ninety-six men and six women—102 in all.

In the election just closed the electors belonged in various walks of life as follows:

University presidents, 27; professors of history and historians, 18; scientists, 11; authors and editors, 14; public officials and men and women of affairs, 19; justices, national and state courts, 12. There is one omitted here, by reason of the fact that one elector cast a blank ballot.

Among immortals already elected are such eminent American writers as Emerson, the sage of Concord; the poet Longfellow; Washington Irving, Hawthorne, Bryant, Bancroft, Fenimore Cooper, Oliver Wendell Holmes, Edgar Allan Poe, John L. Motley, Harriet Beecher Stowe, and others.

Among American inventors are Robert Fulton, Samuel Morse, Eli Whitney and Elias Howe. Naval and military heroes are represented by Farragut, Grant, Lee and Sherman. Among educators is Horace Mann.

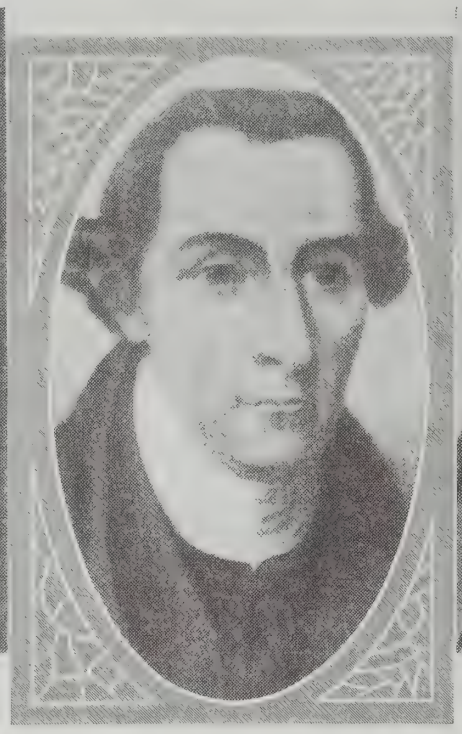
In all, fifty men and six women have been honored; authors, statesmen, preachers, explorers (Daniel Boone is the only one under this heading), scientists, musicians, soldiers and sailors, inventors and educators. The six women are Harriet Beecher Stowe, author of "Uncle Tom's Cabin," Mary Lyon and Emma Willard, educators and missionaries, Maria Mitchell, scientist, Frances E. Willard, home and social worker, and Charlotte S. Clushman, artist.

At the election just held the following six men won their places among the Immortals:

Samuel Langhorne Clemens (Mark Twain), James Buchanan Eads, Patrick Henry, William Thomas Green Morton, Augustus St. Gaudens and Roger Williams.

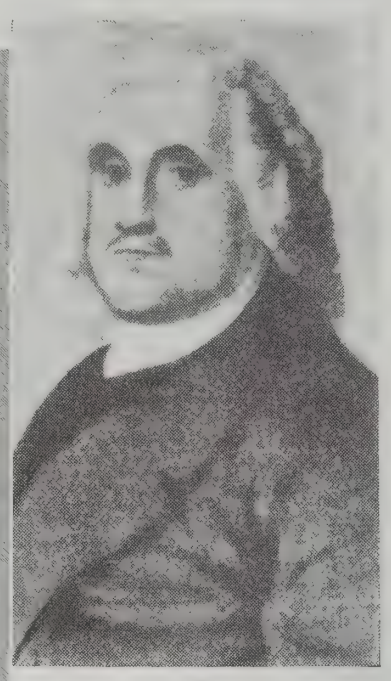
Twenty-seven women were nominated, but Alice Freeman Palmer was the only successful one.

Strange to say, many men and women of fame and distinction were nominated but did not receive enough votes to elect them. Among these were Walt Whitman, Henry M. Stanley of "Darkest Africa" fame, Grover Cleveland, Pocahontas, Rolfe, Martha Washington, John Paul Jones, Edwin Booth, and a few others. But their opportunity will, of course, come again.



Official biographies of the new Immortals, seven in all, prepared by the university, were published when the results of the election were made public. They are as follows:

MARK TWAIN.—Samuel Langhorne Clemens, American humorist, is more generally known by his pseudonym, Mark Twain. He was born in Florida, Missouri, November 30, 1835, and died in Redding, Connecticut, April 21, 1910. After a brief schooling he was apprenticed to a printer in 1848, and worked at this trade in Philadelphia, New York, and in the West. While he was a pilot on the Mississippi River he was greatly taken with the cry of the leadsman in taking soundings, and when he began writing he signed himself "Mark Twain," the cry of the leadsman being, "By the mark, twain."

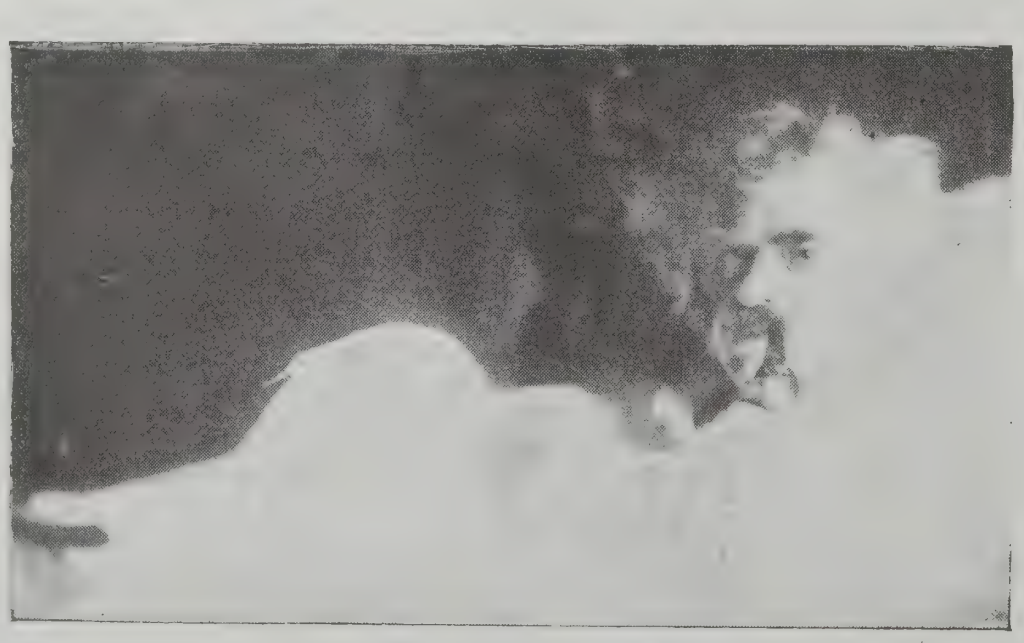


After leaving the Mississippi he tried mining in Nevada. In 1862 he edited a newspaper in Virginia City, but soon tired of that and went to San Francisco where he was a newspaper reporter. For a time he edited a newspaper in Buffalo, but tired of this and settled in Hartford, Connecticut. In "Huckleberry Finn" and "Tom Sawyer," conceded to be his best books, he appears as a master of humor and pathetic suggestion with a great creative genius. Among his better known works are "The Innocents Abroad," "Roughing It," "The Gilded Age," "Life on the Mississippi," "A Yankee at the Court of King Arthur," "Puddin' Head Wilson," "How to Tell a Story," "Autobiography of Mark Twain," and "The $30,000 Bequest."

AUGUSTUS SAINT-GAUDENS
Sculptor

PATRICK HENRY, Statesman

ROGER WILLIAMS
Patriot—Preacher



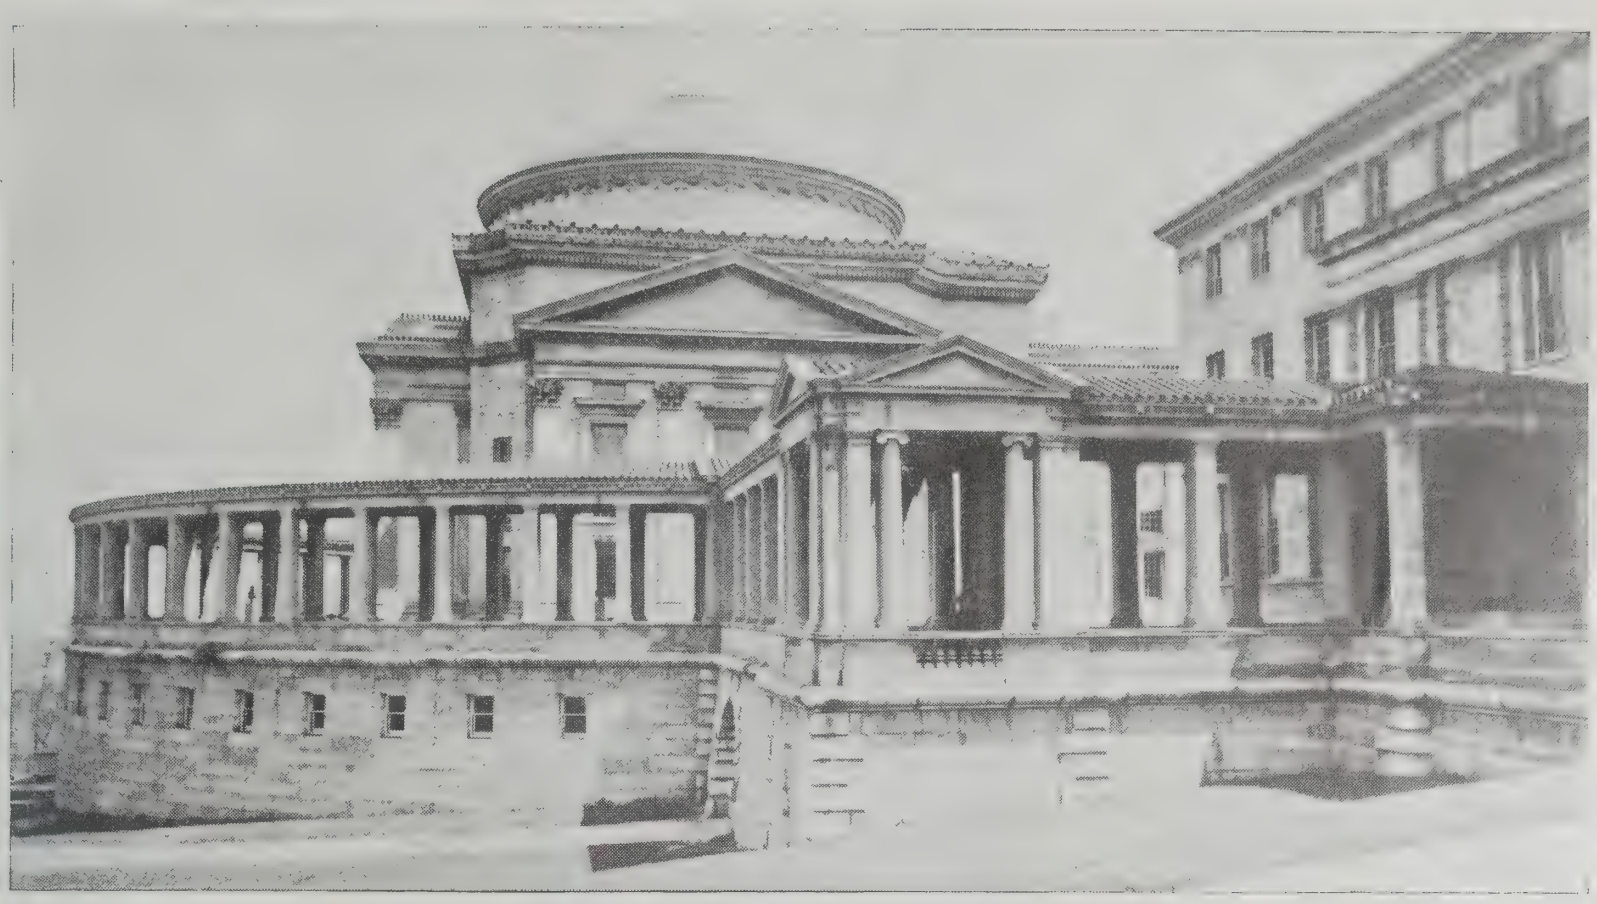
JAMES BUCHANAN EADS.—James Buchanan Eads, American engineer, was born in Lawrenceburg, Indiana, on May 23, 1824, and died in Nassau, New Providence, Bahama Islands, March 1, 1887. He began life as a clerk in a dry goods house in St. Louis in 1833, and then secured work on a Mississippi steamboat in 1839. He early designed some useful boats for raising sunken steamers and in 1861, when called to the aid of the Federal Government, he constructed within 100 days eight ironclad steamers for use on the Mississippi and its tributaries. He built an arched bridge across the Mississippi at St. Louis in 1867-74. His work for improving the south pass of the Mississippi Delta was successfully completed in 1875-79, and his great plan for deepening the river as far as the mouth of the Ohio piers or jetties has been demonstrated to be entirely practicable. In 1884 he received the Albert Medal of the Society of Arts, being the first American citizen to whom this honor had been awarded.

PATRICK HENRY.—Patrick Henry, American orator and statesman, was born May 29, 1736, in Hanover County, Virginia, and died June 6, 1799, in Charlotte County, Virginia. Henry's first speech which singled him out as an orator was made in 1763, in the famous Parsons' Cause. In 1765 Henry was elected to the House of Burgesses and offered a series of resolutions to the effect "that the General Assembly of this Colony have the only sole and extensive right and power to levy taxes." It was during a debate on these resolutions that he used his famous and often-quoted sentence, "Caesar had his Brutus, Charles I his Cromwell and George III—" and then Henry, answering shouts of treason from other members of the House, calmly continued, "And George III may profit by their example. If this be treason, make the most of it." Henry represented Virginia in the first Colonial Congress, and on March 23, 1775, in a speech in St. John's Church, Richmond, Virginia, he used the phrase, "Give me liberty, or give me death." He served altogether four terms as governor.

ROGER WILLIAMS.—Roger Williams, advocate of religious liberty, and founder of Rhode Island was born in Wales in 1607 and died in Providence, Rhode Island, in March, 1684. He came to this country in 1631. Shortly after that date he had trouble with the church and civil authorities, and in October, 1636, he left Salem, Massachusetts, to seek a refuge from the tyranny of his church brethren. With four companions, he sought a place away from the persecution of the Massachusetts and Plymouth colonies, and named the site he selected Providence because of "God's merciful providence to him in his distress." In 1655 he opened Rhode Island to all seeking religious freedom, and especially to those who were driven out of Boston.

ALICE FREEMAN PALMER.—Alice Freeman Palmer, American educator, was born in Colesville, New York, on February 21, 1855, and died in Paris, France, December 6, 1902. She was graduated from the University of Michigan in 1876, and the next year became a teacher of the classics and mathematics at Geneva Lake, Wisconsin. From 1877 to 1879 she was principal of the high school at East Saginaw, Michigan, becoming in the last mentioned year professor of history in Wellesley College. In 1882 she became president of that institution, which position she retained until her marriage, in 1887, to Professor G. H. Palmer, of Harvard University. In 1892-5 she served as non-resident dean of the women's department of the University of Chicago.

WILLIAM THOMAS GREEN MORTON.—William Thomas Green Morton, an American dental surgeon and discoverer of the process of anesthesia, which he called "letheon" but is now known as ether, was born in Charlton, Massachusetts, August 19, 1819, and died in New York City on July 15, 1868. Dr. Morton's patent for his anesthetic was granted in November, 1846. Dr. Morton communicated his knowledge of the new process to Dr. J. C. Warren, and anesthesia, or ether, was made public through an operation performed by Dr. Warren at the Massachusetts General Hospital on October 16, 1846.



SAMUEL L. CLEMENS—Mark Twain

AUGUSTUS SAINT-GAUDENS. — Augustus Saint-Gaudens, American sculptor, was born in Dublin, Ireland, on March 1, 1848, and died in Cornish, New Hampshire, on August 3, 1907. Saint-Gaudens was a sculptor of originality and freshness, who adopted the best standards of French taste and execution without being bound to tradition. Among his better known works are the President Lincoln statue in Lincoln Park, Chicago, the bas relief the "Adoration of the Cross by the Angels," the Shaw Monument in Boston and the Diana on top of the tower of Madison Square Garden.

The selection this time will not please everybody, perhaps. Probably no selection has ever pleased everybody, for we all have our favorite heroes of fact as well as fiction.

Where Illustrious Americans Are Remembered for All Time

THE HALL OF FAME, NEW YORK UNIVERSITY.

European Portraits, 1920

Concluded from page 7

ing look, sometimes a wink, which usually caused Mrs. Webb to make violent notes in books she was carrying. The Webbs retired from the conference hall after raiding a Radical bookstand, Mr. Webb carrying a huge pile of books and Mrs. Webb carrying a bundle of pamphlets. Obviously the average weight of these two burdens of literature was metriculously equal.

The parliamentary leader of the Labor party is the Rt. Hon. J. R. Clynes, M. P., who is a short man, quiet-spoken, and a bit unimpressive. He is much too moderate for his party (in fact he has recently accepted an honorary degree from Oxford and Durham universities, which incurred the contempt of his wilder associates) and he has a hard time to sit on the lid of o'erweening enthusiasms. He looks like a very good politician, a suave man, but greatly overworked.

One of the most conspicuous leaders of the conference is Robert Smillie, the Radical leader and president of the Miners' Federation of Great Britain. "Bob" Smillie has a very strong following and is frequently dubbed in the press as the "Lenin of England." He is obviously a man of rare intellectual attainments. His story is the story of Radical British Labor. He was born, as E. T. Raymond tells us, at Larkhall, "a dismal town in the scarred and blasted mining area in Mid-Lanark, where everything conspires to make life hideous and depressing." The naturally rather gloomy nature of Robert Smillie took on in such surroundings a deeper tinge of pessimism. It is too late, no doubt, for society to secure the lost ally; and if it is to make citizen Smillie impossible it must do more than rail at him. It should study with care certain words of his.

"I have been one of seven persons," he said on one occasion, "who have had to wash in a small kitchen, one little tub serving all of us as our only bath and a change of water taking place only when the water would no longer serve its purpose of removing dirt.

"Now this bestial state of affairs cannot be wholly set to the charge of 'capitalism'; there are poorer and less organized workers who do not tolerate such conditions. But one thing is certain. It may not be especially dangerous to allow stupid men to live in stupid dirt; it may even be dangerous to deprive them of their dirt by force, but to allow the clever and ambitious to grow up to manhood in such conditions is madness."

Let us step in for tea at Arnold Bennett's house in Hanover Square. The circumstances under which this interview was arranged were curious. Mr. Bennett is afraid of interviewers. He has been a journalist himself and he has a fear of journalists. His answer to a letter requesting an interview was one of refusal although he qualified it because he did not want to appear unnecessarily discourteous. Actually one of his particular obsessions is American interviewers and he declares that he has been rather roughly handled by them. In that case we naturally replied that we would not care to thrust ourselves upon him and begged to be excused from the appointment. A reply returned immediately. He implored us to come to tea anyway that he might get a good look at an American interviewer who declined to ply his trade without the victim's full permission.

Arnold Bennett seems to be one of those men who have made literature pay, according to definite principles announced in his pamphlets "How to Live on Twenty-four Hours a Day" and "The Human Machine." He also knows how to spend his money for his apartments are magnificently furnished in luxurious taste. In the midst of this sits the great author with a mustache that looks as though it were pasted on his upper lip. In conversation he sounds like his novels, leisurely but using well-turned phrases.

Mr. Bennett has done a great deal of thinking about America, but one cannot break a promise not to quote him on any intellectual expression of opinion without first submitting it to him for his scrutiny.

Lest we tire our minds with too many British figures let us go round to Cambridge Terrace and call on the ill-fated prime minister of Russia—Kerensky. He is now moving rapidly about Europe preparing for the time when he hopes to return to complete his services to his country. His movements are kept secret and it was only after a long series of negotiations with one of his "officials" in London that the interview was finally arranged.

While awaiting Mr. Kerensky's appearance, in a rather stately drawing room in the home of a Russian exile overlooking Regent's Park, I idled away my time watching two little children playing on the green. Two cute youngsters they were, tumbling all over themselves. Suddenly I heard a commotion on the stairway, as though I were about to be attacked by a Red army, and Kerensky burst into the room.

He is a man of forty-five years but has the face of a boy of twenty-three. He has an immense head, very closely shaven, with a series of pronounced bumps that would delight the eye of a phrenologist. As Mr. Kerensky does not speak English the conversation was conducted through an interpreter.

I ventured to inquire about the Russian situation and the interpreter immediately transmitted the question. For fully three minutes the great lounge quivered as this strenuous Russian shouted his opinions with a great gesticulation of hands. It seemed as though the whole room shook, as with an earthquake, at the impact of this strange personality. Finally this verbal cataclysm ceased and the interpreter turned quietly and said softly: "Mr. Kerensky does not believe that the Bolshevik Government can last."

This was the substance of our interview. A very short time afterward Mr. Kerensky gave me a most emphatic handshake and bolted out of the room. As I stood saying goodby to his interpreter, who had followed me to the door, I saw the ex-premier making a lunge down the staircase, four steps at a time, on his way to afternoon tea. Have you ever seen a mouse in a bell-jar of oxygen? This, today, is M. Kerensky, the man of destiny of the first Russian revolution.

Amid this kaleidoscopic array of prime ministers one gets a certain feeling of admiration for Lloyd George. There is a very different Lloyd George than there was in those days before the war when he played so irritating a rôle as chancellor of the exchequer. In 1913 he was making his reputation by reaching down into the aspirations of the English people and giving them a very human expression. His face then was interesting to watch, for it showed a depth of human sympathy and frankness. Today the face of Lloyd George has many lines. He still knows how to smile, in spite of all he has been through, but he is the self-conscious prime minister of a bewildered empire. Moreover the expression on his face is one of great arrogance and self-esteem. He is no longer a man among people. The opulence of his surroundings as the prime minister has changed the little Welsh solicitor into an autocrat living far, far above the people he represents. The unconventional Lloyd George of 1913 today affects the long, white hair of his predecessor, Mr. Asquith, and the high collars of Mr. Gladstone.

But if you want to see prime ministers you should attend the conferences to preserve the text of the Versailles Treaty. During the Spa Conference this watering place became the back alley of prime ministers. In a walk down the lanes of the old German G. H. Q. one met in one minute M. Millerand, the French prime minister, walking arm in arm with Marshal Foch, then M. Delacroix, the Belgian prime minister, with Lord Curzon, and lastly Lloyd George pouring into the ear of his official press agent, Lord Riddell, what Mr. Lloyd George wanted the public to know the British prime minister did at the afternoon session. None of these men are impressive looking and they seem to live in a state of mental apprehension as to what is going to happen next. M. Millerand is very stout, with a heavy black beard and a frightened pair of eyes. These conferences where they re-discuss the terms of the Versailles Treaty are very harrowing ones for the French prime minister, for his chamber of deputies rake him well over the coals when any concession is made to the Germans. M. Delacroix is very stately, diffident, and an adroit expert at dodging questions.

At Spa the greatest diplomat was none other than Venizelos. He arrived beaming, shook hands all round, explained to everyone how well things were going in Greece, expressed full confidence in the decisions of the Spa Conference and left before they could ask him any embarrassing questions. He played pretty much the same game at Spa as he did during the Peace Conference.

Paris still laughs over the long interview he had with President Wilson. The delegates gasped that the President devoted so much time to the then prime minister of Greece. He was questioned as to what they talked about and what decision was reached with regard to Greece. He assured the correspondents that very little was said about Greece but the interview was spent in getting Mr. Wilson's views on his pet theory, the League of Nations. The cause of Greece was well sustained by Mr. Wilson even against his principles.

One morning the Polish delegation was strangely excited. The long table at which the delegates breakfasted was a hubbub About nine o'clock Marshal Foch rolled up in an impressive limousine and stalked into the hotel. They all stood waiting to shake his hand but the marshal significantly bowed only to the minister for foreign affairs. When Foch came out they all gathered round in the hope that the marshal would unbend but he stalked out with only a curt salute directed solely to Grabsky. Yet it was a great day, for arrangements were made in those few minutes that turned the Polish defeat into victory.

Every one of these characters has developed into a legendary character, yet in the last analysis they are human beings, even as you and I. How easy it is for us to sit back and judge them from the outcomes of their policies and how difficult it is for us to realize that they wear the same size hats we do, much the same sort of shoes, and are addicted to habits not dissimilar to that with which you and I are afflicted.

Hope for the League: The Meeting at Geneva

By W. P. CROZIER

Manchester, England, November—(By Mail).

THE Assembly of the League of Nations meets at Geneva on November 15. It includes every nation in the League, so that not less than forty will be represented there. As a parliament of the world it will, alas, be sadly incomplete. The United States for the present is absent and while her seat is vacant international liberalism lacks its appropriate leader. Russia and Germany, without whom there can be no genuine reconstruction of Europe, are not represented yet, but their turn will come in time. Nevertheless, to any convinced believer in the League idea the meeting of the assembly is like the sight of trees in the desert. It gives hope of life and vigor where hope had almost disappeared. There is hope in the assembly because the League means more to the small powers than to the strong, since they are the victims when the strong powers go to war. Now the small countries, both former allies and neutrals, make up the greater part of the League of Nations and this is their first opportunity of asserting their own standpoint, of exhibiting their belief in a real, functioning League of Nations, and of doing spadework to make it a reality.

Truly, spadework is needed. Hitherto the League has been in the hands of the executive council, which the great Allied Powers control. There are other members on it, but it is difficult, if not impossible, for a small country to stand up almost single-handed against France, England and Italy, and in practice the council of the League is under the thumb of the supreme council, or in other words, the premiers of the chief Allied powers. If, therefore, a great Allied power or powers take any action which conflicts with the League Covenant, it is of no use to look for guidance or redress to the Executive Council of the League. But the assembly is a very different matter. It is a disinterested tribunal, which the council is not. Or perhaps one ought rather to say that the interests of many of its members may be injured by the policy which the great powers pursue and therefore it is very much their business to scrutinize what has been and is being done and to pronounce upon it in the light of the fundamental principles on which the League was built.

The question is, will the small nations of Europe have the courage to stand up firmly to their formidable neighbors, secure in their conscience that they are serving the future and the cause of the whole world? Will other nations, like those of South America, which are also directly interested in the question of another world war even if they are not so near to the area of its probable explosion, give them their support? It is a question of devotion to an ideal and of courage to pursue it. It is also, with the small countries, a matter of their own vital interests and of their will to protect them against the "old diplomacy" of a country like France which, unless guarded against, will some day lead to the old, familiar type of war.

There is no doubt about the assembly's powers, for Article XI of the Covenant accords this far-reaching right to every member:

> "It is also declared to be the right of each member of the League to bring to the attention of the assembly or of the council any circumstance whatever affecting international relations which threatens to disturb international peace or the good understanding between nations upon which peace depends."

That is a clause of great promise if it be used with courage. It recalls a memorable passage in one of Mr. Wilson's Paris speeches. Speaking of the possibility of transferring certain subjects from the council to the assembly, he declared that the founders of the League were "depending primarily and chiefly upon one great force and that is the moral force of the public opinion of the world—the cleansing and clarifying and compelling influence of publicity—so that intrigues can no longer have their coverts, so that designs that are sinister can at any time be drawn into the open, so that those things that are destroyed by the light may be promptly destroyed by the overwhelming light of a universal expression of the condemnation of the world."

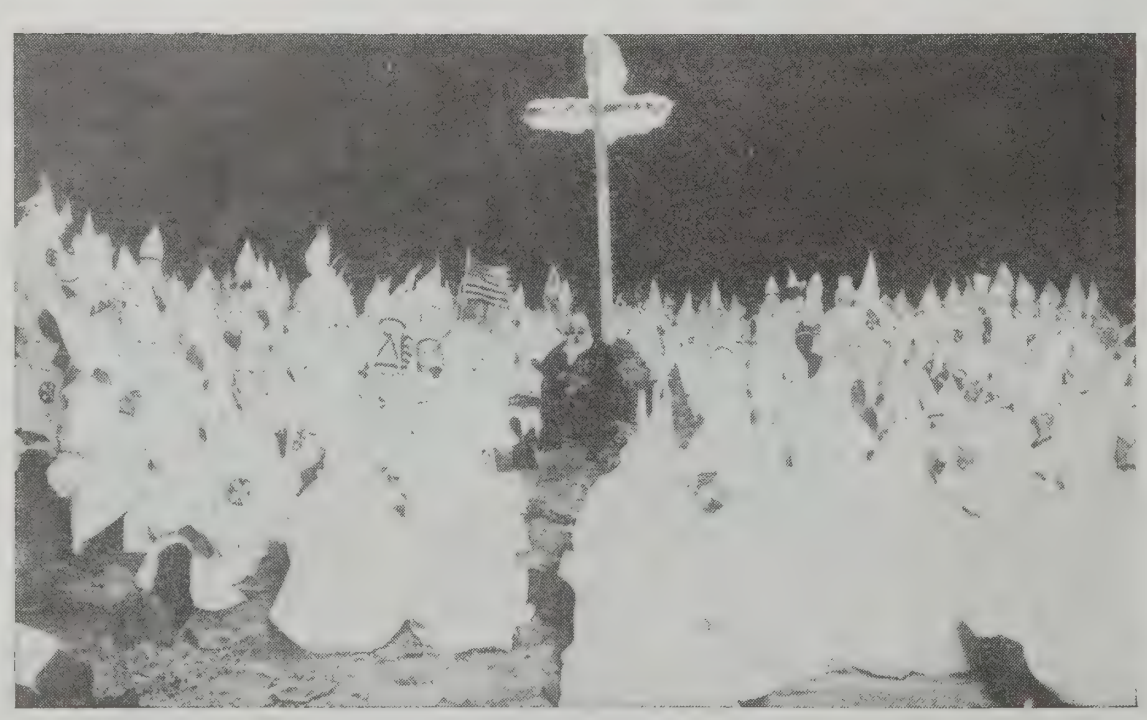
Not too much, of course, must be expected of the first meeting of the assembly, but it is perfectly clear that in a two months' conference the "cleansing and compelling influence of publicity" may be brought to bear on many dark places in international politics. Paris messages have been saying that the French premier will go to the assembly only if it is understood that the question of the admission of Germany to the League is not brought up for discussion. But it is not possible to impose any such restriction on the debates of the assembly; even if an agreement were reached on the point between the great European Allies it would have no binding force on the other members of the assembly. The subject may not arise at all, because Germany herself has made no application for admission, but the discovery that a particular power is anxious to rule out of order a subject which is disagreeable to itself furnishes a measure of the influence which the assembly ought to exert when once it gets to work.

One might cite other problems even more difficult which various people desire to see brought before the assembly as soon as possible. Some of them concern France, like the new agreement with Belgium which the Belgian Government says cannot be submitted to the League in its entirety, as it ought to be, because it contains secret military provisions, or the reports of a convention between France and Hungary which have aroused great suspicion and disquietude among the small nations of Southeastern Europe. Such projects as these seem to be flatly inconsistent with the whole spirit of the League and if anyone brings them up before the assembly, as is quite possible, truly the fat will be in the fire!

Other conceivable subjects concern England closely, like the Anglo-Japanese treaty, the recent Anglo-Persian agreement or the questions of Egypt and of Ireland. There is no word at present that any of these will come up for discussion at this first meeting, but if an American President should really determine to bring Ireland before the League at any future time, how would it be possible to deny his right under the clause which I have quoted? Of course, England or any other power could move that the subject should not be debated and if the assembly assented the question would for the time be disposed of, but short of such a maneuvre, it is difficult to see how Ireland or any similar problem of a nationality in rebellion could be kept from the purview of the League.

I argue, therefore, first, that the assembly should be a powerful engine for carrying out the fundamental objects of the League of Nations if it merely exposed the facts and appealed to the conscience of the world. I argue, secondly, that since the United States through Mr. Wilson made itself the champion of international ideals of liberty and justice, its proper place (with what reservations it may please) is to stand at the head of all the nations in the assembly and all the people scattered throughout the world who care for those ideals and desire to fight for them, but who would fight with a higher hope and a more determined purpose if they were led by the United States. We can understand quite well how the spectacle of Europe in 1918-1920 must have chilled the American spectator, but the American public can scarcely realize how great a body of idealist opinion there is in Europe and elsewhere which awaits a leader who is both convinced and powerful and with what a thrill and fervor it would respond from every country to American leadership. Would that the United States would put all to the test.

But the Geneva assembly will have to handle many concrete questions of great moment. The ex-enemy states, Austria and Bulgaria, are applying for admission to the League. Admission can be granted by two-thirds of the assembly, but the applicant has to give "effective guaranties of its sincere intention to observe its international obligation," and it will be extraordinarily interesting to see what line of conduct is adopted by the assembly, ex-allies and neutrals, toward this qualification. Then there are the neutral applicants for admission, twelve in number. Some of them are harmless little states like Monaco, Luxembourg, San Marino and Iceland; others are the fruits of the break-up of Russia, like Armenia and Georgia, Latvia, Esthonia and Lithuania, Finland, and the Ukraine. Finland presents no difficulty, but the other Baltic countries have as yet scarcely a *de jure* existence as states though they are functioning *de facto*, while as for the Ukraine, no one yet knows what sort of entity it is, nor what juridical body, if any, really represents it. Presumably the assembly will appoint a committee which will report on the credentials of these several applicants and then confirm the findings.



One of the most encouraging aspects of the assembly is that the Scandinavian nations—Sweden, Norway and Denmark—are to be found acting in unison and that they are determined to energize the assembly and make it not only a real instrument of politics but one that shall be readily available. It is quite certain that if the assembly displays an intention to intervene actively in international politics and make the League a real force, some of the great powers will do all they can to restrict its meetings as much as possible. The Covenant only says that the assembly shall meet "at stated intervals and from time to time as occasion may require." The Scandinavian countries will propose at Geneva that it shall meet at least once a year and that an extraordinary meeting shall be held at any time on the demand of ten members of the League. These proposals are extremely important and, if accepted, will go a long way toward making the assembly a real instrument of progress. They furnish an opportunity which various sections of the League members—the disinterested, the neutrals, the liberal-minded, the peace-lovers—can use at any time of crisis or threatened crisis to bring the whole influence of the assembly to bear in the cause of peace and justice. Again, it will be most interesting to see how the various powers will conduct themselves toward the Scandinavian program. Certainly no one can oppose it who believes sincerely in the League. No one can say what incalculable good may not come out of it.

A principal task of the assembly will be to establish a permanent court of international justice. One cannot mention the subject without regretting that the United States, whose lawyers have taken so keen an interest in this project and who could contribute so much to its fulfillment, will not play an active part in framing the constitution of the court. Perhaps, however, America will yet enter the League in time to do so. One must heartily wish it, for the court will be a vital part of the machinery of the League, deciding as it will on disputed questions of international law, on the interpretation of treaties and on breaches of international covenants.

Disarmament is a delicate problem. Months, almost years, have passed since the war and nothing has been done, nor does the state of Europe and Asia suggest that anything will be done soon. But if the assembly means business, its committees may at least furnish the world with information from which we can see what each power is doing and intends to do, and it might at least make suggestions for a proportionate measure of disarmament all round. That of itself would be a step forward. Among the subjects for discussion one ought not overlook the whole question of the "economic weapon"— the screw of economic pressure which the League can apply to an offending state to teach it the error of its ways. Short of actual war, it is the most effective instrument the League will have to make its will felt and the assembly ought to take decisions as to how it shall be exerted by the members against recalcitrants.

It cannot be said that this is an unsubstantial program. If the assembly grapples with it in a sincere and determined spirit, then the League will have entered on a new lease of life. There are powers who would like to ignore the League, who would keep it alive but only just alive, because they know that it must be a critic of their actions. The assembly has the chance to show that it cannot and will not be ignored. It can, if it chooses, put a new aspect on the woeful state of international politics. It can show that in its opinion the League is worth fighting for and that it means to fight. Until the United States comes in almost everything depends on the small countries. When the war ended liberalism was the hope of the small nations. Today the small nations are the hope of liberalism.

Midnight Powwow of the Knights of the Ku-Klux Klan

Reports from the South indicate that the Ku-Klux Klan, famous in the reconstruction days of the Civil War, has been revived. The headquarters of the new organization is at Atlanta, and Col. William J. Simmons, formerly a Methodist preacher, is at the head of the society. This photo is a flashlight of a meeting at midnight on the top of Stone Mountain, near Atlanta.

Tagore, in America, Seeks Aid for University

Says His People Woo Truth "In Life, Not in Textbooks"

INDIA has been represented to the western mind as a land peopled by beggars, a haunt of age-old superstition, and the lasting dwelling place of dense and all-pervading ignorance.

We have with us a beggar from India, Rabindranath Tagore by name, who comes to plead in behalf of the dwellers in his country for the boon of greater opportunity to seek, in the highest dome of thought, Truth.

But he does not come as emissary from a benighted peninsula. He comes to ask of the riches of the West a sufficient part to enable him to spread further an enlightenment of knowledge to his people, who he believes are now the most cultured in the world.

It is a new rôle for Tagore, this part of mendicant. The world's honors have been his without the asking. Money sufficient for all his personal desires in this existence has flowed easily to him. His eminence in literature has been established beyond peradventure. The award of the Nobel prize has settled his place, even in the minds of that ever-present generation of doubters who demand a sign.

He has come, a wise man out of the ancient East, to ask alms and an understanding intellect from the wealthy West. He desires to create a university. He seeks the material aid that masters and scholars may satisfy their physical needs, while their minds range the Infinite for Truth He hopes for the understanding that the West, too, may in its measure profit by the learning of the East.

America, land of a thousand universities and a hundred thousand schools, can give the famous Indian scholar and poet the material he asks. And America probably will.

But whether America can give him the understanding for which he hopes may be a subject of doubt.

American pride has always swelled at the thought of American liberality in education. The fine buildings of our college towns, the progressive practicality of our modern educators, and the almost universality of our common schools, have always ministered to our feeling of calm assurance of premiership in opportunities for the spread of culture.

But to Rabindranath Tagore knowledge is a thing apart from costly architecture, and cannot be confined within the limits of textbooks. And general culture does not have its basis in accurate memories of the Three R's.

It was like going to another world, the seeing of this Hindu poet. In a narrow, prosaic hotel room an interviewer was permitted to meet him and ask him regarding his ideal for a university. It had been announced that he hoped to extend the limits of his old boys' school, Shantiniketan, "Abode of Peace," an institution he has maintained for thirty years out of his own income.

But a listener to Tagore forgets the limits of time and space and visualizes universities of spheres.

Only in rare moments when he speaks of the alien government which imposes the universities now in India does a listener remember that Tagore is one of a subject people, and that to him the gentle rule of Britain is still the domination of an alien race.

Clad in a flowing gray robe and facing as always, the sun, Tagore is the embodiment of the eastern savant to whom the western world has been introduced in story and poetry. His flowing gray beard and his face, tanned a soft brown during the generations in which his ancestors faced the hot sun of his peninsula, and his black eyes which glow with marvelous softness despite their unmistakable piercing qualities, give an interviewer a sense of unreality.

When Tagore speaks this impression grows. His voice is high and soft, with an almost spirit-like quality. His language flows with rhythmic purity.

Under the spell of his words, it would be a hardened materialist or hidebound creedsman indeed who would not sway to the music of eastern thought. His language is beautiful and the depth of his thought is striking. But somehow a listener, eager to hear his reasoning and pay attention to his knowledge, finds himself succumbing to other influences.

Perhaps it is the timbre of Tagore's voice. Perhaps it is the picture he makes. Perhaps it is the combination of these with his philosophy.

Quotation of the Hindu scholar is attempted only with a preliminary apology because of lack of exactitude of language by which alone his poetic thought may be appreciated fully.

(C) U. & U.

SIR RABINDRANATH TAGORE

Mr. Tagore, he is a knight by the way, was asked to make clear the differences between the university he plans and universities familiar to the American public.

"Some of your western universities," he said, "have followed to some extent the ideas we of the East possess of universities. In Paris, and in Cambridge and in Oxford there have been at different times teachings similar to those in India."

Mr. Tagore then began to speak of university buildings. Frequently he adverted to buildings.

"The buildings in the western universities are fine," he said. "They are beautiful. To them come the scholars from all over the land. And at them they linger, and imbibe the knowledge contained within textbooks, and taught to them by the masters. They are birds in beautiful cages. They linger a few years; then someone opens the cages and they fly away.

"To me, a university is a perpetual thing. There is something dead, something dried, all cut and dried about these universities of the West. It is not the syllabae, the curricula, nor the fine buildings that make a university. There is something more, something growing, something living.

"In our universities in India, the master may pick his scholars. The grammarian may select those who desire to study grammar. The teacher of philosophy may choose those who seek philosophy.

"And these scholars come and sit by his side. It may be in a humble place. The master's wife will cook the meals for his scholars, and the master's home will be their dwelling place. There will be no dollars nor cents connected with their search for Truth.

"The master will unfold his knowledge and the scholars absorb and imbibe his honesty, his truthfulness and his spirit of self-sacrifice. The masters of India are simple men. But they believe they have a responsibility in connection with the knowledge they possess. They believe that if they do not impart that knowledge to others it will depart from them.

"Together then, not in textbooks but in life, master and scholar search for the Truth.

"In this unity of life in which they work and study, I believe, lies the real university, a perpetual and a perpetuating institution."

Mr. Tagore was asked to discuss the condition of the masses of India with respect to general knowledge such as is disseminated in American common schools. In complying with the request, the Hindu scholar seemed completely unconscious of the American feeling of the superiority of American schools. Neither did he seem to realize the belief has long stood unchallenged in this country that the masses in the Indian peninsula dwell in abysmal ignorance.

"Mass education, that is quite a hobby of mine," he said. "In India, I believe, we have greatly the better of you on that score. I do not believe that it is in accurate knowledge of reading and writing that culture necessarily lies.

"In this country, the students come to a fixed place where your fine school buildings are located, and there they receive the knowledge that is contained inside of textbooks."

Mr. Tagore recurred to his phrase of the deadness and dryness of such routine education.

"In my country," he said, "there are trained men, professional men who go from place to place. They go to marriage feasts or other great festivals. Thousands upon thousands of persons gather to hear them. They include the young and the old. They listen with rapt attention while these masters recite with action and with humor the living, vivid stories of our literature. They recite the great epics, the Mahabarata and the Puranas, and the tales of mythology. And as they recite them, give them life.

"The people become acquainted with the great operas, the religious lyrics and the chorus songs, which inculcate the great truths.

"It is like irrigation, this culture of ours, irrigation that brings the waters to every man's door. The people imbibe the great truths of philosophy, and they learn the poetry of life."

Mr. Tagore hopes that his university may develop into an institution to which westerners may come and learn something of the philosophy and intellectual treasure of his people. He hopes, too, that some of the scientific knowledge of the West may be placed at the disposal of the youth in his country.

Tagore will probably remain in America during the winter months. He plans a trip through the southern states, which he says he was not privileged to visit when he was in the United States previously.

Christmas in the Pueblos of the Aborigines

Concluded from page 3

to the ankles are white buckskin affairs like bootlegs, and on the feet are red moccasins embroidered with serpents' heads. A bunch of feathers dyed in red and blue are held in one hand, and a showy silk handkerchief in the other. Heavy earrings, a score of bracelets and a row of turquoise and shell necklaces complete the toilet.

The men face the women, a strump on the drums, and the dancing begins. The chorus by the choir starts in a low gutteral. The feet of all the dancers move slowly in unison with the music. Arms and hands bearing the feathers wave aloft to the movement of feet. Gradually the chorus rises, the feet move faster and the hands full of feathers wave more swiftly. The chorus becomes a wild allegro. The men are gyrating so fast that one can scarcely distinguish their features, while their black hair stands out tangent to their heads. The women's feet are moving so fast that one wonders if they will ever stop. The native onlookers' ululations grow louder and more rapid, and the music is drowned.

Truly, he who is not moved at this scene is most phlegmatic. The adobe white walls a yard thick, set with deep-recessed windows and many crude pictures in oil, representing scenes in Christ's life; the pitiful little altars at the further end, adorned with candles, huge bunches or bouquets of paper flowers, and a wreath of tinsel and several wooden crosses; the logs above all, yellow with great age, that support the roof; the perspiring, painted Indian men, whirling about as if in wild delirium; the dark-visaged women, in garments of livid colors and with now disheveled hair over their faces, moving about with upraised hands, waving feathers and silk handkerchiefs in perfect time to the rapid chorus; the several hundred black-eyed, excited, shouting onlookers, from wrinkled and bent old men to children, clad in blankets and strange garments of barbaric fancy; the dozens of young women, among the mass of spectators, who hold lighted candles above their swart faces and ebony hair, while they scream with ecstatic excitement, all form a scene that the most indifferent can never forget in a century of life. The room resounds with the shouts of the Indians, and the altar shakes with the reverberations and the stamping of feet. For three and four hours this strange, impressive ceremony continues. At exactly midnight, the bells on the roof are jangled vigorously. At a signal the chorus closes, and the dancers, running with tiny streams of perspiration and mingled colors, cease. A sudden hush comes over all. In a few minutes the assemblage participates in the celebration of the mass by the lenient priest.

The Indians of the Laguna pueblo know full well the cheer of Christmas time. The women dress in the most striking combinations of blue, green, red and black and may be seen bearing a carefully prepared pie to the home of a friend. There is a wealth of black cake throughout the village and bread stuff, seasoned with chili, is on every table. The old padre is fairly submerged by gifts of Indian culinary. Wine is a mocker here in the land of the red man, also. A Laguna decoction, squeezed from the zinfandel grape and toned by an ingredient from the cactus, will set any man's blood tingling. Every night in the holiday week there are several hundred shining eyes in the ancient pueblo; but the drink acts as a promoter of pure and simple geniality, seldom combativeness.

Every one in Laguna visits in the holiday week. The more sociable will sit up all night smoking, eating and drinking, especially drinking. Thus the gayety proceeds. It reaches its culmination on New Year's Day. There is a feast in every domicile for which ample preparation has been made. The next day comes the reaction; the holidays are over and Laguna takes on its customary air of quiet and rest, to be broken only by the advent of Easter and its attendant ceremonies. The men duly seek the sunniest spots outside their little homes, and basking in the genial dry sunshine, slowly roll their cigarets of tobacco and corn husks and dream the days away. The good housewives put away their finery and go about their household duties, and the pueblo sleepily awaits the coming of spring when there is work for all in the planting of the year's harvest.

Pancakes in Prison Like Bread Cast Upon the Waters

By THOMAS J. MALONE

WHEN C. S. Reed resigned last June as warden of the Minnesota State Prison, Stillwater, to become sales manager of the Michigan State Prison, J. J. Sullivan, then deputy warden, was promoted to the wardenship.

Mr. Sullivan made no changes in prison regulations or methods on donning civilian clothes in place of the blue uniform and moving to the outer office from his old one beyond the first barred door. He had been in accord with the program of his predecessor and with that of the warden before him, Henry Wolfer, the man who conceived and superintended the building of the Minnesota institution. But he did make one notable change affecting the lives of the inmates.

He began serving pancakes for breakfast.

Most men are just naturally pancake fans. A few days after Warden Sullivan took hold, each of the seven hundred seventy-eight inmates encountered something that many had almost forgotten, something that teased the smell, gladdened the sight and rejoiced the taste—a stack of wheats.

Before every man at breakfast that morning was placed a plate containing three piping hot, mellow brown, crackle-fringed, six-inch wheat cakes. With the cakes were syrup, sausage and coffee.

In the memory of the oldest inhabitant—and he has been there since 1876—pancakes had never before been served to inmates of the prison. Think of forty-four years without a pancake! The constitution has something to say against "cruel and unusual punishments."

Warden Sullivan, himself a pancaker, had not heralded the coming of the feast. It was a surprise to the men. Three thousand cakes were baked and served that morning, for some of the men "got away" with six or more, second "orders" not being denied. The cooks had no time for flipping nor somersaulting.

Production in the prison factories increased notably that day. A few days later pancakes were again served for breakfast. They have become a regular part of the prison menu. Twice a week breakfast centers around them. Corn and buckwheat cakes are in prospect.

The new warden made another innovation in the bill of fare. He began serving tea for dinner, the noon meal. Theretofore the routine had been coffee for breakfast, water for dinner and tea for supper. While inmates may not be interviewed and their views are not obtainable for publication, tea for dinner, coming after the pancake surprise, is understood to have intensified a conviction that the warden had at heart the welfare of his wards.

"I believe prisoners should be well fed," he said, when the news of these gustatory privileges had reached the outside world and he was asked about them. "Minnesota has always fed its prison inmates well. I believe in going even further.

"Men in prison retain their old outside appetites for 'eats.' The doughnut man craves doughnuts; the pumpkin pie devotee dreams about pumpkin pie. We do not pamper the inmates but we treat them like men—think of them as such. Doing that, we take the logical step to pancakes for breakfast."

J. J. Sullivan, promoted to the wardenship for merit after nineteen years of service in the employ of the Minnesota prison, believes in the good old-fashioned, time-tested proverb that the way to a man's heart is through his stomach. He will challenge the anatomists on that. He believes it applies to the man inside a prison as well as to the man outside.

The theory is that a well-fed prisoner is likely to be a fairly contented one. The conception of the well-regulated prisoner as pale, emaciated, depressed and despondent does not obtain at Minnesota, and never has obtained there.

"I joined the prison staff as a guard at $40 a month," the warden recalled, when asked to tell something about changes in prison conditions in his nineteen years there. "'Upside down' about covers what has taken place.

"When I began guard duty, the old prison was in use, at the foot of the hill in the heart of Stillwater. In its place, we have today a model group of buildings in a 22-acre inclosure two miles from Stillwater."

The prison owns one thousand acres of land. Five hundred seventy-two acres are under cultivation.

"As I recall it," he continued, "the cells were lighted by candles when I came to the prison. Each cell had an earthen jar filled once a day with water which served for both drinking and washing.

"The men ate breakfast and dinner in the dining hall but took supper in their cells, a solitary experience. Only such tobacco was used as was made in the prison.

"All inmates wore the regulation prison shoe, coarse and heavy—brogans. Only the prison issue of other wearing apparel was permitted. Conversation among inmates was allowed only when they were let into the yard on the big holidays—the Fourth of July, Thanksgiving Day, Christmas, and New Year's.

"An inmate could have only one visit a month from the outside."

So bleak a condition no longer exists at the prison. Mr. Sullivan's eyes twinkled under bushy brows as he told the more pleasing story of the present.

"Today every cell in the Minnesota prison is electric-lighted and has running water, hot and cold, and a lavatory.

"All three meals daily are served in the dining hall. Food comes hot from the ranges. Tobacco may be sent to the men from the outside or they may buy it themselves, all kinds.

"As for clothing, inmates today wear prison issue coat and trousers, a plain gray much like that of the mail carrier's uniform, but they may wear any good quality business shoe which they may care to buy or which may be sent them. They may have white handkerchiefs and underwear within their means. As every able-bodied inmate makes money by his work in the prison industries, each has a fund on which he may draw for such purposes.

"Conversation is permitted at meals every other day and whenever the men are out in the yard. They are out not only on holidays but on virtually every Saturday afternoon in summer.

"We do not limit arbitrarily the number of visitors an inmate may have in a given period. Whether a visitor shall see an inmate is determined by the circumstances in each case. Our policy is liberal."

The prison attitude toward recreation and diversion is enlightening.

"There were no games in the old days," went on the former $40-a-month guard. "Today baseball is an established part of the institution program, with a first and a second inmate team every season and with a game every Saturday afternoon and every holiday, if weather permits, through the summer. Civilian teams from outside meet the prison team on its home diamond.

"Horseshoe pitching has been introduced recently. Other games are in prospect.

"For those who desire to engage in special study along cultural lines there is the Pierian Chautauqua Circle, made up wholly of inmates, which holds regular meetings, observes a definite program and now and then stages an entertainment in the prison auditorium before the rest of the institution's population. This circle is self-directed. Its literary, dramatic, and musical programs are justly popular.

"The prison band is another agency that serves to lift the inmate out of the monotony of his surroundings."

Warden Sullivan was quick to nail an intimation that possibly Minnesota inmates were too well cared for, had too good a time.

"These changes have not been introduced with a view to softening the prisoner's lot, as if to make prison life attractive. Prison life will never be attractive to men born to be free. The very fact of restraint, of being kept within bounds, is severe punishment.

"If we are to get anywhere in trying to help the convict to be a better man he must be in a state of mind that will permit of betterment. Reformation cannot be forced. Society is just as well protected when prisoners are treated like men."

J. J. SULLIVAN,
Warden, Minnesota State Prison, Stillwater.

Two broad questions were asked the warden.

One was this: "Are you an optimist or a pessimist as to prison results on the inmate? Does your experience convince you that most inmates really learn their lesson and do not revert to crime after discharge? Or do the majority go back to lawbreaking?"

The other was: "Do you believe most of your inmates are here because they are basically criminal in make-up, have a wrong mental slant through either birth or environment that almost inevitably impelled them to do things that sent them prisonward?"

J. J. Sullivan declared himself an optimist. "Emphatically," he said, "the majority of men who serve prison sentences do learn the lesson of prison life and go straight afterward. It is the occasional backslider, or the chronic crime committer, who attracts public attention and gives ground to the widely accepted belief that most prison inmates do not profit much by their experience.

"Men in the work know better. I get letters every week from men who at some time or other served time in Minnesota prison. They are splendid letters, many of them, fine, manly letters from men who have made good. They tell me what they are doing, how they are getting along, about their families, their prospects. Many have changed their names, gone to new places and begun all over again.

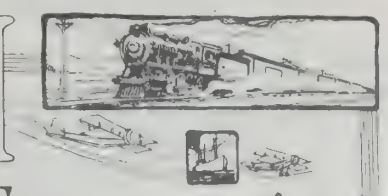
"In the various prison industries—the twine factory, the farm implement shops, the agricultural work—men learn trades they can follow through life after release. Many acquire a liking for hard labor, find zest in producing things worth while. Not a few learn to read and write while in prison. Others learn lessons of great value about the care of their bodies. The prison is a school."

Of course, this answer to the first question suggested the answer to the second.

"There probably is a 'criminal type,'" the warden said. "Some men seem unable to keep out of crime, but by no means all men who get sent to prison are such.

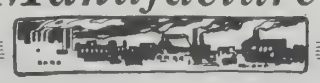
"On the other hand, the pickpocket or the forger who is ever at it, plying a trade, seeing no wrong in it, returning to it with each release from confinement—he may be a criminal type."

It is a big job to be warden of the world's model prison, but J. J. Sullivan, hard-boiled veteran of "the silent city," champion of the pancake, refuses to get excited over it.



All Cairo Watches Moving of Holy Carpet

This photograph just received in the United States illustrates the ceremony incident to the departure of the holy carpet from Cairo to Mecca which takes place yearly in the late summer. An elaborate ritual attends the pilgrimage and the ceremony is one of the most brilliant in the picturesque East. The start of the pilgrimage is pictured.



The Three Arts

Agriculture

Manufacture

Transportation

A western syndicate has leased 400,000 square miles of Russian territory for a period of 60 years. The same syndicate reports it has made arrangements for the purchase in America of $3,000,000,000 worth of goods in the next three years.

A committee report made recently to the thirty-second annual convention of the National Association of Railway and Utilities Commissioners declared that public ownership and operation of the railroads has failed wherever it has been properly tested. It stated that private ownership and operation with public regulation was the only just and honest manner of conducting the public utility business of this country.

The danger of the pink bollworm crossing from Old Mexico into the United States is alarming the commercial interests and cotton growers of Texas. The infected part of Old Mexico is the rich Laguna district, a section of territory on the boundary line of the states of Durango and Coahuila containing 2,000 square miles in area, entirely surrounded by mountain ranges and but 250 miles from the Texas border. This section of Mexico is one of the most fertile farming regions in the world, the chief crop being cotton. Almost the only known way to wipe out the pest is to stop planting cotton for several years.

The president of Guatemala has undertaken to interest foreign capital in the development of more than 15,000 square miles of territory in Guatemala. A new department of agriculture with a minister in his cabinet has been created by the president.

A pool to assist in the financing of the live stock industry of the country is being formed by leading bankers of Chicago. The capitalization will be $30,000,000.

William B. Thompson, president of the Louisiana division of the American Cotton Association, has advised cotton producers to leave all low grades in the field to be eaten by cattle or plowed under and to take steps "to make it impossible during the coming season to produce more than one-half the present crop."

American business relations with South America have been practically paralyzed by the derangements of the exchanges.

The advance figures of the Census of Manufacturers support a belief that the total value of the manufactured products of the United States for the year 1919 will exceed $60,000,000,000—half the manufactured production of the world.

A pneumatic planer has been developed which displaces six or eight men on ship and car building.

A department has been established in the Bureau of Chemistry to assist industrial and commercial concerns to apply the valuable processes and discoveries made each year by government chemists.

A large number of the country's colleges are about to install courses in industrial management. Business concerns will raise $100,000 to finance the movement.

The parcel post department in Omaha is to be completely motorized with a fleet of 50 trucks serving 20 zones. Department stores expect to take advantage of this service and deliver by parcel post.

Huston Thompson, member of the Federal Trade Commission, succeeds Victor Murdock as chairman of that body.

Morgan County, Alabama, farmers have saved about $10 a ton by mixing their own fertilizer under the direction of the county agent. Three hundred farmers joined the movement and bought a carload of ground limestone.

Bermuda bars automobiles but has decided to permit the importation of small tractors because of the prohibitive cost of horse power on the farms.

The House Immigration Committee is planning to introduce a bill providing almost air-tight restrictions on immigration.

Forty-six states of the Union, reports the Bureau of Public Roads, expended $400,000,000 on rural roads and bridges during 1919. This expenditure is one-third greater than that of 1918.

The average total authorized capital of new enterprises formed in the United States prior to 1919 was approximately $2,000,000,000 a year. The total authorized capital of enterprises launched during 1919 amounted to $12,677,000,000 and the capital issues of 1920 have thus far exceeded those of 1919. The change in money values is responsible for much of the increase.

Sawmills, once very plentiful in Maine, have almost disappeared. Only three remain between Bath and Augusta. The death of the industry is due to the fact that pulp companies have bought up most of the spruce.

Premier Lloyd George announces that Great Britain will begin to trade openly with Soviet Russia as soon as it is certain that Russia will carry out its agreement relative to returning British prisoners.

Secretary of Agriculture E. T. Meredith in a Detroit speech strongly opposed the plan of Secretary of the Treasury Houston to increase taxes on automobile manufacture and use. Mr. Houston was Mr. Meredith's predecessor as head of the Agriculture Department.

Fifty-four miles of railway in the Temiskaming region, opening up to northern transportation a fertile section of the province of Quebec, is shortly to be constructed by the Canadian Pacific Railway. Contract between the company and the Quebec Government was signed during the week.

A decrease of three per cent in retail food prices in October throughout the United States was noted in statistics on the cost of 22 articles of food, made public today by the Department of Labor. Greatest decreases were in prices of sugar, 24 per cent, and potatoes, 15 per cent. The price of eggs increased 14 per cent. The average family expenditure for the 22 articles of food decreased in all of the 51 cities from which monthly prices were tabulated, except Houston, Texas, where there was an increase of approximately five-tenths of one per cent.

National business reviews predict an extensive program of government construction work for 1921.

One-seventh of the total peat lands in the United States are located in Michigan and experiments are being conducted at Chelsea in turning the product of the bogs into coke.

The Manufacturers' Association of Connecticut has gone on record as opposed to the closed shop and as favoring a system of pay which will recognize production and service.

The Bureau of Railway Economics announces that the revenues of Class One roads in September were $29,343,000 less than the amount expected under the new rates.

A Philadelphia varnish dealer has been ordered to cease advertising his goods as "government supplies," "war supplies," and to stop referring to his place of business as "Government Supply House." The goods which he sells never belonged to the government.

The rubber trade of the British Isles has lodged a protest with the government against the increasing importation of American tires.

Dealers of power farming machinery report a steadily increasing number of farms on which tractors and trucks have completely displaced the horse.

During the rush season California farmers work their tractors 24 hours a day, operating three shifts of eight hours. Tractors have been used in California for more than 15 years.

Two and one-half million farmers are now using automobiles and are making substantial savings in time and money as a result. There is a car for every six persons in Iowa and Nebraska, although there are only 401 persons in those states whose income exceeds $25,000.

Crop production of the lower Mississippi Valley has increased a billion dollars during the last ten years. Reclamation of low lands, departure from the one crop system and the adoption of farm tractors are held responsible for this great annual addition to the wealth of the nation.

Motor trucks moved 1,200,000,000 tons of freight in the United States last year. They were second only to the railroads as public carriers.

The Merchants' Association of New York City states the labor turnover in 1920 of skilled and semi-skilled workers will amount to 125 per cent. The turnover rate of unskilled labor is twice that.

The new cotton crop for Egypt has been estimated at 612,000,000 pounds.

The reports of the inspector of factories and workshops of England disclose the fact that since the reduction of the 48-hour week in most British industries there has been a considerable decline in production.

Baltimore garment workers claim that they have procured backing for a million dollar concern and that they expect to make women's clothing in their own shops and retail it through a chain of stores in the near future.

While results are somewhat imperfectly known, indications are that the 1920 cereal crop of the world will be six per cent greater than that of 1919.

It is estimated that the world's sugar crop for 1920-21 will be approximately 1,700,000 tons greater than the total production of 1919-20. It must be understood, in considering this estimate, that there are still two or three months of growing weather which can materially affect the crop. The indicated world production this season is more than 17,000,000 tons of cane and beet sugar.

An illustrated folder which includes a map of the principal highways of the state of Oregon has been issued by the Forest Service. The map should prove valuable to tourists. Address: District Forester, Portland, Oregon.

Woodlands on farms comprise more than one-half of all the forested lands. The present yearly farm income from woodlands is estimated at $15,000,000.

The Department of Agriculture declares that exposure to weather frequently causes greater destruction to farm implements than actual use. It urges that all machinery and tools be stored before winter sets in.

Despite the fact that oats ranks next to corn and wheat in acreage and value in the United States, specialists of the Department of Agriculture report so little attention is given to this important grain that the crop is sometimes unprofitable.

New Mexico farmers who grow pinto beans declare that the next few years will see this product a regular article of food in every home in America. The farmers have standardized their product and, to a large extent, market it co-operatively.

The Department of Agriculture has prepared motion pictures for use in South America, showing American methods of breeding and handling live stock. Many of the department's bulletins are translated into Spanish for use in our neighboring republics.

The state of Maryland has appointed a director of farm products upon whom will fall the responsibility of maintaining and operating motor lines on state highways and from terminals, docks and depots for the collection of farm products.

A census of millionaires taken by the Income Tax Division of the Internal Revenue Bureau, although two years behind time, is interesting. It shows that there were 4,000 fewer millionaires in the United States in 1918 than in 1917. The total number of millionaires in 1918 was 20,944.

Briefly Told

That the savages of prehistoric America knew the use of splints in the treatment of fractures is revealed by examination of the skeleton of a young woman recently found in the pueblo ruins of New Mexico. An arm, badly broken in two places, was enclosed by six carefully made splints of wood.

A congress to be organized at San Sebastian will consider the furthering of ideal business relations of Spain and France. The subjects considered will be commerce and industry, art, literature and science and international touring arrangements.

Sir Ernest Shackleton, explorer, is planning another icy expedition, this time to the North Polar regions.

Lady Ramsey, former Princess "Pat," of Connaught, is living in Paris in a three-room flat that does not even boast a bathroom. However, she outranks the British ambassador to France, and there is much speculation over the peculiar situation of social precedence.

Congress will be asked to appropriate $11,000,000 a year to establish a definite national forest program to cover the whole United States.

During the ceremony of the "crossing of the equator" on his recent voyage the Prince of Wales burst forth as a poet, composing an "Apostrophe to Neptune." It contains considerable slang, evidently for shipboard consumption.

The *Northwest Square Deal,* daily newspaper of the Non-partisan League at Aberdeen, South Dakota, has gone into the hands of receivers. Many farmers invested heavily in the publication.

The Civil War is not quite over. In Texas the school authorities are contesting the use of a history textbook on the ground that it slanders the South.

American films, which have been the favorite in England for the past five years, are suffering a slump due to the fact that certain producing concerns have been sending over films of an inferior character.

Investigators state that this year's Cuban sugar crop will be one of the largest in the history of the island.

An expert restorer of ancient documents in Washington is able to split a thin sheet of paper, separating the writing on the two sides, insert a middle layer of paper and cover the entire sheet with a thin silk gauze. This enables the document to stand considerable handling.

"Carbocoal" is a preparation of crushed soft coal carbonized at a relatively low temperature. It resembles anthracite and is smokeless.

Japanese constitute 42.7 per cent of Hawaii's population.

Declaring that it spoils the tranquil peace of the country, the English rural people are making moves to abolish the motor bus from the country road. These busses roar through quiet little villages raising great clouds of dust, frightening pedestrians and exciting the wrath of motorists.

No representative of the United States will attend the sessions of the assembly of the League of Nations, it is announced authoritatively

A new poison gas for war purposes in units small enough to be carried by every soldier is a new device of the Chemical Warfare Service. The new gas is so deadly that it was found necessary to strengthen the masks to make them effective.

One billion barrels of oil annually can readily be used by the United States.

Greensburg, Indiana, is known as "The Lone Tree City," because of a tree growing on the courthouse tower in that city.

The Supreme Court has ruled that an insurance policy on the life of a suicide is payable provided all the conditions of the policy are complied with.

One-third of the population of Germany will emigrate to North America and South America within the next few years, according to a German authority. The reason given for the emigration is that Germany is no longer large enough to provide a living for her increasing population.

To safeguard the nation's bread supply up to next midsummer it will be necessary for Germany to import 1,600,000 tons of wheat, rye, corn and barley.

Maintaining that the mayor and councilmen were not progressive and that sidewalks and lighting facilities were in need of repair, the women of Yoncalla, Oregon, elected an entire feminist administration at a recent municipal election.

Germany, although facing a huge deficit and regardless of treaty restrictions, plans to build a modern light cruiser costing 125,000,000 marks.

To demonstrate a means of ending an epidemic of pay roll robberies and to prove that modern business may be conducted efficiently without the use of small change, a Rochester company is going to conduct its affairs entirely without the use of money, using checks, trade acceptances and travel checks to make payments of every kind, including the pay roll.

Major General Sir Charles Townshend, defender of Kut-el-Amara, has been elected to the House of Commons.

A coal mine owned by South Dakota ships two hundred tons of coal daily. The coal is furnished to the state institutions but individuals may purchase coal at the mine.

Statistics show that 1,096,436 deaths occurred in the United States during 1919. This is at the rate of 12.9 per 1,000 population. The unusually high rate for 1918 was due to the influenza epidemic. This rate was 18 per 1,000.

Eighty thousand head of sheep graze on the mountain ranges of the Okanogan National Forest in Washington. There has been an abundance of snow in the mountains, which assures pasture for next season.

Within walking distance of the west of London nineteen acres of woodland have been set apart as a sanctuary where birds can build. Between 40 and 50 species are known to have used this sanctuary.

Horatio Blanco Fombona, journalist and poet, held by American military forces in Santo Domingo, has gone on a hunger strike as a protest against his imprisonment and also because of the prison diet of beans and potatoes.

Major General McIntyre, chief of the Bureau of Insular Affairs, in his annual report, urges American capital to develop the oil lands of the Philippines which he says are extensive.

Among the equipment received by the Ordnance Department of the army during the past fiscal year to be retained as part of the establishment were 118,000 machine guns, 1,500 37-millimeter guns, 11,000 guns and howitzers of various calibers, 58,000 automatic rifles and more than 1,000,000 rifles.

New York soldiers now in Germany could not vote in the recent elections because the ballots mailed from Albany did not reach them in time.

Declaring that equal suffrage placed women on a par with men, a Chicago judge fined two women for contempt of court when they refused to remove their hats at his request.

More than five hundred youths from 15 to 17 years of age have been discharged from the army at Fort McDowell this year for having given fictitious ages.

One of two Kamchatka sables escaped from its captors on board a ship anchored at Seattle and fled to the shore. The sables were the first living specimens of the kind ever carried over the seas to America, and were consigned to an eastern fur farm

A bank "manned" entirely by women, with women officers, organized mainly to back the woman who wishes to go into business for herself, is to be established in Philadelphia.

The shortage of fuel in Scranton, Pennsylvania, was so great recently that it was necessary to obtain a physician's prescription before coal would be delivered. Scranton is in the heart of the anthracite coal region but the coal mined there was rushed to all parts of the country where higher rates prevailed.

War-Profits During the Reign of Jewish Copper Kings

The Baruchs, the Lewisohns, the Guggenheims, and many a lesser son of Judah, with their "Gentile fronts," completely controlled the copper market on both sides of the Atlantic. How they claimed credit for Patriotism. How 16 cent copper was sold for 27. Enormous profits by Jewish concerns on "surplus" after the armistice.

Aztalan—Indian Babylon on the Mississippi

Have you ever read of the great prehistoric capital of the Upper Mississippi Valley, which, uncovered by searchers, is disappearing because of failure to make provision for its care?

People Pulling Minnesota Out of the Mud

Here are the details of a great constructive highway program, well worthy of the big northwest commonwealth and which might well be emulated by every state in the Union. What about your state?

Saw First Gold in California!

As interesting reminiscence as we have read in some time, as related by the last person alive who saw the first gold of the great store that Nature yielded to the sturdy pioneers of '49.

"Interestingly Informative!"

From the Mail Bag

DETROIT, MICH.—Your weekly has a splendid message full of courage and seems to be backed up with honest convictions, touching on things that apparently have a very close relationship to some of our present troubles.

EDGERTON, WIS.—The Dearborn Independent contains much condensed, interesting and useful information that I do not find in any other newspaper that I happen to be a reader of.

BELTON, TEX.—It is bubbling over with just such information as I have always wanted and could never find.

CARLISLE, PA.—. . . and we consider it one of the most attractive and original magazines in our reading room.

MINNEAPOLIS, MINN.—Your paper is very clean cut, very instructive and educational and it certainly reveals some things to the writer which have opened his eyes.

BEREA, OHIO.—I must congratulate you on your effort in publishing a most interesting and instructive journal and one I greatly enjoy reading.

MILWAUKEE, WIS.—To try to get along without it now would not be so easy, as my daughters look forward to its coming each week for the valuable information they get from it for their school work, and I generally have a Dearborn Independent in my grip when starting out on my week's work.

No present would be so appreciated as fifty-two issues of THE DEARBORN INDEPENDENT during 1921. Subscribe now for a number of your friends.

Permanent features that go to make THE DEARBORN INDEPENDENT unique among American publications:

MR. FORD'S PAGE

Invented Wireless Before Marconi Was Born

If Congress had been sincere and newspapers hadn't jeered, the life work of a Washington dentist would have entitled him to a niche in History's Hall of Fame —but Fate ordained otherwise.

The Farmer as a National Legislative Lobbyist

Two-thirds of the farmers of the United States are behind movement to ask Congress for amendment to anti-trust laws which will make collective marketing legal.

He Is an Artist of the Films

Motion pictures, as several of the charming little stories recently written by John B. Wallace for The Dearborn Independent reveal, are developing queer and little-heard-of side lines worth telling about.

Many Men of Many Minds

Reginald McKenna.—In almost every country excessive government expenditure is the main factor in forcing up prices. Many states are compelled by insufficiency of their revenues to borrow, and in their case harm is done which is apparent to everyone. But then, when governments meet their expenditures, however great they may be, by taxation, there is a current belief that the whole duty of man has been fulfilled. This belief is a profound delusion. Very heavy taxation will, I maintain, affect production injuriously, reduce purchasing power and raise the velocity of expenditure, and for all three reasons will tend to drive up prices.

Stephen Lausanne.—If the nations really meant what their delegates have said in flowery speeches they would immediately say: "Let us all agree at once to stop building expensive dreadnaughts and heavier warships and conform to a naval program for lighter vessels." They would agree to cease construction of heavy artillery which is unnecessary for police purposes inside their borders. I think the United States would agree to such a program, as well as to immediate stoppage of the use of poison gas. Until the League of Nations assembly registers sincerity in this big international problem the world will have no faith in the League.

Yes, If Nations Really Meant What They Said

David Lloyd George.—Make Germany pay all she can. The amount should be fixed. I was a lawyer before entering politics and when I confronted a debtor I had two courses to choose, either to enforce strictly the rights of my client, and sell the debtor's house and furniture at the risk of getting nothing or next to nothing, or saying to him: "You owe so much. How much can you pay at once? How much in a year, or ten years?" This latter method I found to be best and this I advise following in dealing with Germany.

Monsignor Bonaventure Ceretti.—The Roman Catholic church has always condemned divorce and continues to combat it both from the pulpit and in various papal allocations dealing with the sanctity of marriage and family ties.

Dr. Edward E. Pratt.—Our export business has borne the brunt of the reducing process that was inaugurated by the Federal Reserve Board more than a year ago. At the present moment, export business has almost entirely ceased, cancellations of orders previously placed are pouring in and drafts on merchandise already sent out are being refused and dishonored in foreign countries.

W. C. Teagle.—The American petroleum industry must look to the development of production outside the United States to supplement the supply from domestic fields. Domestic crude is not sufficient even for current home needs, and it is absolutely imperative that American petroleum producers proceed actively and intelligently to develop oil resources in foreign lands.

Edwin A. Alderman.—The imagination and grasp that have made American industrial enterprise one of the wonders of the modern world, should find their counterpart in the treatment of the educational problem. The very best minds of the nation have got to focus themselves upon it. Owing to the operation of great cosmic forces, it is now the manifest destiny of America to take the lead in the education of the world. Let us have faith that America will not fail to prove itself worthy of this vast obligation in the new epoch which it is called upon to serve.

U. S. Must Take Lead in Educating World, He Believes

Sir Philip Gibbs.—There is only one cure for the woes of Europe and our own—not easy, but bound to come unless we are looking for downfall. It is the reconciliation of peoples, burying of old hatchets, wiping out of old villainies and co-operating in a much closer union of mutual help under the direction of a league of nations, made democratic and powerful by the free consent and ardent impulses of the common folk.

Lord Robert Cecil.—It moves, it is doing things, the League lives, it has already proved its practical value, it will accomplish much, it will prove indispensable to the world. It will be the fault of the peoples if they do not, by faith and insistence on the use of the League, make of it a great instrument of peace.

Daniel Willard.—The United States is rich in natural resources, some parts being especially adapted for cheap production of grain, other parts for coal, ore, and so on, and owing to our free trade policy among the states we procure to a large extent our flour, meats, fuel, cotton, wool and innumerable other articles where they can be produced at lowest initial cost, and then by what has been usually an efficient and adequate system of rail transportation move them to the place of ultimate consumption, the difference in initial cost being so great that the added cost of transportation is very much more than offset.

President Dartiguenave, of Haiti.—The American civil administration in Haiti is more oppressive than the military.

Herbert Hoover.—We have just passed through a period of unparalleled speculation, extravagance and waste. We shall now not only reap its inevitable harvest of unemployment and readjustment, but we shall feel the real effect of four years of world destruction, and its economic and social problems will stand out in vivid disputation. One of the greatest conflicts rumbling up in the distance is that between the employer on one side and organized labor on the other. Probably the tendency to domination exists among the extremists on both sides. There are certain areas of conflict of interest, but there is between these groups a far greater area of common interest, and if we could find measures by which, through co-operation, the field of common interest could be organized, the area of conflict could be in the largest degree eliminated.

Luella A. Palmer.—I often wonder if mother realizes what that last kiss and tender pat means to a child as she tucks him into bed. Perhaps the caress would be given oftener and with added gentleness if she knew what an influence it had upon the unfolding of a little new life. Over and over the brain repeats during the night the events of the day, twisting them into fantastic shapes. These ideas float through the mind of the child for eight to ten hours out of the twenty-four—during one-third to one-half of his life. Whether the fancies will be happy or sad is often determined by the last half hour before sleep begins. And the repetition of the ideas influences a child's temperament, making it more cheerful or pessimistic.

Last Kiss at Night Means Much to Growing Child

Mrs. E. E. Remsberg, sister of President-elect Harding.—All Warren's pals that helped him on the paper are not to be forgotten just because he has been elected president. I expect mother's teachings will continue to dominate him. Warren is conservative—always has been even when a boy. And he never loses his temper. He's calm, deliberate and poised. He is not afraid to stick by his principles, either, and he's a hard worker.

A. A. Nelidow.—The enormous natural wealth of Siberia is well known. Wheat, flax, hides, bristles and furs are among the many raw materials available for export. Coal, gold, platinum, copper and precious stones offer most wonderful opportunities for mining. At the same time there is an almost unlimited demand for all sorts of machinery—mining, farming and other hardware, every description of dry goods, drugs and chemicals, household and wearing apparel and other manufactured goods.

President-elect Harding.—The big thing for all America to realize now and always is the dignity of productive labor. No matter how humble, the producers are the makers of the essentials of civilization and we must each and all of us accept and discharge our duty of producing for the world or of ministering to the needs of comfort or progress of mankind.

Bainbridge Colby.—The government of the United States has consistently urged that it is of utmost importance to the future peace of the world that alien territory transferred as a result of the war with the central powers should be held and administered in such a way as to assure equal treatment to commerce and to citizens of all nations.

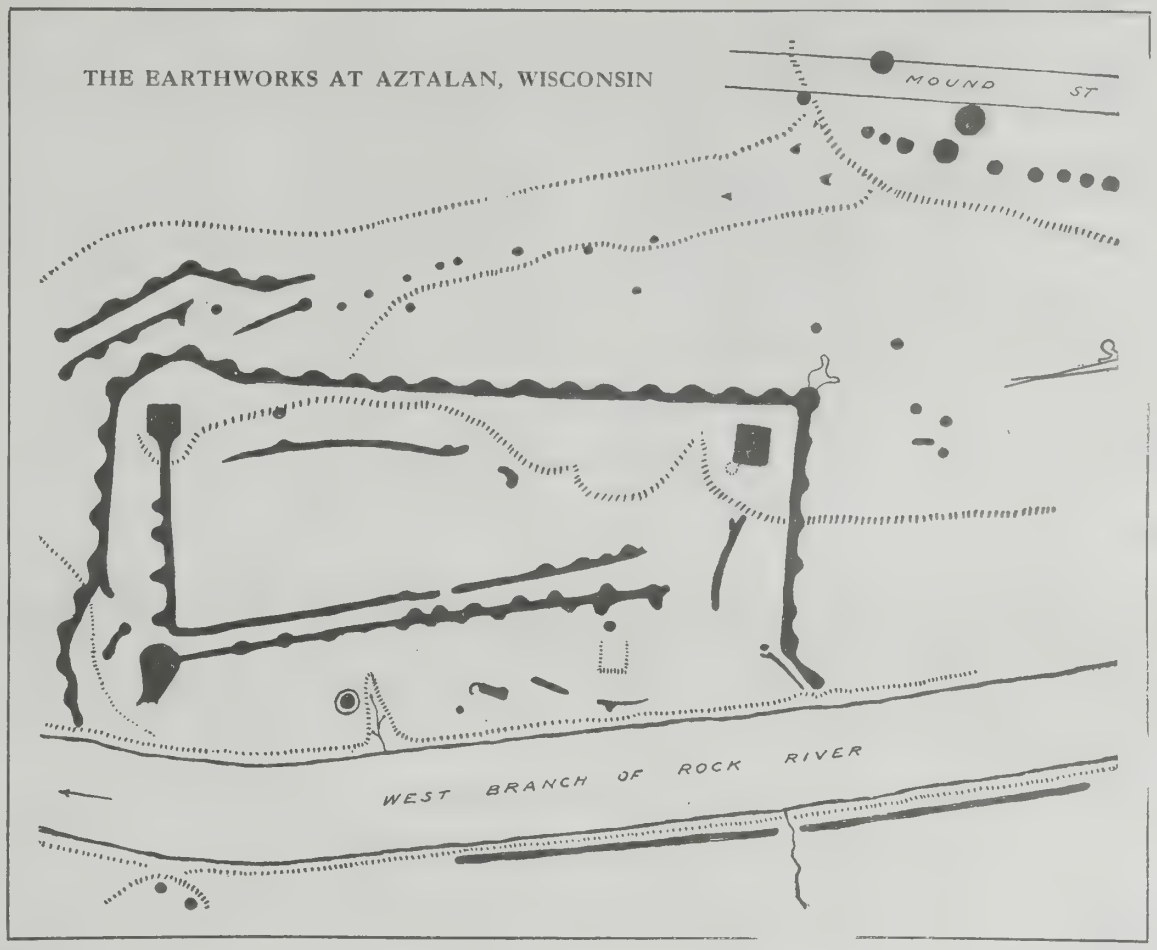
E. R. Johnson.—I do not believe America will have a panic with the slump in prices that is inevitable and one does not necessarily follow the other. When prices reach a normal basis then the people will begin buying.

Edwin T. Meredith.—The products of the farm—worth last year $25,000,000,000—constitute the bedrock basis of American business. Manufacturers receive from them directly or indirectly the materials that go to make up their finished products. The banker employs his deposits in facilitating the exchange of products between the farmer and the manufacturer. The railroads and other transportation agencies carry the output of the farms from one to the other. Of the wares on the merchant's shelves many are the products of the farm, and of many others the farmer is the largest purchaser. Is the business man interested in whether the farmer operates at a profit or not? The one answer to that is this: If the business man is not interested in himself, in the success of his enterprises, in the profit that he hopes to take from it, in the comforts and conveniences that he intends to provide for himself and for his wife and children, then he is most deeply and vitally interested in doing everything possible to see that the farmer has a fair opportunity to conduct his enterprise on a profitable basis. He is interested—or should be interested—in making sure that the farmer gets a square deal, that his products, when they are sold, find an open, free, remunerative market.

Square Deal for Farmer Should Be Merchant's Aim

Thomas Lipton.—My view is that every man who feels he has, or can get, the equipment to meet a bigger market should go to the bigger market. That's the advice I give to every friend of mine who puts the question to me. There's no mystery in foreign trade. In some respects it is often found easier and less risky than selling in your own home market. Every big American ought to get into the foreign field.

W. L. McKenzie King.—Human nature does not change when men become members of boards of directors, or sit in conclaves or cabinets. An autocratic man will be a tyrant, whether he be an emperor, the manager of an industrial corporation, or the leader of a labor organization. Unfortunately, evil forces, like beneficent ones, expand. Control becomes increasingly powerful as the area of its authority widens.



Charles H. Kayser.—The loss by useless but preventable fire has now reached the enormous sum of $300,000,000 and more than 15,000 lives a year in the United States.

Howard Elliot.—In my judgment we cannot get on our feet unless everybody is willing to co-operate with everybody else. I think that so far as possible there should be a sinking of self, and that large enterprises should avoid even the appearance of evil and of so-called "profiteering." There has been enough of that to make the public feel that the so-called well-to-do have been getting an undue share. This, of course, is not true except in a few cases, but that impression is abroad and is doing harm.

Shun Profiteering Suggestion of Railroad Man

H. E. Coffey.—Discontent and dissatisfaction are growing among the farmers as never before; and there is a reason for it. The increased price of farm products has not been proportional to the increased cost of production, and the farmer is awakening to the inequalities and injustice of our day. The reports of the Department of Agriculture indicate that the average income of the American farmer is less than one-half of the average wage received by a carpenter, bricklayer, or any other organized city trade.

Aztalan—Indian Babylon on the Mississippi

By FRED L. HOLMES

THE great prehistoric capital of the Upper Mississippi Valley—now a disappearing earthwork inclosure of crumbling walls and ceremonial mounds—is being upturned by the spade of the scientist and investigator. It was a weird and mystic place to spend a day's outing.

To determine whatever of archeological knowledge might be hidden in these great prehistoric ruins the Milwaukee public museum began a course of extensive excavations and study early in the summer this year and although these investigations are still in progress so many discoveries of interest were made that the Wisconsin Archeological Society and the State Historical Society recently made a joint pilgrimage to the place and spent a day visiting the ruins under the direction of the scientists at work.

As the excavations progress and one truth is piled upon another belief becomes an established fact that at Aztalan, Wisconsin, there once gathered at this ceremonial mecca, Indian tribes from the entire Northwest—perhaps as our ancestors crowded in crusades to the Holy Land. Here their greatest Upper Mississippi Valley earthworks were built, basketful of earth upon basketful from the surrounding fields, almost the task of an age when such simple methods of transportation must be utilized; here center all the old Indian trails to other localities; here are still to be found unmistakable evidences of courtly scenes and inspiring religious ceremonials and gruesome evidence of human sacrifices—probably war captives were boiled in kettles, devoured in canabalistic fashion and their broken bones heaped in the camp refuse with those of fish and animals.

For eighty years Aztalan has been a strange name to conjure with. It was named by its first discoverer, who believed that it must have been a deserted village of the Aztecs. In 1838 it lacked only two votes of being chosen as the capital seat of Wisconsin. Then came Increase A. Lapham, scientist, father of the weather bureau, and with chain and compass gathered some of the material facts about Aztalan which when published made the deserted village famous even in Europe as among the western world's antiquities. It is said that until recently scholars in foreign countries have actually shown more interest in the Aztalan mounds than people of Wisconsin themselves. The late Professor James D. Butler, of the University of Wisconsin, in a series of historical articles refers to the fact that when traveling in Europe he met more inquiries regarding Wisconsin's greatest aboriginal ruin than he met in his own state.

Like the more famous Indian earthworks, the establishment at Aztalan was erected on a beautiful water scene. The main inclosure was a huge parallelogram, with the Rock River as one of its sides. The north wall was 631 feet; the west, opposite the river, 1,419 feet and the south 703 feet—a field of nearly eighteen acres. The wall width is given as more than 22 feet and the height from one to five feet. Along the outer edge of its entire length were rounded projections which have been frequently referred to as "buttresses or bastions" but which scientists have since determined "were never designed for either of the purposes indicated by these names."

Inside the inclosure, within the northwest and southwest angles, were two flat-topped rectangular, truncated, pyramidal mounds, the level tops measuring from 60 to 65 feet.

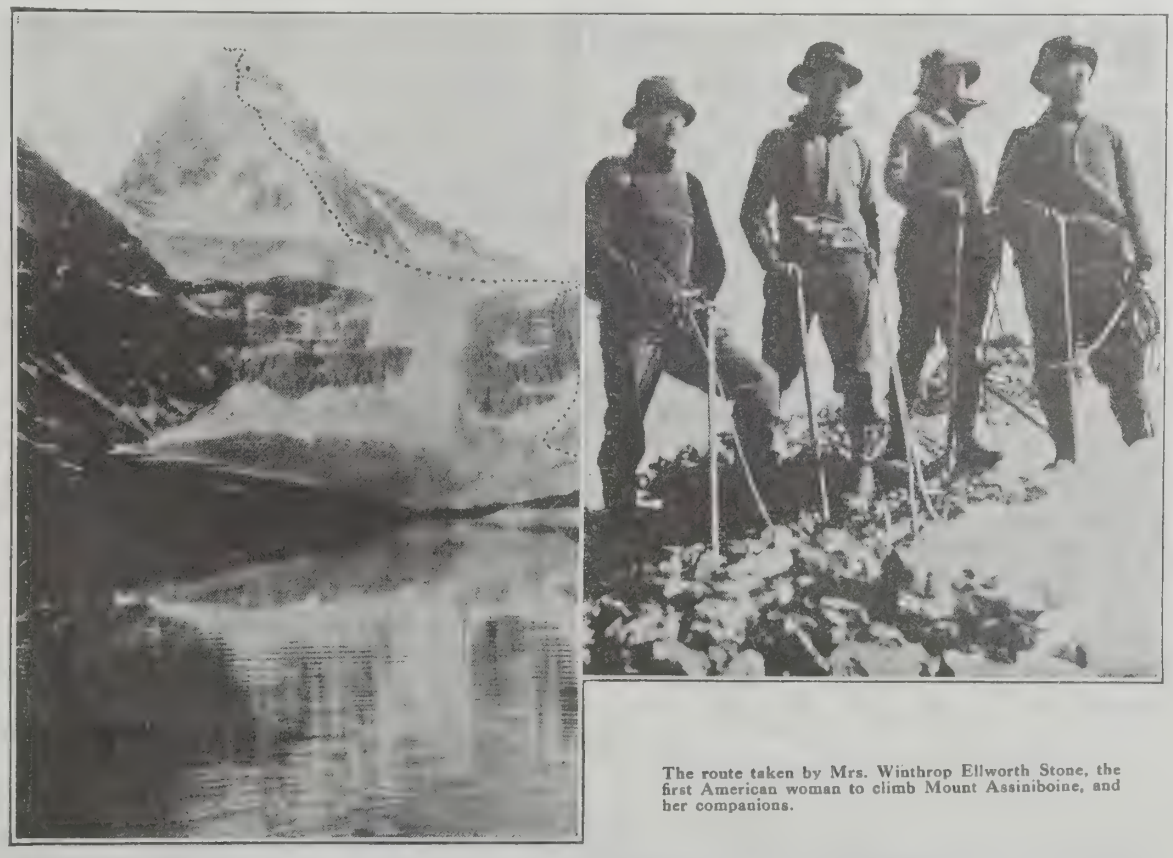
"Also within were a number of excavations, besides conical mounds, embankments and other earthworks, some of which our present knowledge enables us to identify as very probably effigy or emblematic mounds," says C. E. Brown, secretary of the Wisconsin Archeological Society.

Outside the inclosure were originally 74 mounds and a number of embankments, all located on the west bank of the river, while on the east bank of the river were formerly two long embankments, two small inclosures, and twenty-two mounds. All these were apparently directly connected with the inclosure and the whole together formed a unique but one of the largest and one of the most important of the many ancient earthworks of America.

"What was Aztalan?" was the question put to Dr. S. A. Barrett, curator of anthropology, head of the scientific investigation for the Milwaukee museum. We were then standing on the top of the ridge looking across the valley, below us were the ruins of the ancient village, its outline still visible although plowed for 70 years. Broad stubble fields, acres of corn, herds of sleek cattle grazing on the hillsides spread before us. The investigator paused for a moment, as if breaking the mystic spell which attached him to the ancient past.

"Aztalan is still a beautiful place," said Dr. Barrett. "We find that this was a great ceremonial establishment whose mounds and pyramids supported tall ceremonial poles, doubtless bedecked with emblems of symbolic significance. The walls perhaps served as ways for processionals and may have been also adorned with temporary decorations, of which no traces now remain. Certain it is that these walls never served as works of defense and that Aztalan was never a fortified town.

"The ancient inhabitants of Aztalan possessed a relatively high culture as is shown especially by their pottery. Vessels of various beautiful forms ornamented with many different patterns in incised, modeled and painted decoration have been found in the old village site. Though broken and left just as these ancient people used them they are still works of art of no mean merit and show the highest expression of the artistic sense of the former inhabitants of Aztalan. Of special importance in the present work is the fact that these potsherds show characteristic features of three widely distributed peoples, indicating that Aztalan was at one time a center of no small importance.



"The far-famed 'bricks' of Aztalan were irregular masses of clay mixed with grass and then burned possibly in connection with ceremonial offerings in some instances. One instance has been found in which this clay was employed in the making of a rude fireplace.

"That canabalism was practiced by the builders of these earthworks is clearly shown by the presence, in numerous instances, of portions of human skeletons and more especially of the fragments of human bones cracked for the marrow, in the refuse heaps of the village and about the camp fires. These are associated with the cracked bones of various kinds of animals and with the bones of birds and fish, and with all kinds of other kitchen refuse showing that they were undoubtedly treated in exactly the same manner as was the refuse of any other kind of food. The victims were doubtless captives of war sacrificed in connection with the ceremonies which were probably the real center of the life of the ancient Aztalan."

After a careful consideration of all the facts available from former work and of the results of the present excavations it seems entirely unlikely that this inclosure was intended by its builders as a fortification or even that it was a palisaded town. It seems most likely that it was a great ceremonial establishment, possibly the resort of devotees from considerable distances. Such an inclosure with its pyramids, embankments and mounds within and with the large number of mounds and other earthworks without must certainly have presented an imposing spectacle during one of its elaborate, ritualistic ceremonies with hundreds and perhaps thousands of religious devotees assembled for worship. The best evidence indicates that it was the capital of the Siouxan tribes of which the Dakota and Winnebago are descendants.

The permanent preservation of what now remains of Aztalan is being urged upon the state by both the Wisconsin State Historical Society and the Wisconsin Archeological Society. Being located on a main-traveled road between Madison and Milwaukee it would be, if inclosed in a small state park, visited by thousands of citizens and tourists every year.

Back to earthly levels the famous Indian ceremonial grounds are returning, and beside Aztalan another village, one of the first to be established by the white man in Southern Wisconsin, is going to decay. Gone are the four hotels of modern Aztalan, the wagon works, the homes and only a half dozen empty buildings and walls charred by fire stand like sentinels. The ruins of two civilizations are passing fast to oblivion.

The route taken by Mrs. Winthrop Ellworth Stone, the first American woman to climb Mount Assiniboine, and her companions.

These photographs just received show the remarkable record-breaking climb up the steepest and highest peak of the Canadian Rockies, 11,860 feet above sea level, of Mrs. Winthrop Ellworth Stone, wife of the president of Purdue University. Because of its inaccessibility as well as the difficulties which it offers the mountain has only been climbed a few times by men. In the party of four was Dr. Stone, the quartet making the climb in six and one-quarter hours.

Colonel House on Silence

WHETHER one be a friend or a foe of the League of Nations he cannot help being somewhat amazed at a statement from Colonel E. M. House, President Wilson's confidential advisor, that open diplomacy is vital to the success of the League and that unless the tribunal will agree to keep the peoples of all nations informed of the direction in which they are being led, its chances for doing any great good will be greatly lessened.

That statement, true as it is, sounds rather strange, coming from the man who probably had more influence with Mr. Wilson at the Peace Conference than any other individual or set of individuals and yet, as far as can be ascertained, did nothing to make good the promise of "open covenants openly arrived at."

One imagines the statesmen of Europe, who know Colonel House and his methods of handling diplomatic affairs, will chuckle right heartily at being scolded for the sin of silence in diplomatic matters by a man who has been one of the most conspicuous offenders.

If Colonel House is in earnest, one wonders why there was not less secrecy at Versailles and Paris. And one cannot help meditating upon the fact that if the policy which the President's advisor now preaches had been put into practice in 1919 the League of Nations might have met the hopes of the world in a far more complete sense than it is meeting them today.

The colonel's conversion is a bit late. The meeting is all over.

Get Them, Judge

APPOINTMENT of Judge Kenesaw Mountain Landis, he of $29,000,000 Standard Oil fame, as the supreme arbiter in major league baseball, insures a square deal for the public.

If the owners of major league parks had not acted as they did, as promptly as they did, the scandals that have cropped up during the past season might well have closed their gates within another year.

And yet that last statement perhaps must be modified somewhat, for the people notoriously are quick to forget, as witness even now their having been lulled to sleep following the indictment in Chicago of the unfortunate players who succumbed to the temptation of great sums of "easy money." At the time there was promise that *all* the guilty would be dealt with as summarily as were the players, but the stigma of exposure has fallen only upon the weak ones. Those who initiated the scheme, those who were responsible for its successful carrying through, seemingly have escaped unscathed. They are of the same type as the Broadway "bank roll men" who back the gambling houses of New York City, participate in organized crime, and are responsible for commercialized vice.

It is to be hoped that the new chief of baseball will devote his attention to such as these, for without their permanent elimination from baseball, the menace is dissipated but for the moment.

Spank Him

THE world some few months ago thrilled at the daring of one Gabriel D'Annunzio, who with an enviable war record as a flyer in the Italian Army, had recruited a legion and with it had seized Fiume, a port in the Adriatic that promised difficulties if indeed did not bring war between Italy and the newly-created Jugo-Slavia.

D'Annunzio was not unknown to the world then; as a poet he had stirred Italy to break its neutrality and enter the war as an ally of the Entente. During the dark days his words had inspired his gallant comrades to greater deeds of valor. Came the armistice, the Peace Treaty, and following these, the sudden dash of D'Annunzio and his adventuring force.

People paused in their discussion of the high cost of living to pay a few words of tribute to the poet-aviator. His manifestoes, his defiances, rang with phrases that stirred the sluggish blood even in the far-off corners where time hangs heavily and the cracker barrel and drum stove furnish the attractiveness that draws men.

But time went on and with its passing came a moderation in the discussion of the claims and counter-claims in respect to the status of Fiume. Statesmen of the interested countries got together and settled the question satisfactorily to both parties. But moderation did not fit in with the D'Annunzio program. The reason? It called for his removal from the center of the stage; the spotlight would be upon others.

So now we have revealed a man of ordinary clay and it is this ordinary clay that makes of him a common scold, breathing words of impotence, dangerous only because there are those who still worship the idol they set up from earlier words.

The Italian Government, its troubles so many, should waste no time upon him. If there are those who refuse to obey its commands, they too must suffer the consequences. But have done with D'Annunzio—there are too many serious problems to occupy the world's attention.

Let's Forget Politics

SENATOR ARTHUR CAPPER, of Kansas, who devotes most of his time in Congress to championing the cause of the farmers and does it very ably, is reported to have declared the Republican party must give considerable attention to the needs of the farm if it expects to be kept in power at the next congressional elections. Senator Capper chooses a rather unhappy way of expressing the matter, for he makes it appear a matter of votes whereas it should be nothing of the kind. If the Republican party approaches the problem of farm legislation with such a motive it can be written right now that the legislation which results will be of questionable value. Laws that are written to capture the votes of one class usually infringe on the rights of other classes.

The farmers have a long legislative program ready to present but there is no indication that they are preparing to attempt to win favorable consideration by threatening Congress with their ballots. On the other hand the farmers' organizations are sparing no efforts to prepare their case so that it will be understood by Congress and the public and the justice of their requests recognized.

There is no doubt that considerable farm legislation is needed. Nor is there any doubt that a great deal of attention will be given to the subject by the next Congress. But it should not be pure class legislation and that is what it is apt to be if the motive is votes rather than justice and common sense.

Ponzi

THE conviction of Ponzi, Boston's financial faker, on one of the several charges against him, was expected and has caused but little comment. When the "wizard," as thousands called him, went to jail and stayed there, the blind faith of the multitudes vanished. Nothing discredits a wizard so much as being kept in jail.

The experience of thousands of honest people who lost their savings in Mr. Ponzi's scheme should serve to discourage the promotion of any more such get-rich-quick fakes for a time at least. Eventually, of course, there will be another glib individual with a new way of promising something for nothing, but for the present, perhaps, gentry of this type will find the pickings rather hard.

A review of the whole course of the Ponzi case, however, will show that the state and Federal authorities are partially to blame for the magnitude of his operations. He was allowed to do business wholly unmolested for months and during all that time the gold of the trusting depositors was flowing across his counter in a steady stream.

It would have been just as easy to have ordered Ponzi to suspend operations during the first month that he was in business as it was to do so after he had been accepting deposits for nine months. And such an order would have saved hundreds of thousands of dollars to the people of Boston and vicinity.

Having disposed of Ponzi, would it not be well to inquire into the negligence of the officials who are supposed to protect the public from such adventurers?

Give Them a Chance

THE story is told of President Lincoln who, while walking one day in the park with a friend, turned back for some distance to assist a beetle which had gotten upon its back, and lay upon the walk with its legs sprawling and kicking, vainly trying to turn itself over. The President righted it, and the beetle scurried off into the shrubbery. The friend expressed surprise that the President, burdened as he was at that time with the cares of the Civil War, should find time to spare to assist a bug.

"Well," said Lincoln, a smile lighting up his homely face and making it almost beautiful, "do you know if I had left that bug struggling there on his back, I wouldn't have felt just right. I wanted to put him on his feet and give him an equal chance with all the other bugs of his class."

It was this trait in Lincoln's character—the wanting to give everybody an equal chance—that endeared him to millions of his countrymen.

There are many people in this world who have not an equal chance with their fellows to lead a clean and honest life. They begin with a millstone around their necks. From their birth, their training is neglected, their opportunity to forge ahead is menaced by their surroundings, their ambitions have never been aroused, and their whole chance of advancement is limited by reason of this unequal start.

The boy, born amid squalid surroundings, of sinister parentage, and allowed to grow up without a word of counsel or encouragement as to how he should proceed to make a man of himself, has not an equal chance with those who are born into more favorable conditions of life.

The girl, whose bringing up has been nil, whose playground is the street, and whose companions the product of the same strata of society to which she herself belongs, when she reaches the time when the womanhood within her—crushed and stifled and almost smothered, perhaps, but still there—yearns for something better than the life she is then living, often finds that she has not the moral stamina to breast the eddies and cross-currents which beset her in her battle against the winds of adversity. She goes down with the tide because she never had an equal chance with others who, with stronger wills and a better knowledge of life, succeeded where she failed.

The young man, because of the lack of early training to rely upon his own efforts, when suddenly thrown upon his own resources is at a disadvantage in the marts of business, and is likely to go down under the swirling rush of modern commercial life.

Many a young woman who had been taught to think only of self and pleasure and enjoyment, and to give no thought to the practical things of life, has stood aghast when wealth has taken wings, and the necessity for work confronted her.

And all this because the majority of men and women will not turn back in their mad onward rush for wealth, pleasure or happiness, to assist the fallen one to regain his feet once more.

Take a little time, and see if you cannot help some one less fortunate than yourself. Let your interest go out to those who are struggling against circumstances which have bound them down through no fault of their own, and see if you cannot make things a little less hard for them.

Put out your hand, and raise a fellow being who has fallen to his feet once more, and give him an equal chance with others of his class.

Remember how President Lincoln, amid the cares and worries which were pressing upon him with almost overwhelming force, stopped long enough to assist a bug to its feet again. Go out of your way the next time you see a person who has fallen, and raise him to his feet. Give him a chance in the race of life, once more, and see if you do not feel happier than you ever have been before, because of your act.

Action Needed

IT IS well that the authorities are stirring to the menace of unrestricted immigration that has been and is flooding into the country through Ellis Island. The inquiries instituted reveal that millions are awaiting passage at the Baltic ports and these millions for the most part have been characterized as a low-grade type of immigrant, non-producers, diseased, illiterate.

We know, of course, that there is a place in the United States for the desirable immigrant. He is welcome and will readily find his niche in the scheme of things. But there must be discrimination. The bars must be up, firmly in place, against those whose destructive tendencies will not permit them to enter into the spirit of free America.

Let us have action before the flood becomes a tidal wave threatening engulfment.

Mr. Ford's Page

AT BOTTOM, nothing much matters in social affairs except the way in which men treat one another. Everything else swings around this. There may be scarcity or there may be plenty, but if the relations between men are full of confidence, if the sense of unity and reliability is broadcast among men, more than half the occasion for anxiety is removed. But though there be peace in the land and plenty everywhere, if there is not human concord, all material blessings are robbed of more than half their worth.

It is a great shock when the mind awakens to the fact that not all of humanity is human, that is, that whole groups of people do not regard others with humane feeling. Great efforts have been made to have this appear as the attitude of a class, but it is really the attitude of all "classes," in so far as they are swayed by the false notion of "classes." Before, when it was the constant effort of propaganda to make the people believe that it was only the "rich" who were without humane feelings, the opinion became general that among the "poor" the humane virtues flourished.

But the "rich" and the "poor" are both very small minorities, and you cannot classify society under these heads. There are not enough "rich" and there are not enough "poor" to serve that purpose. Rich men have become poor without changing their natures, and poor men have become rich, but the problem has been very little affected by it.

Between these two is the great mass of the people who are neither rich nor poor, and who never will be, for the reason that a society of millionaires would be bound to raise wheat and bake bread and make machinery and run trains if they were to have anything to live on, just as the present society has to do. And they will never be poor for the reason that they are willing to do their part in the world.

It is these people—the people—who give tone to the world. The press in its society columns may sometimes give the impression that the well-to-do are the important people, and the agitator may give the impression that the impoverished constitute the important element in the world. But both are minute sections of society; those who make the world go round, who give the flavor which social life possesses, are the masses who make up the great whole of the people.

No one can oppress the masses but themselves, and they do this by forgetting their oneness. Take it in industrial management, for example. With the best will in the world the head of a concern may adopt a policy of fair-dealing with men as individuals, only to find afterward that all down the line that policy has been wrecked by the bad temper or ill judgment of employes on whom the policy was dependent for its success. It was not the employer who created the unfair conditions, it was the employes. The relations between men in the shop are often more oppressive, more destructive of freedom and happiness in work, than are the relations between the managerial and the operative forces.

Until we begin to think of each other in our total relations as human beings, and get rid of the notion that the basis of our relations are coldly economic instead of warmly human, there is bound to be inner friction. And it is this inner friction that accounts for most of the anxiety and unhappiness of our everyday life.

It is time to utter a warning word both to employers and employes who consider themselves opposing forces, and who take advantage of "economic" changes to push the fight one against the other.

Just let your mind pass back to conditions in the United States at the beginning of the year. Labor was scarce then. Men threw up their jobs on the slightest pretext because they knew they could have their choice of five or six other jobs. There was a competitive bidding for men among some of the industries. Changes were so frequent and the per capita production slumped so seriously, that anyone who knew anything at all knew that the time would inevitably come when those things would have to be paid for.

At that time, those who nurture the idea of "industrial war" as the normal condition between employer and employe were rather jubilant because they had the upper hand. Their tone was: "Now we have got the bosses where they have got to come to us; we can do with them what we like."

It was not wise, it was not humane; it was industrially suicidal. Worst of all, it revealed in a flash how little we really know about our relations one with another.

The time came when for all this carelessness everybody had to pay. And everybody is paying a little bit now. You cannot fling flour broadcast and expect the barrel to hold out for the baking, and you cannot fling time and material wages away and expect business to go on supporting that kind of thing. Indeed, society itself cannot support that system of things, and that is where the day of judgment dawns for such things—in society itself.

But now what do we see? Why, we see certain employers adopting precisely the same attitude and showing precisely the same temper as characterized the thoughtless workman earlier in the year. We see and hear signs of a thought like this: "The tide has turned; it is our innings now; we have got the workers where they will have to meet our terms."

It only needs to be stated thus baldly to enable everyone to see how wrong it all is.

It is a very great mistake, and it only goes to show how foolish we all are together.

There is no such thing as "getting even" in this way. Nobody ever "gets even" anyway; only nature and the moral law have control of the evening up process, and this process arises because all of us in our human relations have gone out of line.

When you try to "even the score," you only double it. The old law of "an eye for an eye, and a tooth for a tooth" meant, at the very best, two eyes instead of one, two teeth instead of one—*doubling* the evil instead of curing it.

The situation seems to be that, because of human folly in months past, natural law is now operating to bring matters back into equilibrium. But if, on account of this process, another portion of the industrial organization undertakes to have its little fling too, then it only means that natural law will have to come back again and, by another painful operation, restore the damage done by the second folly.

All of these matters are within human control. From the war and its antecedents, to all the consequences thereof, nothing has been inevitable in the absolute sense; all has originated in the human will unwisely directed. If now human will and wisdom were directed in co-operation with the law of right relations, not only would the restorative process be comparatively brief, but there would be no relapses.

If any party gets the idea that now is *its* innings, then another party will strive hard for its innings again, and the consequence will be that the law of right relations will be constantly halting, checking and penalizing us. We are free to go as far as we like, but we are foolish to use that freedom to our own hurt or to the hurt of society at large. And free as we are, we are absolutely bound by the law that no one can prosper unless all prosper, and no one can suffer unless all suffer. Society is a living organism, and no system of capitalism can say, "We will feed the head and starve the hands," and no system of socialism can say, "We will feed the hands and starve the head," for whichever course you take of this character, all you succeed in doing is starving the whole social body.

Surely we have gone through enough to make us wiser than some present-day talk indicates.

THE highest human privilege is to learn. We are learning now that what we did last spring when jobs were plentiful was wrong. Whenever we do anything wrong, Nature holds court and assesses damages. Workmen said: "We have got the bosses where we want them;" they quit on any pretext; per capita production decreased. We should have learned something, for the consequences were not long in coming. But no; we now hear the same thing from some employers: "The tide is turned; the workmen will have to come to our terms." This is not "getting even"; it is doubling the evil. Why match one folly by another? Natural law will as quickly penalize society for the unwise employer as for the unwise employe. There are no "classes"; there is only human society. We prosper or suffer together. Let us be wise.

People Pulling Minnesota Out of the Mud

Approve Construction of Trunk Highway System of 7,000 Miles

By EARL CHRISTMAS

PULLING Minnesota out of the mud is the new job undertaken by the people of that state. And it's going to be a real accomplishment. This doesn't mean that Minnesota roads are worse than those of other states. It does mean they are going to be a whole lot better.

Establishing a state trunk highway system of 7,000 miles, approved in the form of a constitutional amendment at the recent general election, Minnesota has launched into a program designed to place it in first rank among states with good roads.

The Minnesota program, known as the Babcock plan, contemplates improvement and maintenance of this vast trunk system of arterial roads by the state through a license tax on automobiles.

Removing from counties and townships the burden of building and maintaining these arterial highways, the plan will release, according to highway engineers, enough local funds to build 21,850 miles of graveled connecting roads in ten years. In other words, at the end of ten years, Minnesota can have under the amendment, 28,850 miles of improved highways, constructed without increasing road taxes and with only the additional funds from the state license tax on automobiles.

The Babcock plan—so called from its author, C. M. Babcock, commissioner of highways in Minnesota—isn't just a plan. It is an accomplished fact.

The Minnesota legislature approved the project with but ten dissenting votes in the two houses. Submission of the bill to the people as an amendment to the state constitution was necessary, however, to enable the state to engage in building roads and to enable it to use funds from a license tax on automobiles for this purpose.

Though state good roads projects frequently fall by the wayside in general elections, the Minnesota project was approved by a large majority, almost three persons voting for it to one who opposed it. It remains only for the legislature to pass a law under this authorization providing for the license tax.

An average of $18 a car has been suggested as the license fee to be charged. With a registration of 300,000 motor vehicles, this will provide revenue of more than $5,000,000 a year, enough to build and maintain the trunk highway system of 7,000 miles. This, however, will be determined by the legislature.

Owners of motor vehicles, though their fees will be increased, will get back their money threefold in saving in the cost of operation of their cars. At least, that was the promise of the state highway department, and the motorists were the most enthusiastic boosters for the project. The license tax, which is to be graduated to the size of the car, is to be in lieu of other taxes on automobiles.

Though it required the formality of a constitutional amendment to legalize it, the Babcock plan long ago started to function.

Already, 3,000 miles of permanent grading has been done on this 7,000-mile system. Two thousand miles of road have been gravel surfaced. More than a hundred miles have been paved, and two-thirds of the bridges and culverts have been put in. County officials in Minnesota were sure the people of Minnesota wanted good roads. So sure were they, that the counties in the last two years went ahead and improved vast stretches of road at their own expense, confident they would be reimbursed under a provision of the bill arranging for this in case the amendment passed. Minnesota counties in the last two years, according to estimates by the state highway department, have spent $16,000,000 in permanent road improvements, subject to refund under the amendment.

That's how much faith Minnesota counties had in the Babcock plan and the people of Minnesota.

During the present year, in spite of high prices of materials, Minnesota counties have done 1,800 miles of permanent grading, said J. H. Mullen, deputy commissioner of highways. Graveling accomplished during the year, he put at 1,100 miles of roads, and paving at 100 miles. But two other states in the union—Illinois and Pennsylvania — can compare with that record.

Plans for all this work have been drawn up by the state highway department, and the work has been done under the direction of the department.

The state highway department, under Commissioner Babcock, has assumed the job of traffic director for the state.

Ever since 1916, the department has been studying the traffic on Minnesota roads. Mr. Babcock and his engineers found out what roads carried the heaviest burdens. He took a statewide traffic census, and repeated it from year to year. Then on the basis of these findings, he started to work mapping out a state trunk highway system, seeking to put on this system the main, or arterial roads—roads that carried not merely local, but inter-county or state traffic.

For months, behind closed doors, the engineers worked. They wanted the establishment of the routes to be free from every consideration of politics or local interests, and those seeking to intercede for various localities found only locked doors at the highway department.

Finally the routes were established, and so successful had been the arrangement that but ten votes could be mustered against the plan in both houses of the legislature.

Not all the 7,000 miles of the trunk system are to be paved—not by any means. The highway department of Minnesota is going at its job like a traffic director. Only those portions requiring hard roads, as shown by the traffic census, taken from time to time, will be paved. Others will be improved with macadam or gravel surfaced, depending on the volume of traffic. The engineers can tell by a glance at their surveys which roads are unable to bear the traffic to which they are subjected.

A traffic census in 1920, taken during the last two weeks in August, was much more extensive than previous observations. Observers were stationed on 179 main roads. They registered an average daily traffic of 76,799 vehicles on these roads. Of this number only 6,259 were horse drawn. The census revealed a tremendous increase in traffic. In two years, from 1918 to 1920, traffic on some thirty roads under observation increased approximately 50 per cent.

Startling increases were made on some roads. On the road from Wadena to Staples, the count was 182 in 1918, and this year, it was 509. The road from Willmar to Atwater jumped from 268 to 738, and the road from the Twin Cities to Elk River, from 554 to 1,268, as the daily average of vehicles. And the same percentages of gain obtained on many other roads.

Maintenance tests demonstrate, according to the highway engineers, that dirt roads, to be maintained economically, will carry not more than 150 vehicles a day, and gravel surfaced roads not more than 400. In many cases the danger point had been passed, the Minnesota census showed. One road, leading into St. Paul, carried a daily traffic of 1,645 vehicles, and numerous roads carried more than a thousand daily. Building and maintaining roads by the state is a new departure.

"Keeping up these arterial roads is just as much a state obligation as any state institution," said Mr. Babcock. "The main roads of a state are used not merely by the people who live in that county; they are used by people traveling from county to county and state to state.

"For instance, you may have a comparatively poor county, and a road leading through it to some city. A large commercial traffic develops on that road. It isn't fair for the county to be forced to maintain that road. The state ought to do it.

"Another thing—the census we have taken, showing the great volume of automobile traffic, shows that the principle is right. We are making the automobile pay for the good roads, but saving in cost of operation will repay the owners of the cars many times.

"In the past, the counties of Minnesota have spent 80 per cent of their road money in maintaining these main highways, bearing largely county-to-county, or state, traffic. They have neglected the more local, or connecting roads. In many cases, they have spent all their money on these main roads.

"The counties now will be free to use all their funds on the feeder roads. The past year, the county road and bridge fund, made up from all the counties, totaled $8,700,000. All of this can now be diverted to the local or feeder roads, instead of four-fifths of it being spent in the arterial roads. Then there is $1,700,000 in state aid to the counties from a one mill tax levied under a provision in the constitution.

"Then there is Federal aid to Minnesota of $2,800,000 a year, which will be allotted to the counties not for use on the trunk system, but on the local roads. This year, incidentally, the counties matched this by raising not equal amounts, but in many cases funds four times as great. So, Minnesota counties will have from $8,000,000 to $10,0000,000 more money for their local roads, hitherto almost neglected. By the end of ten years, we can have an improved road leading up to the door of every farm in Minnesota. These funds alone will build them.

"Such a plan as this is invaluable in a state like Minnesota. We have a great expanse of territory and very rich counties and some poor counties. Four counties have more than 50 per cent of the valuation of the state. We haven't kept up in the past with the growth of the state. Now we propose to improve the roads to meet traffic needs, putting them in good traveling condition throughout the state first, and then making more permanent improvements as we proceed.

"Our big trouble in the past is that we have been building roads something like the village used to put in sidewalks. Now we propose to connect up all the main highways of the state in one great trunk system.

"In other words we are going to build the trunk first; meanwhile the counties, building upon this trunk, can make their improvements effective. If they spend no more money than they now spend, in ten years we can have 28,000 miles of improved highways."

The Babcock amendment authorizes the legislature to issue bonds, but this will not be necessary. The license tax will provide sufficient money to build and maintain the 7,000-mile trunk system.

C. M BABCOCK

Commissioner of highways in Minnesota, who fathered the new highway program.

New Cars Add to Wear of Road

THAT the present interest in the construction of new highways should not divert attention from properly maintaining highways already improved is a point which the Bureau of Public Roads, United States Department of Agriculture, has had occasion to emphasize many times in recent months, particularly in view of the enormous increase in motor vehicle traffic which is taking place.

The bureau recently completed a compilation of statistics from all the states of the Union showing that there was a total of 7,565,446 registered motor cars (including motorcycles and trucks) in the United States in 1919. This is an increase of 23 per cent, or 1,418,829 motor cars over 1918. Such figures indicate that the country's highways are being used far more than in the past, it is pointed out, and in consequence added attention must be given to the repair problem. The increase in the number of cars for 1919 over 1918 represents about 10 per cent more cars than the total number registered in the entire United States for 1913.

Additional use of roads and streets has, of course, been accompanied by additional revenue paid to state and local governments in the form of license fees, which in nearly all states are devoted to highway needs. The registration and license fees for automobiles, trucks, and motorcycles in use in 1919 totaled $64,697,255.58—an increase of 20 per cent over 1918. The total revenues for New York and Pennsylvania the past year were about double the revenues received for all motor vehicle registrations and licenses in the entire United States in 1912.

Certain of the states, notably Maryland, have experienced difficulty in securing road-building materials owing to labor shortage, hampered transportation facilities, and so on. Maryland has had to make a special appeal to the Interstate Commerce Commission for aid in getting enough material shipped in properly to care for road repairs.

Minnesota Needs Good Roads, and Gets Them!

Top, left—Type of road banished by decree of voters of Minnesota; right, gravel surfaced road, popular and economical in Minnesota because of prevalence of gravel in state; immediate left, maintenance crew filling cracks in concrete on Minnesota state road; at the right and immediately below are shown two stretches of one road, unpaved, and paved.

It is a mean mud in Minnesota and such roads as that shown above are why voters decided to pull Minnesota out of the mud; at the right is shown a photograph of the new and the old in roads near St. Paul, a paved road and leading away from it a dirt road.

Jewish Copper Kings Reap Rich War-Profits

Copper Control Heads Up in Guggenheims and Lewisohns: Baruch, "Most Powerful Man in the War," a Noted Copper Financier

WITH this article we shall dismiss Mr. Bernard M. Baruch for the present. His activities are not by any means to be construed as the main effort of Judah in the United States, nor is he himself to be regarded as an important factor in the Jewish World Program. Indeed, it is to be doubted that he has been entrusted with many of the secrets of the Elders. But he has been found to be a useful man, willing to play the Jewish game with Jews, and consciously bound as all Jews are by an obligation to see that Jewish interests get the better of the balance wherever possible.

Mr. Baruch, of course, is much pleased with the rôle he was permitted to play in the government of the United States during the war; but he probably has sense enough to know that he was chosen for other than mere personal reasons.

Indeed, one of the keys to the controlling part which a few Jews were permitted to play in American affairs during the war is to be found just here in the question, Why was Mr. Baruch chosen? What had he been, what had he done, that he should have been chosen as head and front of governmental power in the war? His antecedents do not account for it. Neither his personal nor commercial attainments account for it. What does?

There was no elected member of the United States Government who was closer, or even as close, to the President during the war as was this Jew out of Wall Street. No one whom the people sent to represent them at Washington ever came within leagues of the privileges accorded to Mr. Baruch. Plainly this is an unusual situation, not explainable by the emergency at all, certainly not explainable by anything that is as yet a matter of public knowledge.

As one man out of many, all together serving the country, Mr. Baruch, of course, would be perfectly explainable. But as *the* man, *the* man whose single committee was run up through the fabric of the Council of National Defense until it formed the focus of the war government, he is not explainable.

Right in With "The Big Five"

IT WAS not only during the war, but also after the armistice, that these tokens of signal choice were showered upon Mr. Baruch. He went to the Peace Conference. Resigning as chairman of the War Industries Board on December 31, 1917—

"I went down to my place in South Carolina, and there received a wireless message from the President to come to Paris. I then went to Paris. I think I sailed about the first or second of January. I know one vessel broke down and I had to transfer from one to the other. But I had no further activities in connection with the government; that is, the War Industries Board.

Mr. Graham—"How long were you in Paris?"

Mr. Baruch—"I sailed, returning June 28 or 29. I came back on the George Washington." (This means that he was a part of the President's entourage.)

Mr. Graham—"What were you doing there, Mr. Baruch?"

Mr. Baruch—"I was economic advisor connected with the peace mission."

Mr. Graham—"You staid until the Peace Treaty was concluded?"

Mr. Baruch—"Yes, sir."

Mr. Graham—"Did you frequently advise with the President while there?"

Mr. Baruch—"Whenever he asked my advice I gave it. *I had something to do with the reparation clauses. I was the American Commissioner in charge of what they called the 'Economic Section.' I was a member of the Supreme Economic Council in charge of raw materials.*"

Mr. Graham—"Did you sit in the council with the gentlemen who were negotiating the treaty?"

Mr. Baruch—"*Yes, sir;* sometimes."

Mr. Graham—"*All except the meetings that were participated in by the Five?*" (Meaning the Big Five premiers.)

Mr. Baruch—"*And frequently those also.*"

This, then, is a sidelight on what has been called the "Kosher Conference," a name given to the Peace Conference by Frenchmen who were astounded to see thousands of Jews from all parts of the world appear in Paris as the chosen counsellors of the rulers of the nations. Jews were so conspicuous in the American mission as to excite comment everywhere. A Persian representative left on record this protest: *"When the United States delegation . . . . accepted a brief for the Jews* and imposed a Jewish semi-state on Rumania and Poland, *they were firm as the granite rock,* and no amount of opposition, no future deterrents, made any impression on their will. Accordingly, they had their own way. *But in the case of Persia they lost the fight,* although logic, humanity, justice, and the Ordinances solemnly accepted by the Great Powers were all on their side."

The comment is rather humiliating. But it is true. The Jewish World Program was the only program that passed through the Peace Conference without hindrance or revision.

Complaint Against U. S. Pro-Jews

SO NUMEROUS and ubiquitous were the International Jews at Paris, so firmly established in the inner councils, that the keen observer, Dr. E. J. Dillon, whose book, "The Inside Story of the Peace Conference" (*Harper's*), is the best that has appeared, was constrained to say this:

> "It may seem amazing to some readers, but it is none the less a fact, that a considerable number of *delegates believed that the real influences behind the Anglo-Saxon peoples were Semitic.*" (p. 496)

And again:

> "They confronted the President's proposal on the subject of religious inequality, and, in particular, the odd motive alleged for it, with the measures for the protection of minorities which he subsequently imposed on the lesser states, and which had for their keynote to satisfy the Jewish elements in Eastern Europe. And they concluded that *the sequence of expedients framed and enforced in this direction were inspired by the Jews, assembled in Paris for the purpose of realizing their carefully thought-out program, which they succeeded in having substantially executed.* However right or wrong these delegates may have been, it would be a dangerous mistake to ignore their views, seeing that they have since become one of the permanent elements of the situation. The formula into which this policy was thrown by the members of the Conference, whose countries it affected, and who regarded it as fatal to the peace of Eastern Europe, was this: *'Henceforth the world will be governed by the Anglo-Saxon peoples, who, in turn, are swayed by their Jewish elements.'*" (p. 497. The italics are ours.)

There are other matters pertaining to Mr. Baruch which must await the development of this study, but it is worth while just now to possess ourselves of the information at hand regarding his peculiar handling of the copper situation during the war.

Mr. Baruch is known as a copper man. Copper is Jewish. That metal, throughout the world, is under Jewish domination. The Guggenheims and the Lewisohns, two Jewish families, are the copper kings of the planet—not that they confine themselves to copper; for example, their output of silver throughout the world is one-fourth more than is produced in the entire United States.

By his own testimony, Mr. Baruch was interested in copper concerns. What his holdings were during the war he did not disclose. But what his actions were has been very clearly set forth bit by bit in various inquiries.

Before the United States entered the war, Mr. Baruch rounded up the copper kings.

"I went to New York and saw there Mr. John D. Ryan and Mr. Daniel Guggenheim," he said in his testimony. This was in February or March, 1917, he wasn't sure which, but he said it was "before we went into the war."

What's Competition Between Friends?

NOW, who were these gentlemen? Mr. Ryan was apparently in charge of the reorganized Lewisohn properties, while Mr. Guggenheim was chief of the seven Guggenheims who form "a business family and a family business." They divided business during the war. The United Metals Selling Company, which sold the United States Government its copper during the war, was the Lewisohn business reorganized, of which Tobias Wolfson was vice president; and the American Smelting and Refining Company was, apparently, the Guggenheim interests.

There was no competition between these two during the war!

How did it come about that these two worked together? Their case is clear on paper: their answer is that Mr. Baruch asked them to! And Mr. Baruch is clear, too; was he not a government official? And did they not show patriotism in doing as the government official bade them?

It came to this: the "Government" made a rule that it would do business only through the American Metals Selling Company as the representative of the copper producers of the United States. This meant, of course, that if the few competitors of this Jewish copper combine were to do business with the government, they too had to make arrangements with the American Metals Selling Company.

Mr. Graham—"But how did it happen that you were representing the other companies who were your competitors?"

Mr. Wolfson—"Well, at the request of the War Industries Board, we offered a copper producers' committee."

Mr. Graham—"Who requested that?"

Mr. Wolfson—"Mr. Eugene Meyer, Jr., representing Mr. B. M. Baruch."

Mr. Graham—"Now let us find out who Mr. Eugene Meyer, Jr., was. Do you know him?"

It develops that Mr. Eugene Meyer, Jr., is another Wall Street man who "had large investments in copper," though whether he retained them during the war, Mr. Wolfson did not know.

Mr. Graham—"Then Eugene Meyer, Jr., went into the War Industries Board and took up with the copper producers the question of furnishing copper, did he?"

Mr. Wolfson—"Yes, sir."

As the result of that request a meeting was held at 120 Broadway, at which were present, among a few others, S. S. Rosenstamm, L. Vogelstein, Julius Loeb, T. Wolfson, G. W. Drucker and Eugene Meyer, Jr.

Mr. Graham—"Any army officers there?"

Mr. Wolfson—"No."

The witness here quoted, Tobias Wolfson, was one of the most active instruments in the actual passage of business, but the Washington representative was a Mr. Mosehauer. The interesting thing about Mr. Mosehauer is that he represented both the American Metals Selling Company and the American Smelting and Refining Company—the Lewisohns and the Guggenheims—and by order of Baruch, with the approval of the government, the business was done with these two corporations.

Patriotic Credit Without Cost

HOW did they divide? It was very simple. Mr. Wolfson euphoniously describes it as a division of labor: the Lewisohn group took the trade with the United States; the Guggenheim group took over the foreign business with the Allies.

Now, the next interesting point is the special committee through which Baruch's board dealt with the copper producers. This committee, representing the government, consisted of three persons: Pope Yeatman, chief; E. C. Thurston, assistant; Andrew Walz, assistant.

Pope Yeatman was a mining engineer employed by the Guggenheims at $100,000 a year.

E. C. Thurston was Pope Yeatman's assistant in that private employment.

Andrew Walz was consulting mining engineer for the Guggenheims.

Everything was all set. The Jewish metal monopoly was assured of control on both sides of the Atlantic.

It was perhaps thought desirable, in view of the bad political odor which had accompanied the copper power in several states, mostly in connection with the "copper Senators," like Clarke, of Nevada (readers of this series will remember, in connection with the name of Guggenheim, that it was Senator Simon Guggenheim who fought against the census enumeration of Jews as once proposed by the census officials), that something be done to gild the arrangement.

It was apparently necessary to do something to disarm the protest that might arise against this thorough Judaizing of the war metals, therefore a very fine show of patriotism was made. This is worthy of notice in view of the "show institutions" mentioned in the Protocols. The American public is becoming accustomed to these "show institutions"—proposals which promise everything and then fade away into nothingness. It is one of the most effective methods of destroying the morale of a people.

When Mr. Baruch saw the head of the two copper families, he says he found them willing to think of nothing but giving copper to the government—money was of no consideration whatever.

Mr. Baruch—"They said that so far as the United States Government itself was concerned they would give Uncle Sam all the copper he

wanted for his preparedness campaign . . . . at any price that was decided upon. In order to arrive at some price we took *the average price for 10 years which was about 16 2-3 cents;* and that is how the price happened to be arrived at. At the time that they said this, *copper was selling somewhere around 32 and 35 cents a pound.*"

There, then, was a magnanimous thing! The government was to be given copper at half the market price. But did the government get it at this price? Wait—the story is a good one.

This unheard of sacrifice of profits for patriotism was extensively advertised. The secretary of the Council of National Defense wrote a stirring story for one of the best magazines, in which he said:

"Mr. Baruch first announced his presence in the tremendous task of mobilizing American industry by procuring 45,000,000 pounds of copper for the army and navy at about half the current market price, saving the government in the neighborhood of $10,000,000."

Mr. Baruch himself, in his testimony, expanded with the generosity of it all. In an apparent mood of "help yourself to all you want" he said:

"On inquiry we found that . . . . the army and navy . . . . wanted only 45,000,000 pounds, which used to be a lot of copper before we got to dealing in astronomical figures; and they were given all the opportunity to consider what they wanted. They could just as well have had 450,000,000 pounds as 45,000,000 pounds, because there was an open offer."

Getting It Back Again at a Profit

NOW for the effect which this produced on the country at large:

"The effect of that offer of the copper producers was electrical," said Mr. Baruch. *"It showed that there was in this country a desire to set aside selfishness,* so far as our government was concerned in its need . . . . 'Make us any price you want.' So that was practically the attitude that the producers took."

But the government did not get copper at that much-advertised patriotic price.

Mr. Graham—"They did not pay 16 2-3 cents for the 45,000,000 pounds?"

Mr. Baruch—"Oh, no; not these other large quantities of materials."

He said that the copper was furnished to the government without receiving money for it; price-fixing was yet in the future. "Then we came to the point, 'Well, what about the civilian population?' So we made a rule that became a policy, that whatever price was fixed it should be for everybody; that what was fair for the army and navy was fair for the civilian population."

There seems to have been a rapid cooling of generosity under the prospect of colossal sales. And the upshot of it was that, after all the hurrah, *the government really paid about 27 cents.*

What these figures mean, can be deduced from the fact that during the war the government bought 592,258,674 pounds of copper.

If the reader is not already staggered by the import of these facts, there remains one more for him to consider—

After the armistice the surplus copper was sold back to the copper producers. In April and May, 1919, the American Metals Selling Company received from the United States Government over 16,500,000 pounds of copper at *a fraction over 15 cents.* This was less than the boasted patriotic price of 16 2-3 cents at the beginning. Not counting what they had received from the government for the copper in the first place, their profits on the difference between the price they paid for the surplus copper and the price for which they sold it again, were beyond counting.

This is what occurred under the triple copper monarchy of the Baruchs, the Lewisohns and the Guggenheims, and their Jewish assistants and Gentile fronts. However, "Gentile fronts" were boldly dispensed with to a very large degree during the war. The real powers behind the throne themselves stood out, and did not hesitate to set their own people at every crossroads along the line of war business.

It is not to be supposed that the Baruch influence began or ceased with copper, nor with any of the multitudinous industrial powers which he possessed. A man like Baruch makes the most of such opportunities as were then his. In matters political, personal and even military, there were many openings for the use of his influence, and well-informed people about Washington did not doubt his facility in these things.

Once, however, Mr. Baruch felt he was skating on thin ice with regard to the law. He had gone ahead on his own plan, but in such a way that he would exercise the power without taking the responsibility. That seems to have been a very clear ideal with him—power without responsibility. Everything was fixed, all the conditions within which every contract would have to be made were carefully determined, but Mr. Baruch never permitted himself or his board to make a contract. After having consulted with numbers of his associates in business, an agreement was reached, and only then were the responsible officers of the government told, "Go ahead and make contracts." The officials took the responsibility, but the Baruch coterié made the conditions and then remained aloof.

Even this plan, however, had a questionable aspect which came to trouble Mr. Baruch, and the manner in which he manipulated the matter shows either a very shrewd mind or else very shrewd advice. The latter undoubtedly went with the former: there were plenty of Jewish advisors about.

To begin with, Mr. Baruch says: "The members of that committee *were picked out by myself; the industries did not pick them out.*" Which means, in fact, that Mr. Baruch picked out a group from a group that had previously been chosen by the producers, although plainly Mr. Baruch was desirous of modifying this impression. And again: "It is true that these great copper producers were on the committee, and I selected them because they were great men . . . ."

Now, these men, as members of a government committee, were to all appearances selling to themselves as members of the government committee, and, apparently, buying from themselves as owners and controllers of the great producing combinations. Not necessarily in any discreditable way, but in a very unusual way.

Where the Legal Ice Was Thin

IN THE face of this condition, Mr. Baruch had the coolness to say, "So you can see that the government was as much in the saddle as it was possible to be." The producer-members of the committee, headed by Baruch, were the government, so far as this statement is concerned. Time and again it was shown that the responsible officials of the government were not even visible until this extra-government had determined all the conditions.

Mr. Garrett—"Did any troubles arise with the committees growing out of the legal situation, that you remember of?"

Mr. Baruch—"The committees of the trade, especially some of those that I had asked to serve, were very much disturbed about their standing in reference to the Sherman Anti-Trust Law. Is that what you refer to?"

Mr. Garrett—"Yes."

Mr. Baruch—"And also in regard to the Lever Act, on the point that 'no man could serve two masters.' . . . . There was no basis for it . . . . because these men were not serving two masters. They did not make trades with themselves, but, with the instrumentality provided, carried out the government's wishes or orders or suggestions with reference to the particular industry which they represented."

The "instrumentality" with which the copper men dealt, for example, was the American Metals Selling Company which, together with the American Smelting and Refining Company, was represented at Washington by Mr. Mosehauer. The special copper committee, composed of Guggenheim employes, did business pertaining to the "instrumentality" which carried on the business of the combined copper companies.

It was dangerous. Some of the members seem to have felt it before Mr. Baruch did. Mr. Baruch never seems to have questioned anything that he did. Why should he? He "had more power than any other man in the war" and he had the most powerful and autocratic backing that a man ever had. But the others, the non-Jewish members, were thinking of the law.

So Mr. Baruch solved it very nicely. He took the committees, comprising the same men, and had them named as committees of the United States Chamber of Commerce for their various industries, and although the process was not changed in the least, the legal aspect of it was changed. It was rather clever. It was more, it was typical.

Agents of U. S. or Corporations—Which?

AND after that, Mr. Baruch who had previously insisted that he himself had picked those men and that the industries had not, thus clearly encouraging the inference that these men did not represent the industries' side, but the government side of the matter, he now insists that they represented the industry.

Mr. Graham—". . . . you changed and took these advisory committees and had the National Chamber of Commerce reappoint them, so that they then were direct representatives of the Chamber of Commerce and not of the officials of the United States or connected with any governmental machinery?"

Mr. Baruch—"I never considered them officials of the government, Mr. Graham."

Mr. Graham—"They were as much officials of the government as the rest of you, were they not?"

Mr. Baruch—"I do not think so . . . . (after several questions) . . . . I asked them to serve so that when the government wanted anything they could go to one small, compact body, rather than to send out to I do not know how many people. You see?"

Mr. Graham—"Let us see about that. They were serving under you, were they not? You were the head?"

Mr. Baruch—"I appointed them and asked them to do this so that I could have a compact body to deal with."

Mr. Graham—"You did not think for a minute that they were representing the government, but did you not think *you* were?"

Mr. Baruch—"I was doing the best I knew how."

Mr. Graham—"But you had authority to bring these men in, Mr. Baruch, and appoint them as committeemen under you, and you did so. Surely, if they were representing anybody it was the government, was it not?"

Mr. Baruch—"I do not think so."

Mr. Graham—"Am I right in assuming that you thought they represented the industries?"

Mr. Baruch—"Yes."

A great deal, of course, can be overlooked in men who were working under stress and endeavoring to do things the best way. It does not follow that because a business man serves the government in matters pertaining to his own business, he is necessarily dishonest. But so frequent is dishonesty under such conditions, or, if not dishonesty, then a loss to the government because of a divided interest, that laws have been framed to regulate such matters. These laws were on the books at the time.

This is a fact, whatever else may be true, that "copper" made tens and hundreds of millions out of the war and it is not at all inconceivable that if "copper" had not been so completely in control of the government operations of purchase, the profits might not have been so great, and the burdens which the people bore through taxation, high prices and Liberty bonds might not have been so heavy.

Mr. Baruch is but one illustration of the clustering of Jewry about the war machinery of the United States. If the Jews were the only people left in the United States who were able enough to be put in the important places of power, well and good; but if they were not, why were they there in such uniform and systematized control? It is a definite situation that is discussed. The thing is there and is unchangeably a matter of history. How can it be explained?

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

"More influence has been exerted to suppress the document known as the Protocols or The Protocols of the Wise Men of Zion than has before been employed in a similar undertaking," says the Beckwith Company, publishers, 162 East Twenty-third street, New York, in announcing an edition of the Protocols. "Nevertheless, it is being published, and will be supplied as the demand increases. It has been found impossible to advertise its sale, and the publishers must therefore depend upon other means to reach the American public." The book is very well made and contains a valuable epilogue in which the Protocols are discussed in a dispassionate, scholarly manner. Five illustrations of various editions of this famous document are inserted. The Beckwith translation is the most satisfactory one that has thus far appeared.

The head of the Mandate Commission of the League of Nations is M. Brantung, the Swedish official well-known for his pro-Zionism.

Every synagogue in Geneva held special services to mark the opening of the League of Nations in that city. Large numbers of leading Jews from all parts of the world are found on the outskirts of the meetings.

Special recruiting offices for the "Jewish Legion" have been opened at Jerusalem, Jaffa and Tiberias.

Again in Vilna, where the Jews are reported to have undergone the most vicious "persecutions," the Kehillah is campaigning for the appointment of a Jew as assistant chief of police. This is only one of many instances where the news contradicts the propaganda.

It is said that President Wilson may appoint Henry Morgenthau to represent him in a sort of overseership of affairs in Armenia. Such an appointment would be unfortunate because of the fact that the so-called "Turkish" persecutors of Armenians are not Turks but Jews who have embraced Mohammedanism and ascended to high places in Turkish affairs. If there were in the world any adequate intention of giving the people real and enlightening information, this knowledge would not be new. Turkish resentment against the Christian Armenians cannot be explained except by reference to the numbers and power of the pseudo-Turkish Jews, such as Renzi Bey, Djavid Bey, and others.

The Chicago *Jewish Sentinel,* of November 26, in an article attacking the Catholic church, has this statement: "Whenever there is a revolution against Rome, the Jews are the beneficiaries, because our only great historical enemy, our most dangerous enemy, is Rome in all its shapes and forms and in all its ramifications."

Saw First Gold in California

RODNEY C. ADAMS, aged eighty-nine years, is the last person alive who saw the first gold mined in California. He was born in Madison County, Illinois, in 1831, and when a child emigrated to Western Missouri with his parents. In 1847 he went with his parents in the Mormon ox train to what is now Salt Lake City. On the route across the plains his parents dissented from the Mormons in their polygamy doctrines. At the first chance young Adams and his parents pushed on across the Sierras.

Now Rodney Adams, an aged man living with his granddaughter in Riverside County, is the last alive, as far as Californians can find out, who was close to James Marshall when the first golden nuggets were found. He is writing his recollections of California before the miners came, and a publisher is awaiting copy as it is slowly ground out. His recollections have been invaluable for Pacific Coast historians.

RODNEY C. ADAMS

"I recall that morning in January, 1848, when James Marshall found the first gold," said Mr. Adams as he sat in his granddaughter's house at Hemet, California, the other day. "I was vacquero for Captain John Sutter, although I was but a youth. I was away with cattle the morning Marshall found the gold.

"I got back to the ranch house late in the afternoon, and Jim Marshall, who had been building a mill race for Sutter's grist mill, was sitting on the house front steps. I recall that Marshall was more cheerful than usual.

"He motioned me to come to him, as I dropped from my mustang, and said in low tones:

"'Rod, what'd you say if I could show this whole country full of gold?'

"What could I say, a green boy off the plains? What did I know of a gold-crazy world? I kept my mouth shut, and looked wise. Marshall then took me to one side, and told me in half-whispers how he had found five chunks of native gold as large as filberts. He showed me the nuggets, upon which he had experimented by boiling, hammering and scraping to find whether they really were gold. Marshall had no idea then that his discovery was so important. His mind was set on the mill which he had almost finished and on several mechanical devices he had invented in it. Among the things he said to me about the gold he had found was that some day he was going to hunt systematically for more gold nuggets and that he might get a few thousand dollars of a fortune together in that way. He had absolutely no idea of the vastness of the mining possibilities his discovery would lead to.

"So little did the finding of the gold disturb either of us that I remember that we went to bed early and slept soundly. Marshall cautioned me to keep the gold find a secret. But Marshall was loquacious and he himself bragged of his find. Five days later several Mexicans brought in more nuggets. Then the Mormons, who were working for Sutter and Marshall, found gold and the importance of the find increased a little in the minds of Marshall and all of us at the Coloma camp. A few years later, when the world's commerce was turned, as Lord Derby said, by the gold discovery in California, and when more than 300,000 young men had flocked to California, and had made a new civilization, I wondered how we could have been so blind at first to the meaning of the first nuggets that Marshall picked up.

"The news did not get down to San Francisco, about 150 miles away, until three months later. When the gold was shown him, Captain Sutter said, 'Yes, that's gold, and it will be the curse of us;' meaning that it was the end of their schemes for a big sawmill and flour mill along the American River.

"But another week passed before the belief became general at San Francisco that back in the mountains gold had actually been found. I remember that educated men argued that the geological formation of the Sierras made the finding of gold there an absurdity. Some said the golden flakes exhibited were iron pyrites, and others laughed and said they were from a copper formation. The San Francisco *Star* pitied people who could believe there was gold enough in all California to buy even a respectable meal.

"Later—on May 12, I believe—a Scotch ranchman rode into San Francisco directly from the diggings. He was an intelligent and reputable man. He brought with him about 200 pounds of gold dust and nuggets to trade for merchandise. Then there was excitement and bustle. All that day and night the saloons were thronged with men who talked of nothing but the chances there might be for them in mining. One man, a Mormon, was so wild with excitement at the thought of digging gold that he went up and down the bay shore yelling, 'Gold, gold, gold.' Several saloon men who could not sell their stock locked up their places, determined to let them go to the dogs while they were washing gold.

"The earliest stampede of excited men to the gold diggings of California therefore began May 12, 1848. I remember that day in San Francisco. The whole population of the town did not sleep and scarcely took time to eat until the first crowd had embarked on all manner of craft up the river to what is now Stockton, thence across the country to the north fork of the American River. By the first of June the news of the discovery had gone as far down the coast as Monterey. The gold diggers at Coloma were by this time sending out so much gold to buy provisions, tools and clothing that convincing evidence of the richness of the sand bars and creek banks followed closely upon the heels of the news. All in Central California who could get away went chasing over the country toward the American Fork. Less than one-twelfth of the male population of San Francisco remained when June had come. Whole families packed up and went to Coloma. On two streets of homes and stores none but women and children remained. Half the stores and every public inn were closed because both boarders and hosts had gone to the American Fork. The village of Santa Cruz packed up and started for the mines in twenty-four hours. The news of the gold find and samples of the gold reached Monterey late in May, and in two days every man in the village but five started for the American Fork. The village of San Miguel, with some 500 population, was absolutely deserted by every human being during the first week in June and I don't believe there were even three men in a hundred who remained at home in California in the spring and summer of 1848. I remember hearing a fellow miner tell how he had found the jail at Monterey empty, the prisoners, sheriff and all the peace officers at the mines, and of seeing General Mason, of the United States Army, and a commodore of the United States Navy, cooking their own food in a deserted hotel at Monterey, because all their servants and men had deserted in the night and had followed the rush toward the American Fork. By July there must have been about 5,000 miners at work with shovels and pans along the American Fork, and there were arrivals from more remote localities in California every day. Between 7,000 and 8,000 Californians in that first season of gold mining, from May to January, got fully $10,000,000 worth of gold.

"The first year of gold mining in California—that is from May, 1848 to May, 1849—was far different in its easy, quiet way from that created by the excited gold-hungry Easterners, who with the opening of the spring and summer of 1849 came swarming across the plains, over the isthmus and around the horn. There was little or no gambling. The miners left their pounds of gold under their beds and went unconcernedly miles from camp. There were no mining laws to be considered. It was a perfect mining Elysium.

"As I look back at those days now it seems we were like big children going about in a vast natural treasure house, wondering how much riches we might carry away when we were ready, but meanwhile frittering away our time and opportunities. When I remember the whole acres of gravel and sand, richer than anything ever found on the Klondike, that we abandoned because we heard of a better El Dorado on another remote creek or river, it seems as if that era must have been a dream.

"The restlessness and greed to get the very cream of the diggings kept the greater part of us poor in spite of the fabulous opportunities.

"The unhappiest and most pitiful man of all the tens of thousands of men who washed gold up and down on almost every creek in Central California was Marshall—the discoverer of the gold. He became a drinking, profane man when he saw how his and Captain Sutter's property was ruined by the excited gold seekers, who entered upon it without even asking the right. He threatened legal prosecution. His threats were but hooted and jeered. He promised vast sums for lawyers who would eject the thousands of gold miners from his and Sutter's land, but no one heeded his words. He went about from camp to camp fuming and threatening the men that he would soon dispossess them of their gold by legal process. He claimed the legal right to all the gold in that locality, and he swore that he would never mine an ounce till the United States laws drove out the trespassers and restored the property to Sutter and him. No one but the Mormons paid any attention to Marshall. The Mormons recognized Marshall's rights and they used to deal out to him and Sutter part of their nuggets and dust at stated periods.

"The Mormons, who were about the first men in the new diggings, located on the north fork of the American River. I have seen them wash out gravel at the rate of $3.50 a pan for hours at a time. They were secretive fellows, but I had it on good authority that they cleared more than $150,000 in several months in 1848. The best I ever did in any one day was in the summer of 1892. Partner and I were operating a rocker on the Tuolumne and were working in a streak of gravel about two feet below surface. We got an average of eleven ounces of gold every day for two weeks. Unfortunately our claim petered out quickly after that. The man whose claim adjoined mine had better luck. He had an area of 500 square feet to work and between September, 1848, and May, 1849, he got out 130 pounds of gold.

"I knew James Marshall intimately until he died alone and in poverty in his lonely cabin at Coloma one day in August, 1885. He became a hard drinker as he grew old. His treatment by the horde of miners embittered him against the world. He was so bothered by the tourists and reporters, who wanted to hear him tell his story, that he went back into the mountains to live by himself. California gave him a pension of $1,200 a year for a few years, but that was cut off because the legislature believed the money was spent in drink. Leland Stanford once agreed to give the old man the use of a pretty cottage in Oakland, but Marshall said he would not accept charity."

A Fish That Builds a Nest

IN THE shallow fresh water streams that empty into the oceans, the sea lampreys build their nests each spring, and for the person who is lucky enough to discover these eel-like fish at work building their nest there is a really interesting sight in store.

The lampreys are not fishes, for they have no paired fins, and the formation of their mouths is different from that of a fish. In appearance they closely resemble the eel, and, as an eel, might not be given a second thought. Lampreys are found both in Europe and America, and the sea lamprey is the largest member of the family, sometimes reaching a length of three feet. Their mouths are cap-shaped, and have great suction power.

A shallow stream with a pebbly bottom is chosen for the nest, two or three lampreys working together.

After the site of the nest has been found, the lampreys use their mouths to suck up and lift the pebbles from the stream bed, carrying them outside the space needed for the eggs. If a stone should be encountered that is too large to be lifted, the lamprey charges against it, head on, butting the stone over and over till it is rolled away. Lampreys have been known to move stones as big as a half brick.

When the nest is finished it is about three feet wide, and from four to six inches deep. The eggs, resembling pear-shaped grains of sand, and invisible to the untrained eye, are scattered over the nest. They hatch in about two weeks, after the nest has been deserted by the elders and the removed pebbles washed into place again by the action of the water.

The young lamprey looks so greatly different from the mature fish that it was once thought to be a different fish. The young live in the shallow stream of their birth for three or four years before obtaining full growth, and then swim out to the sea, where, at the end of another three or four years—the exact amount of time has never been certain—they reach maturity, and return to some fresh water stream to make their nest. At sea they obtain food by fastening themselves to some fish and scraping the flesh with their sharp teeth. It is possible for a lamprey to hold on to the bottom of a vessel and travel miles.

The work of the building of the nest is frequently the last labor of the lamprey. They are nearly always injured in moving the stones that lie in the spot they wish to use for a nest, and into these wounds microbes find their way and cause disease which results in death. They swim to the bank not far from their nest, and find a final resting-place, seemingly sacrificing their lives for their young.

Lampreys are good to eat, and in some localities are considered a delicacy, but their flesh is very rich and indigestible.

How Animals Sleep

ELEPHANTS sleep standing up. When in a herd, a certain number will always stand watch while the others sleep, for the big, powerful beasts are timid and cautious at night and will not go to sleep unguarded.

Bats sleep head downward, hanging by their hind claws.

Birds, with few exceptions, sleep with their heads turned tailward over the back and the beak thrust beneath the wing.

Storks, gulls and other long-legged birds sleep standing on one leg.

Ducks sleep on open water. To avoid drifting ashore, they keep paddling with one foot, thus making them move in a circle.

Foxes and wolves sleep curled up, their noses and the soles of their feet close together and blanketed by their bushy tails.

Lions, tigers and cat animals stretch themselves out flat upon the side. Their muscles twitch and throb, indicating that they are light and restless sleepers.

Owls, in addition to their eyelids, have screens that they draw sideways across their eyes to shut out the light, for they sleep in the daytime.

The Origin of "Tenderfoot"

NO TERM used in the Far West is more significant than "tenderfoot," and in no connection is it more used than in relation to horsemanship.

If a person approaches a horse to catch him or saddle him from the "off" side, or mounts or dismounts on that side, he is more sure to be styled a "tenderfoot," than when he cannot shoot straight. The tough western mustang or broncho used in the mountains and on the ranches in the Southwest was formerly never shod. His hoofs grew so tough that shoes were not only unnecessary, but a hindrance, for tough unshod hoofs are much more sure-footed on rocky trails than are iron shoes. After once being shod, however, the hoof always needs it, and becomes very tender and lame without an iron shoe. As nothing is more useless to a western ranchman or guide than a lame horse, and as shoeing was not easy in the early days, a "tenderfoot" horse was despised. The unshod "toughfoot" was always reliable. Hence we have the western term to donate a "greenhorn."

Caring for the Affairs of Jugo-Slavia

By AARON HARDY ULM

WHAT has become of Serbia? Why, now that peace prevails, do we hear so little of the people whose misfortunes precipitated the World War in August, 1914? Those questions are probably idle, mayhap foolish, ones to persons who keep up with the details of international affairs. But no doubt there are many who have only a vague notion as to what has happened to the small Balkan state that big Austria wanted to destroy, Russia wanted to save, thus giving Germany the pretext for marching on Belgium to attack France, Russia's ally, bringing Great Britain and finally most of the world into the fray.

When steps were taken to get into touch with Serbia's diplomatic spokesmen in Washington, it was discovered that there is no longer a mere Serbian legation at the national capital but, instead, a legation of the Serbs, Croats and Slovenes. In common phraseology Serbia has all but disappeared and in its place has come Jugo-Slavia, Yugo-Slavia or Yougo-Slavia, depending on which term seems best to you. All are used with authority but the second conforms best to correct pronunciation, though the first is used most in this country. In none of its forms is the term official. Instead the strictly proper name of the country that was Serbia, being now much more than what was little Serbia, is the kingdom of the Serbs, Croats and Slovenes. Prior to the peace that ended the Great War it was merely the kingdom of the Serbs, who have always insisted on designating themselves as a people rather than as a country.

(C) Harris & Ewing

DR. SLAVKO Y. GROUITCH

Minister from the Kingdom of Serbs, Croats and Slovenes to the United States.

The obscure legation that used to get along in Washington with one or two secretaries and clerks now is one of the largest in the national capital. The country of 2,500,000 population it used to represent has grown to be one of more than 10,000,000 people. It is a very busy legation, too, for old Serbia had virtually no consulates in this country and the new government has been able as yet to establish only a few. Under the old régime about all they had in the way of a consular service was an honorary consul-general in New York. The designee was a professor in Columbia University.

Little Serbia as of old had very little dealings, commercial or otherwise, with the United States. Comparatively few of the immigrants to this country came from there. It is estimated that there are not more than 40,000 persons of stock belonging to what was Serbia before the war in this country. However, there are or lately were nearly a million persons in America belonging racially to Serbian or closely kindred stock. They came from territory adjoining Serbia that belonged to the old Austrian-Hungarian empire, territory that now in the main is included within the country that was Serbia. Chiefly they are Slovenes and Croats, with many actual Serbs who came from Herzegovina and Bosnia, the two Austrian provinces that lay at the basis of Austria's attack on Serbia. It was a Serbian who in Sarajevo, the capital of Herzegovina, shot the Austrian crown prince and thus supplied the pretext for the demands Austria made of Serbia and in the making started the Great War.

Both Herzegovina and Bosnia are now parts of Serbia. While most of their population is Serbian, the two provinces give much contrast and some complication to the new kingdom of the Serbs, Croats and Slovenes. Though they are on the Adriatic and about a thousand miles from Constantinople, only about a half century has passed since they were wrested from the rulership of Turkey which held them in subjection for many centuries. In fact, only about fifteen years' time has passed since nominal Turkish rule was supplanted by full annexation to Austria. Some Moslems still help make up the population of the two provinces. A large proportion of the native Slavs are Mohammedans as the result of former Turkish domination.

The population of the enlarged kingdom is on the whole homogeneous, its representatives in America say. Ninety per cent or more are Slavs and Slavs of like history, traditions, language and in the main customs. Hence they are called Jugo- or Yugo-Slavs, which means Southern Slavs. Therefore, the term Serbian has been absorbed very largely by the more embracing one, Jugo-Slavian.

It is stated that the language of all the Southern Slavs is the same, differing only to the extent of varying spoken dialects. In the old Austrian-Hungarian provinces the Latin alphabet is used; in Serbia they cling to the Cyrilian or Russian alphabet. The latter has 32 letters devised specially for the peculiarities of the Slav languages The Latin has only 26 letters. The difference in alphabets brings unique rather than serious complication, for most of the people are familiar with both. But there are other differences which complicate the affairs of what was perhaps under the old order the most homogeneous country in the world. The distinction of old Serbia was that it was a "peasant kingdom." There was no nobility, recognized or understood. There were virtually no classes —only one, the peasants. Even the royal family is of peasant stock, the grandfather of the present king having been a herder of goats.

Agriculture was almost the sole industry and it was carried on by very primitive methods. The rich soil, however, rendered the people so comfortable that Serbia used to be called "the poor man's paradise."

The added provinces are different. Long foreign rule developed big landed estates, a strong middle class, a nobility and a complicated life in general. The Slovenes and the Croats are betted educated than the Serbs and know more about the world and affairs in general. They are inclined somewhat to look down on the Serbs as crude and ignorant peasants who are beneath them.

There is an inevitable struggle on over which of the different peoples shall dominate the new kingdom. The Serbs with an independent government long established and with high repute among the nations naturally expect to be the center around which the new kingdom will revolve. They favor a centralized government, in which all the different provinces will have due share in its operation. The Slovenes and the Croats rather favor a federated government, with each province running its main affairs to suit itself. The question is soon to be decided in an election of a constituent assembly which is to draw up a new constitution for the kingdom.

The enlarged kingdom has its full share of internal politics but its representatives say none of the problems forebode serious trouble. There is a large Socialist party, especially in the old Austrian-Hungarian provinces, but there is no serious opposition to the monarchy, which because of King Peter's heroic part in the war, as well as the prince regent's personal standing, is very popular.

"We have nothing to fear from the monarchy," said a leading Serbian. "It is without actual authority and there is no nobility or privileged classes to support it were it to become autocratic. In essence Serbia has long had a democratic government, ruled by a popular parliament patterned much after the English system. Even the humblest peasant doesn't hesitate to approach and talk freely with the king and even to tell him how the state should be run."

There is some Bolshevist sentiment, as in all Europe, among the peoples of the new Serbian kingdom. It is not of threatening importance, say legation attachés, despite the fact that the municipal elections in Belgrade, the capital, were carried recently by a group whose principles are tantamount to Bolshevism. They were not allowed to take control, however, as the conservatives claim the victory was won by a fluke.

They have their external troubles like all the other new countries, of which it substantially is one. The Magyars of Hungary take a belligerent attitude toward all its neighboring Balkan states, except Austria, which is helpless. Because of them and the Italians, the Jugo-Slavs, Czecho-Slovaks and the Rumanians have formed a self-protective alliance. Differences between the Jugo-Slavs and Italy over Dalmatia and Fiume seem to have been settled, without the concurrence, apparently, of D'Annunzio, the spectacular "fly in the ointment" who holds on at Fiume and insists that it shall be Italian territory instead of a free city as decreed by the Peace Conference.

"The D'Annunzio problem will take care of itself," said a Serb who spoke authoritatively. "Of course, if it comes to the point that he must be put out and the Jugo-Slavs are told to do the job we will have him out of Fiume in twenty-four hours."

D'Annunzio and other external problems have continued the war, in a preparatory sense, for the Serbians, a war that has been on continually since 1912. The Balkan-Turkish war, followed by that with Bulgaria over the spoils, had been scarcely closed when the Great War caused Serbia to be swept away as perhaps no other country was ever before swept away by an invading force. They still feel impelled to maintain a standing army of a quarter of a million men.

But despite the long period of severe travail, actual conditions are not nearly so bad as you might imagine.

"Six months after the armistice, Jugo-Slavia had fifty million tons of grain for export," says Captain Gordon-Gordon Smith, an authority on that land and a member of its Washington diplomatic establishment. "This in face of the fact that a year before the armistice virtually the entire Serbian population had been forced into the mountains of Albania. Their farm implements, such as they had, had been destroyed, cattle and other domestic animals slain, thousands of houses burned, the railroads rendered useless—the country crushed as few countries have ever been crushed."

Serbia's comeback in the matter of food production was due largely to the primitive methods employed in tilling the soil. The farmers knew how to get along without the kind of plows that come from factories and even without oxen, the country's chief source of hauling power, to pull them. Most of the farms had been operated for ages on the community, co-operative basis, and the owners were able by joint effort to overcome many of the disadvantages that faced them on return to their homes.

The legation states that Jugo-Slavia will have 250,000,000 tons of surplus grain for export this year. It is difficult to move it, even to Austria where it is vitally needed to stave off actual starvation, because of the condition of the roadways and the railways.

The railways are being put into operating condition, trains are now moving regularly along the main lines.

"Belgrade will be the great railroad center of Eastern Europe," said a member of the Washington legation staff. "From it will radiate great continental trunk lines connecting all Europe; Paris with Saloniki, Constantinople and even Odessa, and St. Petersburg and Berlin with the Eastern Mediterranean. It will be the main connecting link some day in a rail line from London to India.

"Jugo-Slavia needs American farm tractors and automobile trucks and automobiles and farm implements and railway equipment. For those things we present an almost unlimited market. It is stagnant now because of the currency situation."

(C) Harris & Ewing

MADAME GROUITCH

Formerly Miss Mabel Gordon Dunlap, of Clarksburg, West Virginia.

When the Germans were forced out of Serbia and the Austrians and Hungarians let go the other provinces now attached to that kingdom, a flood of paper money was left behind. It couldn't be outlawed. It has been taken up and supplanted by other paper money, which, like the currency of all the new and reinstated countries of Europe, has an exchange value far below par. Where the chief currency unit of Serbia used to be worth twenty cents in American gold it is now worth only three cents. Being an agricultural country, Jugo-Slavia has little in the way of exports we need to exchange for American goods; hence very little commerce is going on between the two countries.

"While we need much in the way of American manufactures we need most of all American brains and industrial enterprise. In natural resources Jugo-Slavia is the richest country for its size in the world. We have iron and coal and all the important minerals in abundance. The deposits haven't been scratched. Our timber resources are immense and have been employed scarcely at all except for firewood. There is no more promising place in the world for the kind of lumber operators you have developed in this country. The government controls most of the forests and all the minerals and would gladly grant valuable concessions to bring about their development. Recently one of your consuls in Greece

The Farmer as a National Legislative Lobbyist

A Review of the Requests Which He Will Make in Washington

WHEN Congress, disposing of the delays incident to the holidays, gets down to business, one of its first callers is going to be the farmer. And it is almost a sure bet that when the visitor is announced the legislative fathers, looking up from their swivel chairs in mingled respect and admiration, will ejaculate, "Gosh, how you've grown!"

And Congress will be right. The farmer has grown from a mere individual whose only idea of getting the attention of the government was to write a letter to some Congressman, to the dignity of whole suites of offices in the national capital with paid representatives and practical advocates, and from a condition in which he was practically inarticulate to one where he speaks the thoughts and wishes of millions.

Two-thirds of the farmers of the United States are now members of some organization whose one purpose is to promote the interests of agriculture. Consider the fact that the 1910 census showed more than 10,000,000 farmers in this country and it will be seen that when the combined farm organizations unite upon a program of legislation, as they are doing, they will be listened to with considerable respect and attention.

The growth of the co-operative movement on the farms of this country has been traced in a previous article in THE DEARBORN INDEPENDENT. It has been shown that the rate was very slow at first, and that for many years farmer organizations were little more than fraternal organizations with insurance benefits and social features. Then, as is frequently the case in such movements, there came a sharp upward movement. Such an impulse toward co-operation developed that the old organizations could not take care of it and new ones sprang up to supplement them so rapidly that the multiplicity of boards, bureaus, federations and societies became almost confusing.

Under these conditions it was but natural that there was a lack of identity in the programs and platforms of the various organizations. Many of them were local or sectional and since the farmers are not all engaged in precisely the same branches of the industry, nor subject to identical conditions of transportation, availability of credit and proximity to markets, the thoughts expressed and the ends sought varied accordingly. It will be noted, however, in reading over the programs of proposed legislation, that the farmers are of one mind on essential farm questions. If they appear to grope, or even to pull in different directions on other matters, it is only what might be expected and is, indeed, proof of the fact that they have not surrendered their individuality nor sacrificed their right to free thinking.

An instance of this was found several months ago when the country was surprised by the confusion of voices claiming to speak officially for the farmers regarding government ownership of railroads. Group opposed group and the public could not know how authentic were any of the claims put forth in behalf of farmer sentiment. The Farmers' National Council rallied to government ownership and when beaten made a direct appeal to the President for retentjon of the railroads for two years longer. Because of this attitude and because it has been one of the sponsors of a movement looking to the joint organization of farm and labor for the political promotion of common interests, the council is recognized as the spokesman for the radical element of farmers. In this attitude it represents numerous local Granges, Unions and other organizations, notwithstanding that the national federations of such bodies take an entirely contrary attitude. At present, however, it is significant that this is the only farm organization actively working for either government ownership or for an alliance between capital and labor. What one finally infers from a comparison of farm organization programs is that there is no very wide divergence between the radical and the conservative farmers on most of the economic problems and issues affecting them. And a further impression from analyzing these various programs must be the sense that the farmer today is notably less radical than the farmer of thirty or forty years ago.

This inference is as strongly suggested by the things that are not to be found in the platforms as by those that are advocated. The farmers, for example, want no tinkering with the standard of values. They are not for repudiation nor for confiscation. Their thinking is not along the course of socialism. They are firm and staunch defenders of private property, rent, interest and profit.

One need not search far in the platforms of farm organizations to discover what the farmers regard as the primary issue before the country as affecting their interests. It will be found in every program of legislative endeavor. It is the keynote of their present thought and when they go before Congress with it, as they will do very shortly, it will be with a united front. This issue is the right to engage in co-operative farm marketing and buying.

Reference was made in a previous article to the extraordinary spread of farmer co-operation in the last six years, from perhaps 500 to more than 4,000 exchanges or companies doing an annual business of approximately one and one-half billion dollars. So rapid has been this spread of farm co-operation that every national farm organization today believes a life and death struggle is on with organized middlemen which can end only with the destruction of one system or the other, as far as farm marketing is concerned.

The middlemen in turn have attacked the co-operative movement as a "combination in restraint of trade" and have brought several organizations into court for violation of state anti-trust laws.

As a result the co-operative movement finds itself fighting for the legal right to exist and it is backing the Capper-Hersman Bill, about to be re-introduced in Congress, as the means of its salvation. The bill can be described here briefly as exempting farm co-operation from the provisions of the Sherman Act.

Farmers generally agree that to be successful the co-operative movement must follow what is generally known as the Rochdale plan of organization. This involves incorporation and the issue of capital stock. Under this plan, however, dividends are not ordinarily paid to members in ration to the stock held, but are distributed pro rata in proportion to the business which the member transacts through the association. The co-operative theory does not regard such returns as profit dividends in the usual sense, but as savings in cost of distribution effected by the elimination of middlemen's profits. Unfortunately for such organizations, the exemption granted farmers' co-operative societies from the penalties of the anti-trust acts is limited to associations that do not issue stock. The Capper-Hersman Bill proposes to remedy this and to exempt all such co-operative corporations or associations and expressly to permit collective marketing. While all other issues are subordinate for the time to that of farm co-operation, the farmers' platform is extensive and contains many other issues which he deems most important.

The National Grange, declaring its belief in the principle of less government in business and more business in government, opposes the continuance or the rehabilitation of any of the devices by which the government entered into either actual practice of or control of business as a war-time emergency measure and asks for the repeal of any and all laws having this as their object. In particular, the National Grange opposes any effort to continue or resuscitate or resume operations of the United States Grain Administration, the United States Food Administration, the United States Emergency Fleet Corporation, the War Finance Corporation, the United States Housing Corporation, the War Labor Board, the War Trade Board, the National Defense Council, the Public Information Committee, all fair price committees, commissions and bureaus and all similar government instrumentalities. The Grange also lays considerable stress on taxation legislation.

The Grange opposes a general sales tax, supports government reclamation work on worthy projects, advocates the extension of the postal savings banks, the increasing of their rate of interest and the making of every rural mail carrier an agent to receive deposits. It advocates also the operation, either by the government or by lease, of the nitrate plant at Muscle Shoals for the purpose of breaking up the Chilean monopoly on this fertilizer material. The Grange disapproves of any system which denies to any individual the right to work any place where his industry may be needed. It champions farm loan banks and favors a liberal credit plan to enable young men trained in agriculture to obtain land. It would "keep inviolate in the government domain" all natural resources and water power. It also stands for the development of inland waterways with ocean outlets, for the honest labeling of woolen fabrics and for the continuance of a government survey of farm costs.

The National Farm Bureau Association believes in much the same program and goes on record also in behalf of the enforced publicity of business records and a just, graduated income tax. It asks for the regulation of the packers and all purveyors of food products and declares that Federal incorporation rather than public ownership is the only cure for monopoly and privilege.

The Farmers' Union is in agreement with these platform planks but adds other issues. It favors attacking land speculation through the medium of taxation and specifically urges the Federal Government to "levy a tax on the value of land and other natural resources held for speculative purposes." The Union is also greatly interested in the continuation of cost of production investigations by the Department of Agriculture and asks a sufficient appropriation to make this possible. It declares the farmer to be the only manufacturer in the country who is imploring the government to figure out and make public the cost of production of his products. The Union also takes occasion to speak strongly in behalf of the Federal Trade Commission and its work.

The National Board of Farm Organizations supports the essentials of all these platforms. Like all the others it urges the passage of the Capper-Hersman Bill, and it also stands for the strengthening of the Federal Loan System and a system of co-operative personal credit. It seeks likewise a law making compulsory the honest branding of seeds, food, drugs and woolens, a graduated income and excess profits tax supplemented by an inheritance tax and strict immigration laws. It has one unusual plank, however, in that it plans to ask Congress to rehabilitate the war finance corporation to facilitate the export marketing of farm products.

On the radical side the Farmers' National Council stands for the non-alienation of natural resources either by patent or lease; government acquisition of railroads, express, express companies and pipe lines; complete regulation of the packing industry, with municipal slaughter houses near the sources of supply; cheap credit to farmers and land seekers made available through co-operative borrowing; special taxation to check land speculation and tenancy; government owned or controlled terminal grain elevators; taxation of excess and war profits to wipe out the national debt; repeal of all espionage laws and protection of speech and press; living wages to labor; opposition to compulsory military training; greater expenditures for public health and education, particularly in the rural districts.

It is evident, comparing all these programs, that they have relation to the identical problems and that while both radical and conservative platforms agree primarily in farm co-operation they differ in the means they advocate of curing the evils which they see in the industrial organization. The conservatives believe that if they are permitted to engage in co-operative marketing these evils will be overcome; the radical element is not so sure of this and asks for the additional safeguard of government ownership of railroads, elevators and slaughter houses.

No one can study these programs in relation to the great organizations which sponsor them, made up as has been said of two-thirds of all the farmers of the United States, without being impressed by the fact that the American farmer has traveled a long way since the days of Granger movements and Populism, greenbackism and cheap money. He is getting down to the principles of business and in doing so he has found the key to many of the economic problems with which he has contended in vain for so many years. His unity of purpose, as much as his strength, demands attention and respect, and while great interests may oppose him in some of his endeavors, it is certain that he has the power and the prestige to obtain serious consideration for his proposals.

Editor's Note. A third article of this series will deal with the farmer's grievances and the arguments he advances in behalf of his contentions.

What the Farmer Wants From Congress:

Amendment or interpretation of the anti-trust laws which will make it legal for the farmer to engage in collective marketing.

Strengthening of the Federal Farm Loan System.

Interstate Commerce legislation making compulsory the honest advertising and labeling of woolen fabrics, food and drugs.

Development of inland waterways with ocean outlets.

Enactment of co-operative credit plans to provide funds for farmers.

National control of packers.

Immigration laws which will maintain American standards of citizenship.

Operation of air nitrate plant by government or lease for purpose of providing cheap fertilizer.

The appropriation of funds to permit Department of Agriculture to make studies of cost of production of farm products.

Disapproval of any system which denies to the individual the right to work in any place where his industry is needed and at any wage which is satisfactory to him.

Invented Wireless Before Marconi Was Born

By H. O. BISHOP

A DENTIST living in Washington, D. C., invented, patented, and demonstrated wireless telegraphy before Marconi was born. Had it not been for the attitude of big newspapers, and the stubbornness and lack of vision of Congress, this country today would be enjoying the honor, distinction and credit of presenting wireless telegraphy to the world.

The name of this comparatively unknown inventive genius is Mahlon Loomis.

Back in the sixties and seventies he eked out a modest living by plugging the defective molars and making "store" teeth for the politicians and social leaders of Washington.

Dr. Loomis called his discovery "aerial telegraphy." His first public demonstration was made in 1866 from the two peaks of the Blue Ridge Mountains in Virginia, some eighteen miles apart. From each peak an ordinary kite was elevated, connected with an insulated copper wire attached at the lower end to a telegraphing apparatus. The operators of each party were provided with telescopes, with which they could sight from one station to the other and read the signals. When all was in readiness, a message was sent by the doctor along the wire of his kite, and was received at the station on the other mountain top just as though the two kites had been connected with a wire in the ordinary way. In this manner communications were kept up until the fact was thoroughly demonstrated that telegraphing could be done as readily without as with connecting wires.

Shortly thereafter Dr. Loomis made a successful experiment in communicating between vessels. This demonstration took place on Chesapeake Bay. The vessels were stationed about two miles apart. On each vessel was a telegraphic apparatus. A wire was attached to the instrument and one end thrown into the water at a moderate depth. Another insulated wire of much greater length was let down to a greater depth into a colder stratum of water. The two strata of water of different temperatures thus connected to the same battery made a complete circuit and enabled communications to pass between the two vessels without other connections. The experiment was a success. On the same principle he expressed the belief that the warm current of the Gulf Stream, if similarly connected with the adjacent cold water, would afford a means of telegraphing a great distance—perhaps as far as a decided difference in temperature is maintained. At this time Dr. Loomis also discussed with his friends the ease with which he believed it would be possible to telegraph to or from a train going at a high rate of speed.

Thoroughly to appreciate the early discoveries and successful demonstrations of Dr. Loomis it should be borne in mind that it was not until June, 1897, thirty-one years after his successful telegraphing without wires between the Virginia mountains, that Marconi, in England, sent his first wireless message a distance of nine miles.

Subjected to ridicule, Dr. Loomis was constantly pursued by the shadow of bad luck. For instance, in 1869 he had succeeded in prevailing upon a number of Boston capitalists to promise to advance the necessary money to establish his discovery on a commercial basis, when along came that never-to-be-forgotten "Black Friday" in Wall Street, which proved to be the most serious financial panic in the history of the country. His backers lost every dime they possessed.

Still undaunted, this patient and cheerful man came hustling back to his dental office on Pennsylvania avenue to extract molars until he had sufficient money to go to Chicago in 1871, where he talked his invention with such success that moneyed men agreed to finance him. But again ill luck crossed his path. The contented smile of a long-deferred success was yet fresh on his features when that perverse cow of Mrs. O'Leary's kicked over the kerosene lamp, resulting in the great fire which reduced Chicago to ashes and his backers to poverty.

In addition to endeavoring to obtain financial backing from Boston and Chicago, Dr. Loomis made constant appeals to Congress for assistance in making it possible for America to be the first country in the world to establish telegraphy without wires. He worked with that body of legislators from 1869 to 1873, when they passed a bill incorporating the "Loomis Aerial Telegraph Company," which was signed by President Grant. Congress however, overlooked the little matter of appropriating the $50,000 asked for and naturally the corporation never got anywhere without funds.

Senator Sumner, of Massachusetts, introduced the first bill for Loomis in January, 1869. The Senator straddled the proposition and passed the buck to his colleagues in this brief speech: "I present the petition of Mahlon Loomis, D.D.S., of the District of Columbia, who believes that he has invented a new mode of telegraphing, which he submits as a great and valuable improvement upon any former mode known or discovered. He briefly says: 'The nature of the discovery or invention in general terms consists in establishing an electric current or circuit for telegraphing without the aid of wires or cables to form such electric currents and circuits. As in dispensing with the double wire (which was at first used) and using but one, allowing and relying upon the earth to form one-half of the circuit, so now I propose to dispense with both wires and all artificial batteries, using the earth for the other part of the circuit.'

"After setting forth at some length his invention of his theory, he asks Congress for an appropriation of $50,000 under such restrictions as Congress may impose, to enable him during the next year to complete the demonstration. In presenting this petition I desire to say that I perform a duty, and I content myself with remarking that it is either a great case of moonshine or it marks a great epoch in the progress of invention. I do not undertake to express an opinion upon it. I ask the reference of the petition to the committee on patents."

DR. MAHLON LOOMIS

On the night of May 21, 1872, the House took a whack at the bill in quite interesting fashion. The bill had been introduced by John A. Bingham, of Ohio. It was reported that night by Omar D. Conger, of Michigan, chairman of the committee on commerce. In making his report Mr. Conger took an oratorical flight, as follows:

"This theory assumes that the earth iself, the atmosphere surrounding it, and the infinite depth of space encompassing this aerial world, contain a succession of concentric circles or planes of electricity, of which those nearest the earth are perpetually disturbed by oceanic currents, atmospheric changes, alterations of day and night, and the ever-varying effects of solar radiation and lunar influences; but that above these, pierced, perhaps, by the tops of the loftiest mountains, are concentric circles, or vast surrounding seas of undisturbed electricity, which may be affected by any interpenetrating galvanic force from beneath, causing electrical vibrations or waves to pass from that point within such electrical plane around the world, as upon the surface of some quiet lake one wave circlet follows another from the point of disturbance to the remotest shores. So that from any other mountain top upon the globe any conductor which shall pierce this plane and receive the impression of such vibration may be connected with an indicator, which will mark the length and duration of such vibration, and indicate by any agreed system of notation convertible into human language the messages of the operator at the point of first disturbance; and thus, not only from one, but many mountain tops, piercing far above the circumambient atmosphere, the devotee of science and the solemn student of nature may gather the unwritten messages of interest or affection from the silent solitudes of nature and the cerulean depths of heaven with unerring accuracy, and transmit them to the denizens of all lands by the mundane machinery of telegraphic instrumentalities.

"I understand that the highest authorities on electricity both in America and Europe sustain the theory upon which this project is based, to wit: That the earth is negatively electric, and that the atmosphere above the earth is positively electric, increasing in proportion as you ascend above the level of tidewater. The project here proposed is simply to connect the air at a certain altitude (three or four miles, if you please, above the level of the sea) with the tidewater level of the earth by means of wires, thereby completing the electric current."

During the course of his remarks Representative Bingham said: "The only way to know whether what is here proposed is practicable, either for purpose of telegraphy or for the purposes of utilizing electricity for light or heat or motion, is to try it; and there is no way to try it, I apprehend, without some considerable use of capital. I pray the House to consider it favorably and allow it to pass. If no good comes of it there can be no harm, and favorable action by the House of Representatives on the bill will signify to the world that the House is disposed to consider, and not treat with derision and scorn, every endeavor to better in some sort the condition of individual and collective man."

The New York *World* printed this stinging editorial rebuke: "Who will not be edified to know that the time of the House of Representatives was taken up for an hour or more Monday night by an elaborate oration from Mr. Conger, of Michigan, in support of a proposition for establishing an aerial telegraph? And all this the House of Representatives listened to and the *Congressional Globe* gravely prints! And yet there are those who affect to be surprised that men of sense and character withdraw themselves from our public life! When some one asked the philosopher Crates why he took no interest in state affairs he calmly made answer: 'How can I trouble myself about public affairs when they are given over to the hands of blockheads?'"

Another editorial said: "A genius in the District of Columbia has discovered a means of telegraphing without wires or cables . . . Senator Sumner well remarked that the scheme was either all moonshine or an epoch in telegraphing that marked a most wonderful improvement in science. Before Congress appropriates $50,000 to its development, as proposed, it would be well to find out which."

On July 30, 1872, Dr. Loomis was granted a patent covering his invention, the specifications being as follows: "Be it known that I, Mahlon Loomis, dentist, of Washington, District of Columbia, have invented or discovered a new and improved mode of telegraphing and of generating light, heat and motive power; and I do hereby declare that the following is a full description thereof:

"The nature of my invention or discovery consists, in general terms, of utilizing natural electricity and establishing an electrical current or circuit for telegraphic and other purposes without the aid of wires, artificial batteries, or cables to form such electrical circuit, and yet communicate from one continent of the globe to another. To enable others skilled in electrical science to make use of my discovery, I will proceed to describe the arrangements and mode of operation.

"As in dispensing with the double wire (which was first used in telegraphing), making use of but one, substituting the earth instead of a wire to form one-half of the circuit, so I now dispense with both wires, using the earth as one-half the circuit and the continuous electrical element far above the earth's surface for the other part of the circuit. I also dispense with all artificial batteries, but use the free electricity of the atmosphere, co-operating with that of the earth, to supply the electrical dynamic force or current for telegraphing and for other useful purposes, such as light, heat and motive power.

"As atmospheric electricity is found more and more abundant when moisture, clouds, heated currents of air and other dissipating influences are left below, and a greater altitude attained, my plan is to seek as high an elevation as practicable on the tops of high mountains, and thus penetrate or establish electrical connection with the atmospheric stratum or ocean overlying local disturbances. Upon these mountain tops I erect suitable towers and apparatus to attract the electricity, or, in other words, to disturb the electrical equilibrium, and thus obtain a current of electricity, or shocks or pulsations, which traverse or disturb the positive electrical body of the atmosphere above and between two given points by communicating it to the negative electrical body in the earth below, to form the electrical circuit.

"I deem it expedient to use an insulated wire or conductor as forming a part of the local apparatus, and for conducting the electricity down to the foot of the mountain, or as far away as may be convenient for a telegraph office, or to utilize it for other purposes.

"I do not claim any new keyboard, nor any new alphabet or signals; I do not claim any new register or recording instrument; but, what I claim as my invention or discovery, and desire to secure by letters patent, is the utilization of natural electricity from elevated points by connecting the opposite polarity of the celestial and terrestrial bodies of electricity at different points by suitable conductors, and, for telegraphic

(*Concluded on page 14*)

Photo made from original drawing made by Dr. Loomis, in which he sketches the successful experiment of telegraphy without wires.

An Artist of the Films

By JOHN B. WALLACE

WHEN Alvin Wyckoff came into the world his parents—as do all parents—began planning his future. They decided that he would be a surgeon and began dreaming dreams of their boy at the head of a great hospital with other surgeons sitting humbly at his feet and drinking in the words of the master.

Destiny laughs at the air castles of parents. The heir of the Wyckoffs did indeed achieve supremacy but it was along a line little dreamed of in those days. Alvin Wyckoff today, as director of photography at one of the greatest of the many California studios, stands at the head of another profession, a profession which he has probably done more than any other man to elevate to an art.

ALVIN WYCKOFF

Wyckoff, himself, thought he was going to be a surgeon. When he entered the University of Michigan at Ann Arbor he picked the course that would lead to the profession of medicine. One day in an operating room caused him to change his mind. Right then and there he decided that surgery was not for him.

He finished his college course and turned his attention toward the stage, college dramatics having claimed his interest. As director, stage manager and leading man in stock he was fairly successful. At one time he had two companies of his own on the road and while his name was never emblazoned among the bright lights on Broadway he was not unknown in the smaller cities of the East.

But Wyckoff was not satisfied. He felt that his talents lay in other channels than acting. Motion pictures were just coming into popularity and one night after viewing a film he suddenly decided that there lay a field built to order for him. He wrote to the head of a company in Chicago and ten days later was acting comedy parts and later leads before the camera.

However, this was not the angle of the motion picture game in which he was most interested. Amateur photography had always been his hobby and the laboratories at the studio held a strange fascination for him. In those days actors were not allowed in the laboratories at all but Wyckoff sneaked in at every opportunity.

"I'll bet they kicked me out a dozen times a day," he told me.

Finally his persistence was rewarded. He was given a chance to learn the camera end of the motion picture business. He had majored in chemistry at college so film development held no difficulties for him. For ten days he ground away at an empty camera learning to turn the crank steadily, evenly, with no jerks. Then he was put to work taking apart and reassembling cameras. The company built its own cameras in those days and its men had to be expert in both building and repairing as well as operating.

The first picture that Wyckoff was given a chance to shoot was "The Wizard of Oz." He worked on that series for a time when his great opportunity came in the Jeffries and Johnson fight at Reno. All of the experienced men were busy at the time and there was no one to send but Wyckoff.

The tyro made good with a vengeance. He arrived at Reno and before any of his rivals were up the morning of the fight he had erected his stand. As a result he had the choice location. As soon as the fight was over he boarded a train for New York and was the first one to arrive with his film. Notwithstanding that his competitors were some of the best camera men in the country his work was adjudged the best and was accepted. That made him as a camera man. Not long after he left Chicago for Los Angeles.

Among his great pictures are "Joan of Arc," "The Count of Monte Christo," and Rex Beach's "The Spoilers."

Mr. Wyckoff is a chunky-built man of medium height with a dynamic energy, an energy almost Rooseveltian. He has the outstanding personality that would enable one to pick him in any group of men as being somebody. I found him in his quarters, quarters which oddly remind one of a ship with its various decks and brass-railed companionways leading to them. Here light is king and the rays of the California sun pouring through the roof of glass are reinforced by powerful spotlights.

From the bridge of this large structure—further to pursue the nautical simile—Mr. Wyckoff directs his staff of twenty-six photographers. They are practically all men whom he himself has trained. He will accept no applicants unless they have a college or at least a high school diploma. He feels that photography is a profession very closely allied to the arts and he wants only men by whom it will be dignified.

The successful camera man must not only be possessed with an artistic sense but he must be a man of resourcefulness and cool daring. He must be a quick thinker who will act instinctively in moments of emergency. In addition he also must be a man of considerable agility, capable of almost acrobatic feats. Camera men are called upon to take pictures from airplanes, from the tops and sides of moving trains and automobiles, suspended by ropes from the sides of buildings and the masts of ships, in fact from every conceivable angle and perilous position that the requirements of the story they are filming may demand. It is no job for a nervous person or one who cannot stand altitudes.

The camera must always come first. That is the creed of the motion picture photographer. No matter what happens he must keep on turning. As the newspaper reporter's motto is "Get the Story" so the camera man's is "Get the Picture."

Notwithstanding the tremendous strides made in the pictures during the past decade, Mr. Wyckoff believes that as far as the photography end is concerned development has barely started. Wonderful improvement has been made in the mechanism of the camera but there are still vast opportunities for the inventor. Lenses, too, are far from perfect, Mr. Wyckoff says, only one out of twelve of any of the best makes being suitable for good picture work. In still photography it has been possible to achieve marvelous effects by doctoring the negative, but because of the enormous number of prints this is impractical with motion picture films.

"Any improvements from now on will be made inside the camera," Mr. Wyckoff predicted. "Competition is the great incentive for improvement in motion picture photography. As soon as something new is noticed on the screen by other photographers they at once set out to learn how this effect was obtained. In learning the secret they invariably improve upon the original idea. That again puts it up to the man who invented the device to think up something better and so on in an endless chain."

Mr. Wyckoff does not believe in repressing the individuality of his men.

"I encourage originality and initiative," he said. "If a man can get results through using a piece of window glass for a lens that is up to him. He is judged finally and conclusively by what is shown on the screen in the projecting room."

Invented Wireless Before Marconi Was Born

Concluded from page 13

purposes, relying upon the disturbance produced in the two electro-opposite bodies (of the earth and atmosphere) by an interruption of the continuity of one of the conductors from the electrical body being indicated upon its opposite or corresponding terminus, and thus producing a circuit or communication between the two without an artificial battery or the further use of wires or cables to connect the co-operating stations.

"Mahlon Loomis."

At odd intervals from early manhood until a short time before his death in 1886, Dr. Loomis kept a diary wherein he poured out his thoughts on various subjects.

The following quotation from his diary proves that Dr. Loomis was a believer in wireless telegraphy as far back as 1858:

"Washington, D. C., February 20, 1864. I got this little book today that I may collect and put together some papers and ideas that I have had for a long time upon the subject of electricity, and more particularly as that element is connected with telegraphy.

"I have been for years trying to study out a process by which telegraphic communications may be made across the ocean without any wires, and also from point to point on the earth, dispensing with wires. And the grand feature which I have hoped would characterize the plan is that the electricity (or electro-magnetism—the element or power used) would be drawn from the atmosphere, and not produced by artificial or mechanical means. To use that which nature seems to have already produced and keeps constantly on hand in such immense quantities.

"The lightning with its thunder crash seems to be the most powerful and terrible thing in nature. There always seems to be an abundance of this electrical element; and why not use it for various purposes?

"Franklin certainly did draw down electric fluid from the clouds; why not make another draft? By the perfection of appliances there is no doubt in my mind that a constant and never-failing current may be obtained powerful enough to telegraph across the ocean, to decompose water for light (or use the electric current itself for light and for various mechanical purposes). And to this end I wish to write down some facts and ideas, hoping to add more and go further until successful experiments are made and the reality of this dream come to pass.

"In 1858, August 15, I wrote a little paper, which I shall transcribe here: I believe as soon as something can be found to bear the same relation to the earth that a wire does, a telegraphic communication can be made without a wire. What relation does a wire bear to the earth? That is a question to be settled, and one which I must write more about at another time; but it serves to conduct a distinct portion of fluid from point to point, and so on.

"A subdued form of statical electricity may be used for telegraphic purposes. Dynamic and electro-magnetic fluids are both used, but both are chemically or mechanically made. Statical fluid resides abundantly in the atmosphere, and then a structure—say, of points—placed in the air at perhaps cloud height, if of sufficient amplitude, would be a never-failing source of an abundant current. This, then, may supersede the use of galvanic batteries for dynamic and electro-magnetic machines for electro-magnetism; and a great abundance always obtained without any expense but for the original structure.

"As water, especially salt water, and particularly a current of warm salt water, is a good conducting medium, a powerful current of atmospheric electricity may be made to traverse such a path from shore to shore of the Atlantic Ocean.

"The collecting apparatus, or points, may be stationed on the mountains to save building high structures, and thence conveyed on wires to the point of immediate use. And all along this conducting wire the fluid may be taken out and used for telegraphing and reinterred for further purposes. I am confident that some simple apparatus can be devised by which the atmospheric electricity can be collected."

The reader should not overlook the fact that the above ideas concerning wireless telegraphy were written by Dr. Loomis exactly sixteen years before Mr. Marconi was born in Bologna, Italy, April 25, 1874.

Caring for the Affairs of Jugo-Slavia

Concluded from page 11

directed the attention of your lumber industry to the fine market for their products in ancient Hellenes. But why ship your lumber thousands of miles, when you can take your equipment and skill to Jugo-Slavia, just north of Greece, and find all the timber you can handle?

"When our wars began there were only about 10,000 men of college and university training in all Serbia. They necessarily had to take the lead in the war, and are now almost gone.

"We have the labor, the native intelligence, waterways and some railroads, but we haven't the educated skill needed for leadership in developing our great natural resources.

"There is great opportunity in Jugo-Slavia for enterprising Americans."

Many Serbians and other southern Slavs who have lived in America have returned to Jugo-Slavia. In one month recently more than 50,000 passports were asked for by persons desiring to return to that country. But because of failure of industry to revive there as rapidly as was expected southern Slavs are beginning again to emigrate to this country.

The Jugo-Slav legation in Washington is anxious to inform interested persons regarding its country and the opportunities there for trade and industry.

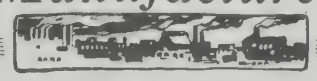
Dr. Slavko Y. Grouitch, the minister in charge, is a man of extensive diplomatic experience. He has perfect command of the English language. He was assistant secretary of state for Serbia during the exciting days of July, 1914, when the fate of the world seemed to, and perhaps did, hang on the notes that passed between the Serbian and the Austrian foreign offices over the incident at Sarajevo. Dr. Grouitch handled the details of the Serbian end of the controversy, perhaps the most important diplomatic discussion that ever took place.

He later had charge of Serbian affairs in Switzerland, being transferred to America early in 1919.

Madame Grouitch is an American woman. She was Miss Mabel Gordon Dunlap, of Clarksburg, West Virginia, when she married Dr. Grouitch. They met and were married abroad when she was studying archeology at Athens, Greece.

The business of the Washington legation is conducted in offices set up in an apartment house near Dupont Circle. The Minister and Madame Grouitch maintain a residence elsewhere in the city.

"It is difficult to avoid superlatives in any description of Serbia," says J. Rives Childs who assisted Herbert Hoover in relieving the distress existing there following the war. "Those who have come away from Serbia after but a few weeks' acquaintance with the country and its people unite with those who have spent long years there in enthusiastic praise of the country and its institutions."



The Three Arts

Agriculture

Manufacture

Transportation

A member of the Kansas board of agriculture announces that a bill will be introduced at the next session of the Kansas legislature prohibiting the operation of boards of trade in that state.

The number of automobiles in the United States is said to be five times as great as at the beginning of the World War.

The Bureau of Internal Revenue calls attention to this section of the national prohibition act, which reads as follows: It shall be unlawful to advertise, manufacture, sell or possess for sale any utensil, contrivance, machine, preparation, compound, substance, designed or intended for use in the unlawful manufacture of intoxicating liquors.

The Hangyang Iron Works, of Hankow, China, a Japanese plant, is shipping steel plates into San Francisco at a price of $4.96 a ton cheaper than Pittsburgh steel.

A company known as Coast Range Steel Limited has just been incorporated with the object of installing blast furnaces and the creation of an iron and steel plant in British Columbia. The company is incorporated for $15,000,000 and plans for the ultimate expenditure of $50,000,000 in the establishment of one of the greatest steel and iron industries in Western America. Active construction will start within six months.

A German concern is now manufacturing a one-passenger, electric chain-gear runabout which weighs 440 pounds. The car will run 35 miles over city streets on one charging of the batteries.

India, after centuries of plowing with a crooked stick, is learning to use American plows and tractors. As a result the Maharajah of Bikanir has offered a thousand acres of land and the salary of a trained teacher to the Methodist mission board if it will send some one to take charge of the agricultural development of his state.

An anti-dumping bill to be introduced in the House of Commons will seek to prohibit the sale of goods in England at a lower price than that of the country in which they have their origin.

The Federal Trade Commission reports that 10 wheat mills hold a monopoly of the wheat flour milling industry in the United States. These mills manufacture more than half the flour used in this country.

A new steamship line has been established between Rotterdam and the west coast of South America by the Pacific Steam Navigation Company. It is reported that the line will serve the Rhine Valley, Basel and Zurich.

The coal mine purchased by the state of South Dakota is now shipping 200 tons of coal a day. Production will be tripled when new track facilities are completed.

A new counterfeit $10 note is being circulated. The bill is about half an inch shorter than genuine currency and instead of being black the face is brown. The number is given as J7509902A.

Reports have been received from Czecho-Slovakia to the effect that a chemical works has succeeded in making a substitute for cork from turf. The substance is said to be equal to cork in every way and much lower in cost.

The government is making efforts to restore the Morgan strain of horses which has become almost extinct.

The United States is far in the lead of other countries in commerce with Chile. The annual report of the superintendent of customs of Santiago shows that we supplied nearly half of Chile's total imports of $146,483,331.

The United States exported 1,150 locomotives during the first eight months of this year, more than twice the number exported annually before the war. Belgium, Italy, Poland, France and Danzig were the largest purchasers.

The American people make greater use of their railroad transportation facilities than any other country. Each year our railroads perform a freight service equal to the transportation of 4,000 tons one mile for every man, woman and child in the United States. A comparison with other countries before the war would show 631 tons in Germany, 430 tons in France, 349 tons in Austria-Hungary and 311 tons in Great Britain. The railroads of the United States perform a freight service per capita more than ten times the average of the European railroads.

During September the daily output of gasoline in the United States was 15,000,000 gallons, according to the Bureau of Mines.

A Berlin newspaper announces that preparations have been made by the German aniline syndicate to erect nitrogen plants in the United States and Japan, and directors of the syndicate have begun negotiations with the two governments.

A "farthest north" wheat designated as "No. 10," which has been grown successfully at the 66th parallel, is announced by the husbandry department of the Manitoba, Canada, agricultural college. It is said to be a cross of the hardiest known Manitoba and Australia wheats.

The Department of States has informed Great Britain it will demand that the United States as well as small nations be given the right to promote industrial development in all lands taken from Germany and its allies after the war. Oil in Mesopotamia is the chief point of the demand.

There were 240 industrial strikes in New York City during the fiscal year ending June 30. The time lost amounted to more than ten million working days.

Co-operative marketing has been tried with successful results by cattle and hog growers of Craighead County, Arkansas. Cattle once sold at from $3 to $6 and hogs at from $2 to $7 below the St. Louis market in this section. As a result of the activity of the county farm agent, the growers began to deal directly with St. Louis in carload lots and their profits went up immediately.

The theory that charring the butts of fence posts and telegraph poles retards decay has been disproved. Experiments show that the charred posts are less durable than untreated ones.

It is reported that Mexico is making extensive plans for the development of her agricultural resources through the education of her present farmers to modern methods and machinery. One of the latest developments of the campaign has been the sending from place to place of a special train, loaded with an exhibit of farm machinery.

The Bureau of Crop Estimates will issue its next crop estimate December 17 at 4 p. m.

The Department of Agriculture has two bulletins, No. 946 and 947, dealing with the care of farm implements. They will be sent free upon request.

The Department of Commerce has emphatically denied rumors that it has advocated the resumption of trade with Soviet Russia.

Chicago bankers have arranged to finance the western live stock to the extent of $20,000,000. Minneapolis, St. Paul, Kansas City and Omaha banks will co-operate. The scheme will hold no profit for the banks beyond eight per cent interest on the money loaned. A corporation will be formed under the laws of Virginia.

The Holstein-Friesian Association of America recently asked breeders to donate 1,000 registered bulls to be placed in the hands of the French Government in re-establishing the dairy business of the devastated sections of Northern France. Seven hundred head have already been offered.

Farm women will be interested in Farmers' bulletin 607, "The Farm Kitchen as a Workshop." The bulletin deals with the advantages of a convenient and well-equipped kitchen.

The government is experimenting in a "more daylight movement" for hens. A common alarm clock switches on an electric light in the hen house before daybreak. The result is a 12-hour day and an increased number of eggs.

Saskatchewan has organized a bureau of industries to develop known resources within the borders of the province.

The Bureau of Mines states that 600,000,000 gallons of gasoline, amounting in value to $150,000,000, are lost annually through evaporation and that half of this is preventable. The bureau will issue instructions showing how the loss may be avoided.

The national railways of Mexico are said to be negotiating with American equipment companies for 300 engines and 3,000 freight cars.

The Silk Manufacturers' Union of Japan has suspended production for three months.

Eight hundred million spools are manufactured in Maine mills every year. Skilled workers and complicated machines turn the product out at the rate of a spool a second. The value of the product amounts to $1,000,000 annually.

Forty million dollars has been paid to the Shipping Board by the War Department on claims totaling $200,000,000. Another item totaling $85,000,000 is under discussion.

Reports have been received from Tokio by the Department of Commerce to the effect that the Japanese dyestuff industry can in no wise compete with American or German products. This is a disappointment to Japan which had levied a 35 per cent import duty to protect home interests. Lack of technical skill is largely responsible for the failure.

Official reports received by the Bureau of Foreign and Domestic Commerce indicate that a number of British firms are canceling shipbuilding orders and that this has had a very disquieting effect on the industry. Constantly rising costs of manufacture are said to be responsible for the withdrawal of orders.

China will send representatives of her silk industry to the International Silk Exposition to be held in New York in February.

The Department of Agriculture believes it has solved the problem of extracting phosphoric acid from phosphate rock by heating mixtures of this rock, sand and coke to a smelting temperature. The discovery may revolutionize the fertilizer industry of the world.

Weather Reports by Wireless

Photo by Gilliams Service

Farmers will not have to depend upon the appearance of the sky or wait for the daily paper hereafter to know what kind of weather they are going to have. The Kansas State Agricultural College has established a wireless weather report service and all the farmer needs to do is to install a simple receiving set and learn how to tune in every morning at 9:55. The photograph shows a corner of the college station.

UNIV OF ILL. LIBRARY
URBANA ILL.

Briefly Told

Alexander McDonnell, who took the first scalp from an Indian that participated in the Custer massacre, and who dug Custer's grave, is dead in Omaha.

Dallas, Texas, has only one horse-drawn vehicle in its railroad station transfer service. All the rest have been replaced by the automobile. The sole remaining hack is hauled by a pair of white horses driven by a dark man who has been hacking over Dallas streets for 32 years.

The gross wealth production of the United States in 1919 was about $54,000,000,000. Of this amount, the cities last year produced about 23 billions, while the other 31 billions came from the ground.

All army conscientious objectors have now been released from custody.

The available water power of the state of California is 9,250,000 horse power and is exceeded only by that of the state of Washington with 9,500,000 horse power.

The Rockefeller Foundation has turned over to the complete control of France an elaborate anti-tuberculosis organization which has been developed at a cost of four million francs.

Statistics show that the export trade of Los Angeles with Latin America has increased 140 per cent in the past four years.

Egypt is again open to visitors after being closed to tourist travel for almost seven years.

More than 3,000 immigrants are passing through New York's Ellis Island station daily. For the fiscal year 1920-1921 more than 1,000,000 will have passed through the station. More than 10,000,000 are waiting in war-stricken Europe to swarm to this country as soon as transportation can be obtained.

A Seattle woman is colonizing a fertile island about 40 miles south of Mazatlan, Mexico, where she has a 7,000-acre holding. Twenty-nine farmers and their families from Arizona will sail for the island soon.

There are more than 22,000,000 widows in India, one-third of whom are under fifteen years of age.

The United States has one infantry division, or 12,000 men, upon the Rhine, two years after the close of the war.

Chicago has less than half the building trades workers it had six years ago. There is a shortage of 100,000 homes in that city.

A cargo of horses, the pick of the best herds of Idaho, Montana and Nevada, has been sent to China to improve the native stock of that country.

After four years the ban on bull fighting in Mexico has been lifted.

Born on the battlefields of France an American army mule was smuggled to the United States and is the petted mascot of the doughboys of Camp Travis, San Antonio, Texas.

A humpback whale with two hind legs was recently captured off the coast of British Columbia. The bones of the unique appendages were sent to the American Museum of Natural History in New York. Scientists believe that back in prehistoric ages whales roamed the land as well as the sea.

A cocoanut palm of the tropics booms like a gun when blooming. The spathe or flower case is of a hard woody substance from four to five feet in length, and when this case bursts to release the bloom it is like the report of a firearm.

Certain Boston stores have offered to employ soldiers and sailors who lost their eyesight as a result of the war. Certain departments will be set aside for these men. The state commission for the blind is co-operating in the venture.

The Italian ambassador to Brazil is framing an agreement with that country to protect Italian immigrants with a view to stimulating Italian immigration.

The number of births recorded in England and Wales during 1919 was 692,438. This is at the rate of 18.5 per 1,000 of population.

Italy is combating illiteracy by establishing 2,000 new schools. One hundred thousand teachers are needed, of which 80,000 have already been engaged.

Admiral McCully, at Sebastopol, Crimea, reports that seventy-five cents in American money on October 8 was worth about 18,000 rubles, or about the cost of one pair of cotton socks.

Alaska Indians in the Copper River district face starvation because the canneries net the salmon at the mouth of the rivers. Salmon for the Alaskan natives is absolutely necessary, not only as food for themselves, but for their dogs.

The total number of American soldiers gassed during the World War, excluding marines and sailors, was 70,552, of whom 1,221 died and 2,853 were discharged as suffering disability from gassing.

By controlling the period of light each day scientists have discovered the possibility of advancing or retarding the growth of plants, enabling florists to get poinsettias ready for the market by Christmas, and causing iris to bloom in December and chrysanthemums in the spring.

Only one-third of the newspapers issued in 1919 were printed on the product of American forests. High cost of pulp and paper mills prevents the manufacturing plants from following the timbers as do sawmills.

Nine cents a pound was the price of brown lignite coal of a low heat value sold recently on the curbs of the popular streets of Vienna.

Of the $8,000,000,000 of money in the country approximately $5,500,000,000 is in circulation.

Twenty colleges and universities of the United States and seven colleges and high schools of Mexico have arranged an interchange of scholarships and are to exchange lecturing professors. Mental alertness is all that is required to win the scholarships, and all classes are encouraged to compete.

Seaweed may be used for fertilizer, braided for fishlines or cord, or burned for iodine content and carbonate of soda in its ashes.

German professors hard hit by heavy taxation and the high cost of living are selling many rare and valuable volumes from their private collections. These are purchased, for the most part, by the Louvain Library, which was looted of priceless volumes during the invasion.

Volcanic eruptions of mild intensity have fired three mines near Fayette City, Pennsylvania, causing $3,000,000 damage.

The American Relief Administration will distribute one hundred thousand pairs of shoes, one hundred thousand pairs of stockings and three hundred and forty thousand suits of boys' and girls' underwear to needy Austrian children this winter.

The Proprietary Association, composed of more than 200 manufacturers of proprietary medicines, are planning to drive from the market the manufacturers of medicines of such high alcoholic percentage that they are used as beverages.

Prizes amounting to $44,000 in gold will be distributed at the poetry championship contests to be held in Buenos Aires in 1921. The poets of all Latin America are invited to participate, the prize winners to go to Argentina at the expense of the Argentine Patriotic League.

Prominent scientists believe that the time is coming when ships will be without chronometers and will be in constant wireless touch with all ports, guided only by wireless.

Two million marks to promote scientific research in Germany was the recent gift of a Japanese millionaire to the German Government.

Headstones, of a design suggested by the fine arts commission, are to be provided for the unmarked graves of all who served in the army, navy or marine corps of the United States. These stones are to be furnished free by the government and shipped, freight prepaid, to the railroad station nearest the grave. Full information regarding this service will be published in the *American Legion Weekly*.

The Negro population of Baltimore is 108,390; the white population is 625,074.

The Madness, Sadness and Gladness of Christmas

IT IS a commonplace so trite as to make its repetition risky that Easter has become the feast of the milliners; Thanksgiving the red-letter day of the gormands; and Christmas the jubilee of the merchants.

No better proof of this is needed than the now frequent saying, "We had better skip Christmas this year," by which is meant avoidance of the shopping madness, the purchasing fever, from which all have suffered in other years.

Our gifts are often amiable cynicisms, wrung out by custom, tributes paid to an "annual holdup" dimly supposed to be entangled somewhere with good will.

Christmas is Christian, and it has been made pagan. Christmas is spiritual, and it has been made material. Christmas is the anniversary of an eternal event; it has been made the orgy of a passing phase.

We have erred in making Christmas always "merry," when really it has its sadness. Christmas has been made exclusively the day of the children, when really it is more the day of the mature. Not only Christmas, but every day, should be "merry" for the children, for they are at the merry time of life. But Christmas is a time for adults also. Indeed, the First Christmas was exclusively a day of adults—the adulthood of the fields and the heavens and the homes of Bethlehem dominating the scene. With the children it is always "this Christmas" or "next Christmas"; with the adults it is always, last Christmas, or many Christmasses ago. That which is anticipation to the young becomes memory to their elders. And if we could weigh the sentiments of the day, tender sadness born of the memory of other Christmasses would press down the scale.

The cartoonists rarely limn a Christmas thought without a tinge of sadness—the bare garret, the empty stocking, the poor child. Goodfellow clubs, for all their heartiness and zeal, finish their work in a mood of infinite regret. And those whose good will takes the form of dinners to the poor, are conscious how small a dent one dinner makes in the problem of the world.

This sense of futility has no other cause than our materialistic idea of Christmas. We have reduced the season to the sordid level of Things. The modern Christmas card is the price tag. Materially the day is a mockery: spiritually it may become the first day of a New Age.

If Christmas is but a fashion, it may well vanish in its present form; if it is a Festival, it can remain so only to those who know what it commemorates. There is enough joy in the fact of Christmas itself to infuse all the warmth and light of the merriest Yuletide tale, in any family that dares to live the festival from the heart instead of from the purse. Unless parents can heap the bedsides of their children with mounds of fragile toys, whose tawdry life is brief at best, they feel that something is amiss. Unless friends can exchange presents extravagantly, they feel that somewhere they have failed.

It would be hard to conceive a more disconcerting act than to halt the throngs of "worry Christmas" people and to demand of them—"What is it all about?" They would not be able to tell. They change the style of their bonnets because Spring appears. They gorge themselves on the last Thursday in November because harvest is gathered. Why do they upset the tenor of their lives, and crimp themselves financially, and undergo keen distress of mind on the 25th of December? Why do they do it? What is the cause of this phenomenon? It is not the New Year. It is not the anniversary of a national event. What is it? How many, thus suddenly challenged, could account for themselves?

The whole gladness of Christmas consists in knowing the true "why" of Christmas. There are some people to whom Christmas does not belong. These are, for the most part, its spoliators. They may spoil it as much as they like for themselves; it never was theirs anyway; but we should not let them lure us to spoil it for ourselves.

Christmas tells us, for one thing, that goodness is always being born into the world, that in the cradles of the world the hope of the world is dawning. Christmas tells us that earth is not a lone planet swinging wide in a void of law and matter, but is near enough the throne of spirit to catch the music and reflect the light. Christmas tells us that the beginning of joy was a Gift, and that not of ourselves, but from another plane to this. If we know this message of Christmas, we are then free of the slavery of Things.

Joy is free to come from its only source, which is from above us, not below; and Peace comes upon us, which is the mother-spirit of Good Will to Men. And from Good Will come the best gifts of all—those which carry with them the heart of the giver.

Many Men of Many Minds

Charles Garland.—A system which starves thousands while hundreds are stuffed condemns itself. A system which leaves a sick woman helpless and offers its services to a healthy man condemns itself. It is such a system that offers me a million dollars. I have had to choose between the loss of private property and the law which is written in every human heart. I choose the one which I believe to be true.

J. C. Mohler.—It would be erroneous to assume that the rapid decline in the price of wheat this fall was not a factor in the reduced acreage planted. The majority of correspondents frankly state that the condition of the market commends conservation and particularly in view of the possibility of high-priced labor for low-priced wheat next year.

Italy's New Envoy Has Kind Words for United States

Rolandi Ricci, Italian ambassador to the United States.—I am overjoyed to go to work with a people I have admired since my earliest boyhood. We Italians, who became a nation by cultivating those ideals which inspire Americans, find in the United States the basis of psychological, moral and cultural affinities, which allow us to work willingly and with enthusiasm by their side. In the country of Washington and Lincoln, a man born in the country of Mazzini is never a stranger. I propose to contribute with all my power to cementing the commercial relations between the two countries, but I do not trust my efforts as much as I do the voluntary help which I hope the greatest commercial organizations of both Italy and America will give me.

Edwin A. Alderman.—Education is inherent in the very word democracy. The two are interdependent and inseparable. In so far as education permeates society, just so far and no farther does that society go toward the achievement of true democracy. With universal suffrage—and that term has a juster and more portentous significance since the admission of women to the vote—it would seem beyond dispute that education comes first among all the obligations of the state.

W. G. Swaisland.—It is improbable that at any previous time in the history of the Dominion the credit structure of the country has been put to a more severe test than during the present autumn. Demands for commercial and industrial loans have been very heavy. The financing of this year's crop has made a heavy drain upon resources. Financially Canada is healthy. We are producing what the world needs, and we have vast resources for production. However, caution must not be foresworn.

Gabriel D'Annunzio.—I am Gideon. Let those who lack courage desert me. Let those retire who fail in resenting with iron will. There remain the brave with Gideon, and Gideon's brave will conquer.

Rev. B. B. Bourchier.—I am no kill-joy, but a giddy and flippant people never can carry the burden of England's empire. National frivolity can only issue in national collapse.

W. S. Kies.—Belgium has almost completely come back, industrially and economically. The efficiency of labor has greatly increased during the past year, and Belgian industries are rapidly approaching pre-war efficiency.

Rudolph Dreitscheid.—Germany's collapse was not due to the pacifists, but to the men who praised war as the fountain of youth and the bath of steel. I predict the time will come when the present treaty will be replaced by an instrument dictated by true justice.

Winifred Kirkland.—We owe psychic research exactly the same respect that fair-minded people pay to all new science, however startling or repugnant its revelations—but we owe it no more respect than that. Unfortunately, it is exactly this further veneration that most spiritists demand. To honest inquiry all things are possible. What we demand of the investigators of psychic phenomena is that they shall be as ready toward explanations so-called natural, as toward explanations so-called supernatural.

J. H. Thomas.—There will be plenty for a labor government to do and no one knows better than labor that the tasks before it cannot be achieved by wizardy or the making of clever speeches. But the rulers of today need have no fear of the fitness and ability of the rulers of tomorrow. The employing classes have no monopoly of brains, and labor has not only brains but also experience—practical experience of the everyday work of the great mass of the population, and the great and inspiring task of the labor government will be to do its utmost toward making the country which was worth fighting for a country which is also worth living for.

John Spargo.—That any general strike attempted in England as a development of the coal miners' strike would have signally failed to accomplish its purpose of forcing the surrender of the government, I am quite convinced. As long as there was simply a struggle by the miners for a wage increase the British people would bear the hardship and suffering involved and, upon the whole, sympathize with the miners. Let that struggle broaden into a general strike with political aims, a struggle against the supremacy of the state, and quite another tale would have to be told. Recognition of that fact explains the abandonment of the coal strike.

Francis H. Sisson.—Neither the banks nor the government can create credit. Credit is the product of enterprise and operation in commerce, and is limited and defined by the nature of such operations. Wealth consists of goods and service. The vast destruction of wealth occasioned by the war can be replaced only by creating new wealth, not by creating more credit. We can make up the deficit only by producing more goods and service.

Albert W. Atwood.—Socialism as the synonym of slavery has been written so large and clear for so many years now, even before Russia clinched it, that there has been at first a gradual and more recently a rapid shift away from old-fashioned socialist ideas except in the Russian experiment.

Newton A. Fuessle.—Nobody wants to relax; nobody wants to ruminate, or drowse, or dream. We dance ourselves weak and play our way into the jungles of fatigue. We rush away on vacations with enough sporting paraphernalia to burden our biceps and our backs to the breaking point. The fortnight of theoretical rest becomes a period of hard and destroying labor. We haven't sense enough to take a rest. Even a dog knows better.

Senator Charles S. Thomas.—As conditions are now your Congressman is compelled to work with both ears to the ground, one listening to the demands of the special interests in Washington, the other trying to sound what the folks think back home.

Individual Thrift Is Needed in This Country.

Clarence W. Barron.—What we need in this country is thrift. But you can't get thrift without mutual service. Labor and capital must serve each other. We need more thrift in the government, more in the corporations and more with the railroads. But it is all a matter of individual thrift. Without individual thrift you cannot have efficiency with the individual, the corporation or the nation. Thrift is production and saving, and where you work and save, there is efficiency. Saving is the key to the whole situation.

James Edwards.—The investment field, at the present time, embraces such a large variety of securities that intelligent knowledge on the part of the investor can only be gained by making special and intensive studies of each of the different classes of investments. To the investor the security of principal is, or should be, the prime requisite of an ideal investment. Safety is the cornerstone of success in every security transaction, and in the final analysis, safety of an investment depends upon the amount of property in good condition owned by the company, the total capitalization, the earnings, and the priority of the issue in question.

Fred I. Kent.—In the solving of the world's problems it is just as necessary that America learn to work conscientiously, to stop spending, and to save, and so help to do its part toward making up the huge deficit in the world's material requirements that has been caused by the war, as for Europe. It is therefore important that, temporarily, America be called upon for long-time loans for strictly essential purposes only.

Arno Dosch-Fleurot.—The Bolshevik régime has been able thus far to maintain an army of considerable proportions by throwing it *en masse* against the enemy. It is without sufficient military tactics or discipline to operate any other way. Thus you will be able to see that it was handled that way during the recent Polish fighting and in the same way against Wrangel.

France Returning to Work, Piles Up New Savings.

Harvey Middleton.—The spirit of France has never been more strikingly exemplified than in the vigor with which she is now pursuing her plans for the regaining of her rightful place in the markets of the world. In the first nine months of 1920 the adverse trade balance of France had decreased 36 per cent as compared with the same period in 1919. Seven million individual savings bank accounts are eloquent testimony to the fact that France has gone back to work.

Anne Gilbert.—We farm women would like improved mail service, for, in spite of current belief, rural mail routing is very poorly planned, and on many days of snow, of rain, or of mud, we do not get our mail. But most of all we want better—far, far better—schools that our children may have the best advantages in education that are available anywhere; that they may grow up to be well-educated, thinking, loyal American citizens, whether they choose to live in the city or in the country.

Floyd W. Parsons.—It would be just as absurd to try to catch the wind with a net, or hide the sun with a sieve, as to try to solve the problem of industrial accidents by first aid to the victims. Early precaution is better than late repentance. Emancipation from the ills of industry can come only through educational campaigns such as that fostered by the National Safety Council. There can be no higher goal or more noble aim for any movement than that of conserving the most precious thing in the world—human life.

Otto Schoenrich.—There can be no doubt that the American spirit of common sense and fair dealing will eventually assert itself and that Santo Domingo and Haiti will yet have occasion to praise American administration, generosity and justice.

Mrs. Andrew J. Holmes.—The essential of good health is pure, fresh air and plenty of it. Go into the average home, and you find the inmates languid, disinclined to exertion and "all tired out." The reason this is so is that indoors we usually live in an atmosphere which lacks in life-giving oxygen and which is charged with carbon dioxide, a poisonous gas continually being thrown off by each member of the household, together with disease germs that are seeking lodgment in constitutions in which the power of resistance to their inroads has been reduced to a minimum.

Duke of Devonshire.—We talk a great deal about our natural resources, and a great deal about our opportunities; but what is the use of any of them if we have not the men and women capable of making use of them? The universities have been the training ground for those who have gone out and added to the stores of knowledge, and more and more we must look to the university to bring out in greater degree than ever those men and women who are qualified for this purpose.

William H. Remick.—The exchange is very much alive to the dangers of the circulation of rumors of false information tending to influence security prices in either direction, but it must be borne in mind that it has no control over the minds and speech of citizens who are not members of the exchange.

Where Christmas Takes Place of "The Fourth"

By H. G. TINSLEY

IN THE cities of the South, as in the cities everywhere else, the custom of gift-making is widespread, but in the country districts it has taken small hold. Everybody keeps open house during Christmas week, indulging in hospitality to the extent of his means and often beyond; but the buying of comparatively useless things to avoid feeling uncomfortable when others bring you equally unwelcome gifts is not regarded as a duty.

Christmas on the plantation begins some time before it is indicated by the calendar. In the old days no planter dreamed of requiring anything more at the hands of his workers during December than to kill hogs and get up a noble woodpile, not only for the convenience of the home and its guests, but to keep the Negro quarters comfortable. That custom still obtains, and the sound of the woodcutter's axe and the whir of the belated cotton gin are the only intimations of labor in the country.

Some few others are busy, the gleaners, who have obtained permission to pick the "scatterin' cotton" that has opened too late and at too long distances apart to make it worth the owners' while to hire hands to pick it. This "scatterin' cotton" is a great feature in the matter of Christmas money. It is picked almost exclusively by women and children. Sometimes industrious gleaners, who watch each tardy boll covetously, get together as much as two or three hundred pounds. Then the delight ensues of bearing that cotton to town, and indulging in reckless expenditure.

In Christmas week the small towns throughout the country are quickened to almost metropolitan exhilaration. The whole country empties itself into them, except the better class of women, who seldom appear on these occasions. The small farmers, the crackers, the Negroes and their respective families enjoy to the full the excitement.

The gleaners' cotton is not the only resource for Christmas money. Eggs in large numbers are carried to the grocerymen, butter, tierces of lard, links of sausages, "scaly barks," chestnuts, pecans, persimmons, chinquapins, dried fruit of all descriptions, glut the market. Turkeys may be had at the lowest price, and tall, lean, long-visaged men, with unkempt beards straggling over their homespun shirts, will bring in bunches of skins, rude cages full of live "partridges," and clusters of rabbits and squirrels tied on sticks slung over their shoulders. Barefooted boys accompany them, boys uncouth and shabby and tattered, but blissful withal, and keenly interested in the contagious stir and bustle.

The small farmers' wives, who come into the stores to trade, collect around the stove and exchange neighborhood gossip with the clerks before their business is transacted. The men have an unvarying habit of disappearing with the proprietor into mysterious regions above, whence they presently emerge wiping their lips, and in a most satisfactory condition for the conduct of business affairs. The goods in that particular proprietor's shop may or may not be all that is boasted for them; but the quality of the liquor he uses for treats during Christmas time must be satisfactory or the tide of business is diverted.

The Negro woman who brings in the "extra crop," accompanied by a procession of sons and daughters has much ado to invest the limited sum of money that the cotton will bring. There are so many needs to provide for. Criticism is disarmed if, when she counts the scant coins in her uncertain fashion, she is impelled to ignore the necessaries and make a wild plunge into the realm of the unnecessaries. She has so little, she desires so much. Try as she will, her exchequer would not purchase a frock apiece for her "pics." Small wonder that she leaves them to blissful shreds and tatters and secures for one a cloth doll, for the youngest a rubber rattle, for another a green and yellow cow on wheels, and for the others striped mint candy, picture books and firecrackers. She buys sugar and raisins for Christmas cake and takes her share of the earnings in a lace-trimmed white apron.

"I reckon I kin git flour and a piece ob meat from Miss Susan," she calculates, as the party take their way home, and "Miss Susan," the matron on whose land she lives, is seldom of a mind to refuse.

"My hens ain't layin' none 'tall right about now, but I cackilate to fetch you a dozen or two eggs long 'bout corn plantin' time," she says, apologetically, as she accepts the flour and meat, and "Miss Susan" smiles indulgently; she is accustomed to these delusive promises.

"We are not responsible for these people any more; they must learn to look after themselves," protests "Miss Susan's" spouse, when mention is made of the extra drain on the Christmas pantry. But "Miss Susan" convinces him that she could not enjoy Christmas knowing that these poor people were in want.

"Think of it! All those children to feed, and the husband such a trifler. I feel sorry for Di. She was Maum Patsy's oldest girl, and well brought up. As long as I have anything she is welcome to share it."

The shipping facilities in the small towns do not admit of sending all the Christmas wares, the turkeys, and so on, to a bigger market, so when the local demand is oversupplied curious devices are resorted to to get rid of the superfluous supply.

For a "turkey walk," volunteers whose entrance fee will make up a fair price for the bird are blindfolded, and thus hampered try to walk as near a certain stake as possible. The walker who gets nearest to the stake wins the bird. When a number of turkeys have been won in this fun-provoking fashion they are handed over to a first-class cook, and a supper, eaten by all the participants, winds up the affair.

Out in front of an isolated country store is the famous place for a turkey-walk, and any afternoon during Christmas week such festivities are likely to occur. A certain number of pegs are prepared, and each walker, after vainly trying to approach the goal, sticks his peg in the earth where he stops. After the volunteer is blindfolded he is turned around three times, then told to go straight for the stake. Invariably he blunders in exactly the opposite direction, eliciting shouts of laughter from the circle of bystanders.

Possum suppers are another famous diversion with the young men, and some Negro cook in the neighborhood is sure to have acquired a reputation for cooking possum "just to a turn."

Shooting for beef is another game of hazard. The live beef has a value set upon him by his owner. The shooters take as many chances as they please, each chance implying a shot at the target. The man who hits the bull's-eye takes his choice of the best portion of the beef. The shooting is done with a rifle. The winner may give his prize to be shot for again, and the sport often lasts throughout a whole morning or afternoon.

Christmas trees and "festivals" are an important feature in the holiday season. On a big plantation of, say, 5,000 or 6,000 acres, there will be several churches and schoolhouses; each of these will have a tree in turn, and will lend decorations to those that come after.

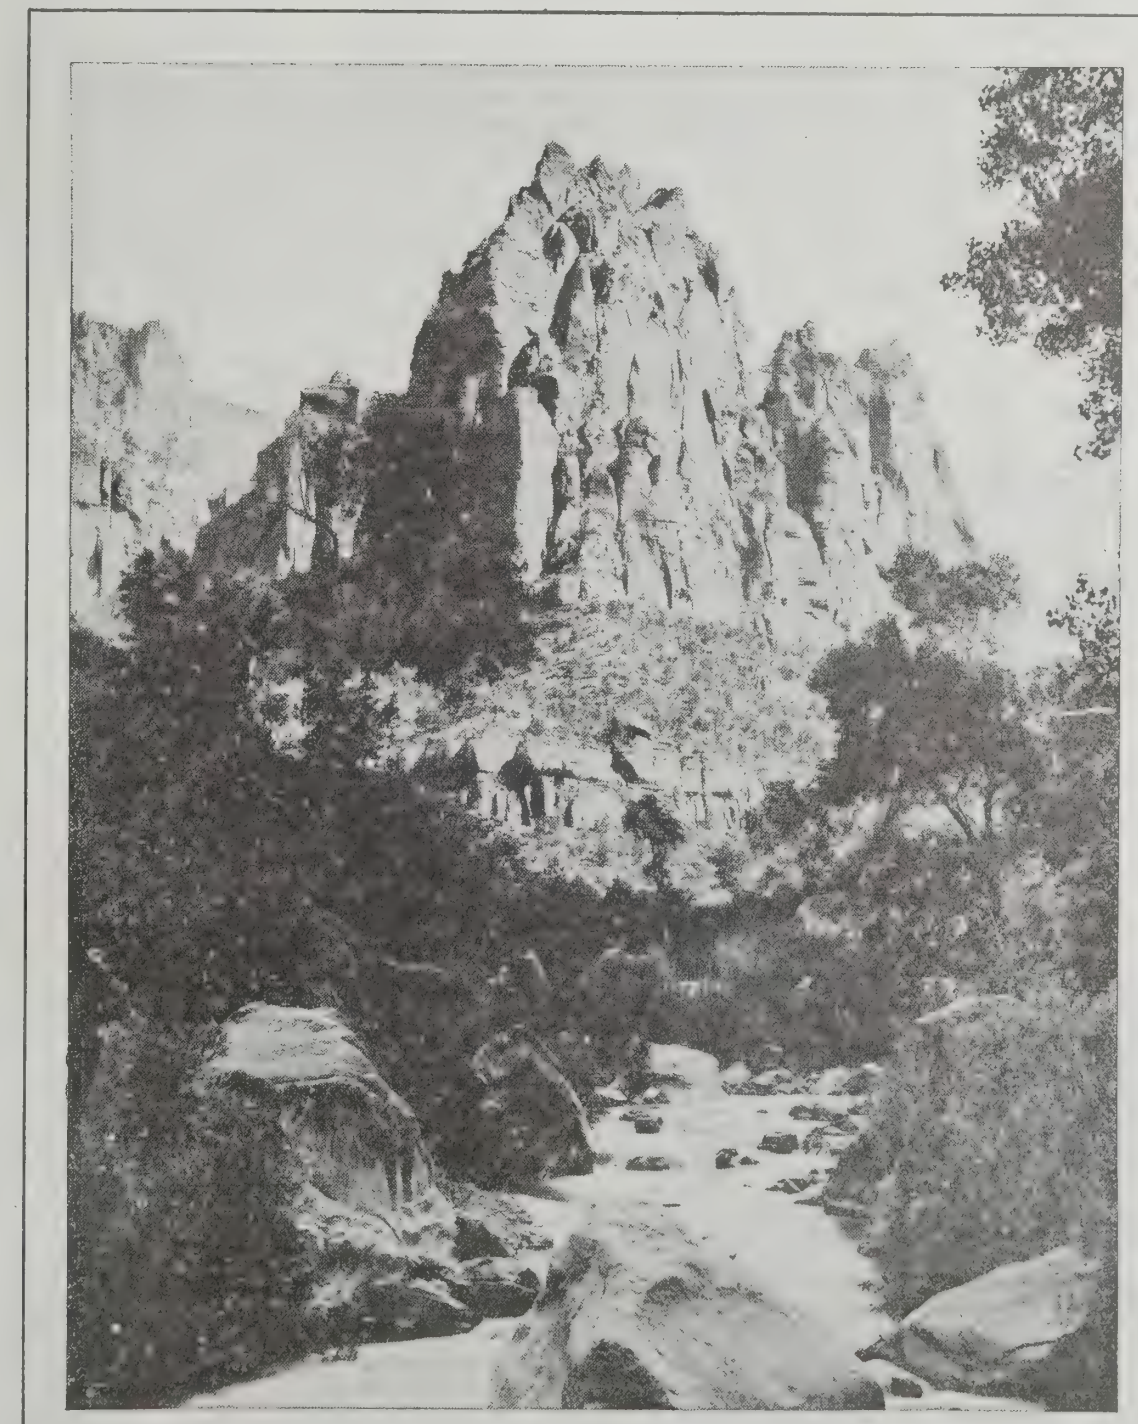
People accustomed to the fairylike typical fir tree with its dazzling lights and beautiful gifts would be partly amused, partly saddened, over these grotesque Christmas trees of a new growth. Flags left over from turbulent political campaigns, snips of selvedges of gay-colored flannels, bedraggled sash-ribbons, frizzly plumes, mutilated Chinese lanterns—anything and everything that would add at all to brightness of effect, are among the queer fruits on this marvelous tree. Popcorn, tatters of tinsel, sugar-apples, oranges and monstrosities in the shape of sugar fish and birds, with a sprinkling of bananas and oranges, make up the collection. Tapers of any kind are too expensive; the tree gets light from a collection of lamps rigged up on a high table behind it. The gifts are clustered at the base. Great vigilance is needed on the part of the superintendent, because movable articles have an odd way of disappearing on these churchly occasions.

Those who are not able to pay the small entrance fee stand outside and peer at the forbidden fairyland within. They know that when the principal feature of the evening is over they can go in and join with their more fortunate brothers and sisters in the frolic that follows, and that is the main thing after all.

The Negroes never dance except singly, but they march or promenade to a weird, wordless sort of ululation, now soft and low, now shrill and piercing. It is late in the night that this odd marching begins. There is always a leader of such sports on every plantation, a man whom the others regard as a natural impetus of fun.

This personage takes his stand in the middle of the floor, flourishes his new Christmas handkerchief and shouts loudly "March! march! ladies and gent'emums; who gwine march 'long ob me?" The company huddles together and watches the turn of events with breathless interest. The girls giggle and nudge each other, each hoping to be chosen, but, demurring at seeming forward and unmaidenly, hesitation loses them the chance.

"Aunt Fanny" copper colored, sturdy, with gray wool knotted close beneath her bandana and a wide reputation as a "high stepper," advances from the circle and places herself at the leader's side, a volunteer partner.



"Dem young gals is so kittenish, holdin' back, dat fashion!" she murmurs.

The leader takes her hand, other couples spring up as if by magic, and the Christmas march begins. Faster and faster they go, louder the chanted song ascends; occasionally a couple falls out and seeks a bench outside to recuperate, and, if the beau's pocketbook admits, to regale themselves on cake and lemonade. But the cocks are crowing for morn before the party breaks up.

Noise is, after all, the great thing on Christmas. The Fourth of July is not observed to any extent "down South"; the pent-up enthusiasm of the entire year effervesces on the 25th of December.

The cotton fields have not yet struggled to light out of the gloom, nor the

(Concluded on page 12)

Brown Peak, at south end of Zion Canyon, Zion National Park, is the newest member of the national park system. Located at the southern edge of Utah, it is noted for its vividly colored and fantastically carved sandstone cliffs bordering a deep gorgeous valley of about the same dimensions of the famous Yosemite. To quote Jack Lait—"Zion Canyon is an epic, written by Mother Nature in her most ecstatic humor, illustrated by Creation in its most majestic manifestations, published by God Almighty as an inspiration to all mankind."

The Ford International Weekly

THE DEARBORN INDEPENDENT

Published by
THE DEARBORN PUBLISHING CO.
Dearborn, Michigan

HENRY FORD, President.
C. J. FORD, Vice President.
E. B. FORD, Secretary-Treasurer.

Twenty-first Year, Number 8, December 18, 1920.

The price of subscription in the United States and its possessions is One Dollar a year; in Canada, One Dollar and Fifty Cents; and in other countries, Two Dollars. Single Copy, Five Cents.
Entered as Second-Class Matter at the Post Office at Dearborn, Michigan, under the Act of March 3, 1879.

CHANGE OF ADDRESS

To receive your copy without interruption, please observe the following:
1. Notify us at least two weeks in advance.
2. Give both *old* and *new* address.
3. Write clearly.

To the Reading Public

JANUARY will find THE DEARBORN INDEPENDENT completing its second year as a weekly magazine. Youngest of all periodicals of importance in point of years, it has nevertheless been favored with an exceedingly gratifying amount of public approval and has consequently experienced a most remarkable growth.

It has given more space to interesting, informative and dependable reading matter than any weekly in the United States and has done so at about one-fifth the average cost of other publications. It has been straight reading from cover to cover and it has maintained an individuality in its columns which has been approved in a most gratifying number of American homes.

Readers of THE DEARBORN INDEPENDENT have, of course, been aware that the subscription price of $1 is inadequate to meet the cost of producing such a magazine. They are sufficiently well informed to know that advertising matter is relied upon by periodicals for a large share of their operating expenses and for their profits. THE DEARBORN INDEPENDENT has accepted no advertising. It has sacrificed that revenue that there might be no question of the absolute sincerity of its motive and the independence of its thought.

Having established the worth of THE DEARBORN INDEPENDENT to the satisfaction of the reading public, it is felt that an increase in price which will distribute the cost of publication more evenly, will now merit no disapproval.

Beginning January 1, 1921, therefore, the price will be advanced to $1.50 a year.

Time for Careful Pruning

THE Sixty-sixth Congress, one of the most memorable in the history of the republic, is in session for the last time. It has little more than two months of life left. But before it dies and passes into history it has important duties to perform and one of these is to pass upon appropriations for the next fiscal year.

The estimated expenses, as calculated and presented by the various government branches, amount to almost five billion dollars, with the army and navy leading in requests for high increases in their appropriations. So great indeed is the amount sought by these two wings of the national defense that, if granted, every resident of the United States, children included, would be taxed $13.72 to pay for their maintenance.

It goes almost without saying that these requests will not be met in full. In the first place Congress always pares departmental budgets and in the second place a Republican Congress is not likely to deal very tenderly with the suggestions of a departing Democratic administration. These facts should serve to lighten the dismay which the average taxpayer will feel when he scans the list of requests and notes their stupendous total.

There are departments, of course, which do not deserve to see their requests slashed. Congress, for instance, cannot afford to cripple the Department of Agriculture at this time, nor should it consider curtailing the activities of the various research and educational bureaus. Not only is their work very valuable, but their expenses are trifling, compared with the aggregate government expenditures.

Congress, however, may well raise a question of why such gigantic war appropriations are deemed necessary when the nation is at peace, and hopes to remain at peace, with all the world. Surely no foreign policy of which the public has been made aware commits us to an expenditure of more than one and one-third billion dollars upon our naval and military forces.

Again it will do no harm if Congress will scrutinize with the greatest care any recommendations involving new enterprises or new policies which will necessitate the expenditure of large sums. It is hard enough for the average taxpayer to raise his share of the sums necessary to keep the government functioning in all its present branches and at the same time to make progress in paying off the obligations left by the war, without opening any new ways of spending money.

Besides, it will be well to avoid five billion dollar Congress. We might become addicted to the habit.

Do We Need It?

AN INTENSIVE campaign designed to bring about the re-establishment of the war finance corporation, an emergency organization created under the stress of war, has been under way through the entire country, and with some hope of success, it is learned.

It is exceedingly doubtful whether the good that could be performed by such a body would counterbalance the possibilities of evil through maladministration. The appeal to re-establish this war creation has been along the most effective lines, and has enlisted the interest and in some cases the approval of Senators from the agricultural states, who without question have been influenced by the declaration that the war finance corporation can do much for the country in affording "relief for the farmers."

Hasty action, without the most thorough investigation of the reasons advanced for the renewal of the functions of the corporation, together with an inquiry designed to throw into relief the figures most responsible for agitation in favor of the proposal, and their motives, should not be taken by Congress.

Begin Each Day Anew

A PROMINENT business man, who always seemed fresh and full of vim and vigor, although he had a multitude of cares in the corporation with which he was connected, was asked one day how he managed to keep himself in such good physical and mental condition, free from worry and distraction. His reply is well worth remembering:

"I retire from business every night when I leave the office," he said, "and begin business afresh, every morning."

In other words, he meant that he did not allow the cares and worries of business to stand over him as a threatening menace when the day's work was done. When he left the office, he literally retired from business until the next morning. His home life, his social duties, his pleasures, were never tinged with the thought of the perplexing problems that the next day was sure to bring. By this method, old age was kept at a distance, worry was a stranger, and each day was begun anew with a fresh inspiration to meet and overcome the difficulties which might arise in the complexity of business life.

What is true regarding business is equally true in relation to the other activities and experiences of life. Many persons will not allow their yesterdays to remain buried. They still live in the past and constantly keep the sorrows and, perhaps, misdeeds of bygone years before them. It was Susan Coolidge, thinking along this line, who wrote:

"Every day is a fresh beginning,
Every day is the world made new;
You who are weary of sorrow and sinning,
Here is a beautiful hope for you,
A hope for me and a hope for you."

To the man and woman whose experiences of yesteryears have been bitter, and still rankle in the memory, reaching out to clutch the heart and cause it pain, to begin afresh each day is a solution of their trouble. What if the years have been wasted, what if they have brought sorrow and distress and bitterness? They are gone, never to return. Blot them out of your memory as if they had never been. Think no more of the past, but greet the dawn of each day as the birth of a new world for you; a world which pain and sorrow has not touched; a world that by your own actions you can make worth living in, for yourself and others.

And don't let the clouds of today reach over and make tomorrow a day of gloom. Perhaps at this very moment things are going wrong with you. Today you have passed through an unpleasant experience. You have been hurt by an acquaintance, knowingly wounded by one whom you have considered your friend, defrauded, perhaps, by one in whom you had implicit trust. Don't let that cause you to be cast down. When you retire and close your eyes, say to yourself "Tomorrow will be a new day; I shall awake upon a world made new."

According to Specifications

IN THE erection of an edifice, the building of a bridge, the construction of a railroad or highway, the first thing to be done before work is thought of, is to prepare the specifications. No architect or builder would ever think of beginning a job until complete plans and specifications had been prepared and approved.

Yet, in the building of character, few people work along any definite lines.

A few years ago, a professor in one of the eastern colleges prepared a set of specifications for the building of character, which he distributed among his young men, and urged them seriously to follow the lines laid down. The following is an abstract. He called them

Specifications for the Building of Character.

Foundations: The four cornerstones are Honesty, Purity, Perserverance and Self-Control. To these should be added such stones as Economy, Industry, Self-Denial, Honor and Firmness, cemented together with Tenacity of Purpose, Courage to Fight to the bitter end for the Right, and the ability to Smile when everything goes wrong.

Superstructure: Upon the foundations thus prepared, the superstructure should be erected. The framework should be of Kindness, Truthfulness, Sincerity of Purpose, Abhorrence of all that is evil, and Love of Work. The Determination to stick to One Thing until it has been Accomplished overcoming all Obstacles, and a Strong Faith in your ability to reach the goal for which you have set out. Over all put a roof of Love to Mankind and Trust in God, which will keep out the storms and winds of adversity, which are bound to assail throughout life.

Decorations: A Smile for every one, Thoughtfulness for others, Pity for the weak, Cheerfulness under all conditions, Readiness to lend a Helping Hand to those who need it, and a Peace of Mind which remains undisturbed whatever may happen.

You who read this can build such a character, if you will to do so. It was Alexander Dumas who said:

"All the world cries, we want a man; do not look so far for this man. You have him at hand. This man—it is you, it is I; it is each one of us; how to constitute oneself such a man? Nothing harder if one knows not how to do it; nothing easier, if one wills it."

If a young man or woman starts out in life with the determination to build character according to specifications as given above, holding rigidly to the rules laid down therein, the resulting moral structure cannot fail to be one of beauty and symmetry.

Don't live your life in a slipshod manner; set your eyes upon a goal and press toward it. Mold your character according to some rule of action, and when the years have completed the building of a noble edifice, the happiness which will result from your work can never be taken away.

Start today, and begin to build, according to specifications.

Rebuild Our Forest Reserves

THE American Forestry Association is performing a public service by persistently calling the attention of this nation to the need for a constructive national forestry policy.

The depletion of our forests is a matter of great concern, the significance of which has as yet been only partially grasped by the public. The high price of lumber and the scarcity of wood pulp for print paper are only indications of the price we will eventually pay if we refuse to heed the warning signals.

The virgin forests of the United States have dwindled to about one-sixth their original size. Another sixty years will see even this remnant wiped out unless immediate and proportionate steps are taken toward a sound scheme of reforestation.

From a political standpoint the restoration of our forests may not be a burning issue. But from an economic standpoint it is most certainly imperative.

Too Cheap

A BROOKLYN undertaker, who sold great quantities of illicit liquor in which the main ingredient was wood alcohol and who thereby became responsible for more than 100 deaths, has been sentenced to from three to seven years at Sing Sing.

Three to seven years at Sing Sing for what amounts to the murder *of more than 100 persons!*

Is Justice in league with the bootleggers?

Mr. Ford's Page

IF YOU take our present social system and set it down as a diagram on paper, as the various reformers do with their social schemes, you will discover a curious thing—you will discover that the present system of society is utterly impossible, it will not work. Yet it does work! As you diagram it, it would seem to contradict itself at every step, it would seem to be the most unbalanced and ill-jointed and incoherent entity that anyone could conceive. Yet here it is, and it answers certain ends.

On the other hand, if you take Bolshevism or any of the other various forms of socialism, and put them upon paper in diagram form, you will apparently have before you the perfect scheme of a perfect society, and you may be easily convinced that it will work. It seems plain that it must work. Thousands of people, viewing the diagram, are thoroughly persuaded that it cannot help but work. Nothing remains to do but start it! Yet, the curious and disillusioning fact is that it does *not* work.

That is one of the strangest discoveries we can make: the utterly impossible thing, goes; the apparently perfect thing, fails. Make a diagram of social and economic life in the United States, and you would be ready to say, "Impossible!" Make a diagram of Bolshevist social theory, and you would probably be ready to say, "How practical, perfect and desirable!" Yet life in the United States goes on securely, while Russia, except to a few grafters, is a nearer approach to hell than was ever witnessed on this planet. Any Bolshevist who has had a full taste of Bolshevism as it is, will tell you so.

So many things are clumsy, stupid and imperfect; and so many offered substitutes are clever, logical and alluring, that it grows to be a wonder why the imperfect thing lasts, and why the apparently perfect thing does not take its place.

The reason seems to be a deep-set instinct of humanity that paper-plans may be all right on paper, but society is an organism, society is a process, a life, a growth, which cannot be laid out on a blueprint, any more than a soul can be diagramed.

There is little chance of an intelligent people running wild with the fundamental processes of economic life. Most men know they cannot get something for nothing. Most men feel, even if they do not know that money is not wealth. The ordinary theories which promise everything to everybody, and demand nothing from anybody, are promptly denied by the instincts of the ordinary man, even when his mind does not form reasons against them. He *knows* that they are wrong, and that is enough.

> ***SET it forth as a diagram on paper, and our social system looks impossible. Yet it works. Take another system long advertised by the reformers and diagram that, and it is the most perfect scheme you ever saw. You are convinced that it could never do anything but work with the most perfect satisfaction. Yet, when it is tried, it does not work at all. Why? Well, faulty as our old system is, it has a fundamental essence which the new systems lack—an element compounded of the economic fundamental known as Labor and the social fundamental known as Morality. Tamper with either, and no society, ancient or modern, capitalist or socialist, organized or anarchic, is at all possible. This lesson the drawers of social diagrams have not learned.***

But that does not dispose of the other fact that the present order, always clumsy, often stupid, and in many ways imperfect, can work along as well as it does. Admitting that it is not a perfect order by any means, it still has this advantage over the others—it works. To be sure, this is a fact in its favor, but it is not a fact which cannot be true of any other order. Doubtless this order will merge by degrees into another, and the new one will work also, not so much by reason of what it is, but by reason of what men will bring into it.

The reason why Bolshevism did not work, and cannot work, is not economic at all. It doesn't matter whether industry is privately managed or socially controlled; it doesn't matter whether you call the workers' share "wages" or "dividends"; it doesn't matter whether you regimentalize the people as to food and clothing or shelter, or whether you allow them to eat what they like, wear what they like and live where they like. These are mere matters of detail. The incapacity of the Bolshevik leaders is indicated by the fuss they made over such details.

No, the reason for Bolshevism's failure is its deliberate ignoring of common morality and human nature. Human nature is addicted to moral revolts, but it never respects a system that depends upon the moral revolt being constant. There are conditions under which every man will steal, but not even the confirmed thief respects the system that drives everyone to thievery. Bolshevism has exacted the greatest sacrifice ever demanded of a people—the sacrifice of their essential morality and the sacrifice of their former freedom. It was a great price, a price worthy of a great return. But there will be no return. Why?

There is no truth and sincerity, therefore there can be no mental or moral strength. These things go together. Bolshevism does not know it. You may change social methods as much as you please; as long as the earth gives her yield, and as long as men are sincere, a satisfactory form of life will be possible. The trouble with perfect social diagrams is that they assume the control of men who are destitute of the moral sense, and who have no conception of the depths and heights of common human nature.

That is the explanation of the operation of our own social system as at present constituted. Wrong?—of course it is wrong, at a thousand points! Clumsy?—of course it is clumsy; reminiscent of the Dark Ages at a hundred points! By all right and reason it ought to break down. Why doesn't it? Because it is instinct with certain economic and moral fundamentals. That is the reason.

The economic fundamental is, of course, labor. Labor is the human element which makes the faithful seasons of the earth useful to men. It is men's labor that makes the harvest what it is. That is the economic fundamental: every one of us is working with material which we did not and could not create, but which was presented to us by nature.

The moral fundamental is, of course, men's rights in their labor. This is variously stated. It is sometimes called "the right of property." It is sometimes masked in the command, "Thou shalt not steal." It is the other man's rights in his property that makes stealing the crime that it is. When a man has earned his bread, he has rights in that bread. If another steals it, he steals more than bread; he makes an invasion of sacred human rights.

Now, there is just enough of the presence of these two fundamentals to enable society to continue after a fashion and to yield the fruits of life to an increasing number of people. The majority of people work. Of course there are some who do not, but they have been so small a minority that they do not affect the whole. Property rights are acknowledged to a large extent. Not to the full, perhaps, but sufficiently to keep the social scheme intact and working.

"Not to the full," has just been said, but surely nearer the full than to total denial of rights. The scale will show that progress has been made more than half way, at the very least; yes, very much more than half way; and, what is better, moving toward the "full" all the time. You know, all there is to divide is what we altogether create. What we together create is distributed, that is, pretty well divided already; if it were not there would be no commerce. The contention seems to be as to whether the rewards have been divided. And regardless of differing attitudes as to this, the fact remains that here too the scale is rising toward the "full."

So that is what keeps our society afloat. Clumsy as it seems when put on paper, it has that saving essence within it—an essence compounded of industry and morality. You cannot build society without morality any more than you can build a span of broken planks. Indeed, what represents tensile strength in the social world is just this thing we call morality—no society is stronger than its moral conceptions, and when you seek the caliber of a society's moral conceptions you look at the security of the rights of property among them—the rights of the individual in himself and in the products of his labor.

America Brings New Foods From Many Lands

By AARON HARDY ULM

"WHY so many cultivated plants?" we wonder as we turn the alluring pages of a seedman's or nurseryman's catalog. Then we select for our gardens or orchards a few of the stand-bys our parents or grandfathers used to grow and consider ourselves very enterprising.

Despite the multitude of edible articles that come from our soil and are displayed in our markets, the constant wail of the housewife is, "Oh, for something new to cook!"

The United States Government is constantly beseeching farmers and gardeners and fruit-growers to try out new things in food plants. The worth of many of them has been proved by long experiments and if they were grown as freely as they might be the housewife's problem of variety for the table would be much lightened.

During the past twenty-five years there have been brought into the United States, under government auspices, nearly 50,000 varieties of foreign seeds and plants for test with the view of Americanization. And yet the possibilities afforded by the plant life of other countries have scarcely been skimmed by our investigators. Government plant explorers are today wandering through fields and forests of several foreign lands looking for new specimens that offer promise. Missionaries and diplomats, consular and naval officers, as well as private travelers help to procure new specimens, some of which have revolutionized agriculture in big areas of the country. Few subjects are being given more aggressive attention, for the constructive thought of the world was never before so concentrated on making the daily ration of human beings more secure, cheaper and more healthful.

The quest leads along many routes of science and economy, for it involves equations that until recent years were unknown and others that are yet but partly divined.

When the caloric theory of foods was established, we learned that many rare viands—porterhouse steak, for example—were of less essential worth than some very common dishes, beans, for instance.

Then it was found that calories are not all; for the little known vitamines and the mineral salts are of just as much importance in sustaining life and health as are heat units.

Heightening the efficiency of plants is the purpose of the plant explorer and plant breeder, and in pursuit thereof they are scouring all the continents and wearying through periods of decades with experiments in development and adaptation.

For there are thousands of acres in this and other countries that are not doing their best for mankind, and in many instances nothing at all, for the reason that the plant life growing upon them is not the most suitable for their soils and climates.

The task of finding or evolving the right plants for every acre of available soil and for our dietary needs is a world undertaking of the most romantic nature.

For Americans, the work is carried on in great part, though by no means wholly, by or under the auspices of the government.

In Washington there is a clearing house for plant immigrants. It is known as the Office of Foreign Seed and Plant Introduction, a branch of the Bureau of Plant Industry, United States Department of Agriculture. Arriving there monthly are about one thousand would-be Americans from all parts of the globe. After being classified they are sent to a station in Maryland that acts as the Ellis Island of plant immigrants. There, in sealed rooms of cement, they are subjected to careful physical examinations to determine if they are diseased; for against plant diseases there is a stricter quarantine than against the human.

If they pass the physical examination, the immigrants are sent to field stations, of which there are five, and subjected to growing tests. If those tests indicate that they are desirable additions to our plant life, specimens are distributed among plant breeders for practical propagation; and the fruitings are passed along to consumers for test or popularization as food.

Many do not pass all the tests of Americanization; then many do, with resulting additions to farming opportunities and to the cheapness or variety of American grown products.

Thus came the date palm from the valley of the Euphrates. Thousands of them are beginning to bear in the Coahuila and Imperial valleys, California, and in a few years American dates, superior to the imported, will be available throughout the country.

Thus came also Pima cotton, a long staple variety, evolved from Egyptian strains, and now luring millions of wealth from southwestern lands that twenty years ago were desert.

In large part the Smyrna fig, now thoroughly domesticated, came in that way, though George C. Roeding, a private individual, is conceded chief credit for its introduction.

Thus came the dasheen, the first carload of which reached New York the other day and helped relieve the potato shortage.

Thus came durum wheat, which is now being grown to the extent of $50,000,000 worth annually on lands not well suited to the older wheat varieties, which haven't as high dietary value.

And thus have come numerous other things with names that to average American ears sound strange, as in appearance they are to average American eyes—like the petsai, or Chinese cabbage; the udo and the mitsuba, vegetables that are as common in Japan as celery and asparagus are with us; and the chayote, a squash-like vegetable from Central America that grows on handsome perennial vines.

Undergoing experiment are scores of others, like a blackberry vine from Columbia that bears fruits the size of pullets' eggs; fruit trees just received from Africa that are unknown even to the written botanies; bamboos that send up shoots that sometimes grow as fast as three feet a day and to the Chinese are a food of unexcelled popularity; persimmons that in their native Orient grow as big as grape fruit; jujubes, the fruit of which when processed is as good as Persian dates, and the pistache nut tree from Greece.

And for the animals which we must also feed, they have brought in Rhodes and Sudan grass from Africa; the speckboom, a favorite food of African elephants; the Kudsu, a new grass from Japan, and various other forage plants that in many areas fare better than our native species.

A date palm orchard in Southern California, where date culture developed from specimens brought from Arabia and Egypt is now an established industry.

To get such things, wandering scientists have searched out-of-the-way places in many lands. One, Frank N. Meyer, traveled 8,000 miles through China, Siberia, Russian Turkestan, Korea and Tibet. David Fairchild, who directs the work, and Barbour Lathrop, a private citizen who suggested its establishment on the present basis, spent three years, at Mr. Lathrop's expense, touring the globe in search for new plants which the government might help to propagate. Other men have been through Russia, and in Africa, where two now are, and in Central and South America, which are now being searched again.

The plant explorer's adventures are numerous, for he cannot follow the beaten tracks of travel. Frequently he is suspected by superstitious natives, often in sections never before visited by white men. Meyer was once lined up to be slain but talked his way out. He finally lost his life in line of duty. While hemmed up in interior China, his health broke down and when getting out he disappeared from a Yangste river boat and was drowned.

Sometimes great diplomacy and ingenuity must be used in procuring samples of plants. Some people still hug the delusion, it seems, that they can conserve their own selfish interests by restricting the distribution of some plant that is valuable to them. Four or five centuries ago the Dutch, who then controlled the East Indian trade, tried such tactics with the pepper plant, whose growing they limited, even to the extent of cutting down one-half the trees in territories they controlled. The exorbitant increase in prices that resulted caused London merchants to enter into a co-operative trading arrangement that led to the development of the great East India Company, with all that it meant to the British Empire.

While we seek to get from others whatever we desire, we also freely give to other peoples anything of ours which they may need. In fact, the United States Office of Foreign Seed and Plant Introduction is a world as well as a domestic clearing house, through which exchanges are made with other governments and with botanists and plant breeders throughout the world.

"The giving of a new food plant does not rob the giver, but enriches instead the neighbor and makes him a better purchaser,' says Dr. Fairchild.

Many of our distinctive plants are being or have been established in other lands, to the great benefit or enjoyment of their peoples. They point out to you in Washington City, for example, long rows of flowering Japanese cherries, sent to us by the Mayor of Tokio, who in turn points out with equal pride long rows of American dogwood, sent him in return.

While plant distribution has been under way veritably since the beginning of time, and virtually all of our cultivated plants are of immigrant origin, the standardization of the process has disclosed the fact that it is far, far from complete. In other lands there grow hundreds of plants that may yet prove valuable additions to our farms, and vice versa we have many that other peoples need.

"The food producing possibilities of Mother Earth have only been scratched," says Dr. Fairchild, "for we have only just begun to study in a modern way the performances of different plants.

"Can anyone tell why cassava will never compete with corn as a food or why the avocado should not rival the orange as a table delicacy, or why Oriental persimmons should not be eaten fresh or dried by millions in the South or why the prickly pear, which will keep a year without spoiling, should not become an important article of commerce?

"The tomato, as you know, was scorned as a poisonous nuisance until about a half century ago. The grape fruit was almost unknown as a food until a quarter of a century ago. Our farmers knew nothing of the sorghums, those invaluable immigrants from Africa, until within the last forty or fifty years."

In South America you hear as a common saying that no meal is complete without the avocado. It is one of the few fruits that, like the date, is of high caloric worth, being 30 per cent vegetable oil. A practically complete meal can be made on avocado alone.

In Central America a hatful can be bought for a dime; in a few years, I am assured, Southern Florida will be producing them in such quantities that they will be as cheap in America as grape fruit.

And there are other fruit-foods that promise quite or nearly as well, such as the mango, superlative tree fruit, now, like the avocado, being developed on wide scale in our sub-tropics.

The jujube, from China, will grow in more northerly areas, and prefers those of alkaline and drouth where few of our native fruits will prosper. It is expected to establish fruit culture in wide districts that now have virtually none.

The Oriental persimmon, aristocratic kinsman of our own lowly but by no means to be scorned native species, will grow freely in many sections of the United States.

Introduction of new fruits is not always handicapped by that most reactionary of our five senses—taste. A good fruit is almost universally liked; not so with good vegetables.

"I don't like it," or "My family won't eat it," or "I'd rather cook what I am used to," are the reactionarisms that are perhaps the greatest obstacles to the introduction of foods that are absolutely new no matter how potentially valuable they may be.

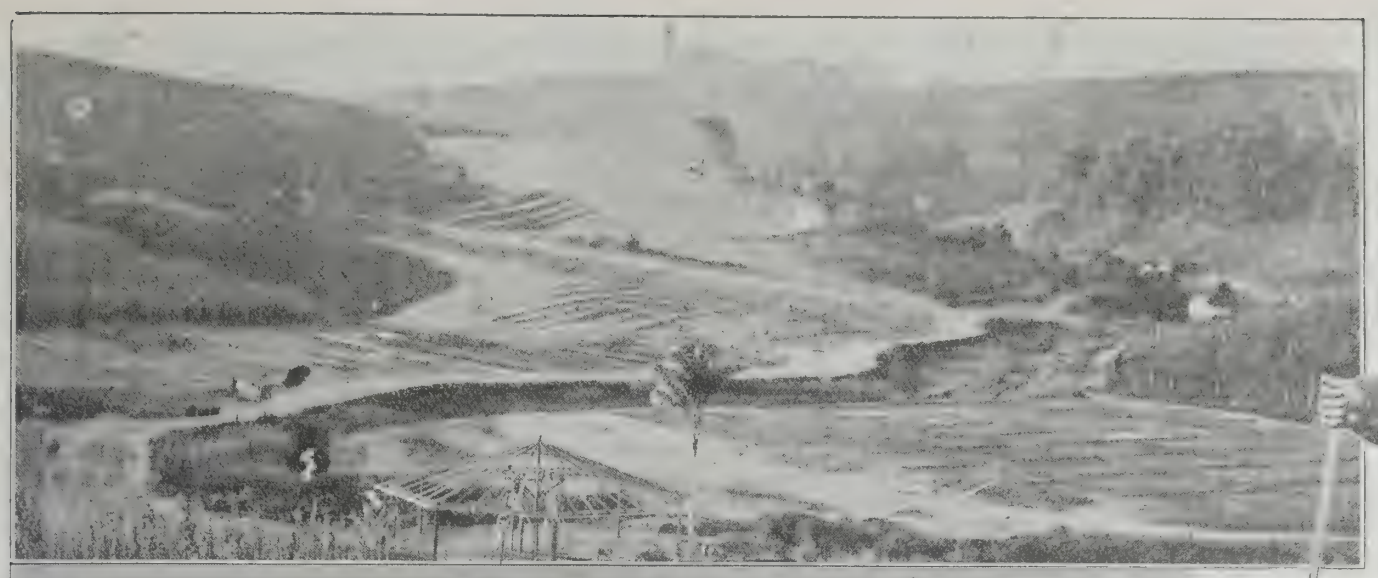
Only two species of animals, I am informed, have the nerve and wisdom to try out anything in the way of new food. They are the cat and the rabbit. Stefansson's dogs that were accustomed to eating seal meat went without food for days before they would touch caribou, and others used to caribou almost starved before they would eat seal meat.

Human beings are as perverse. Thousands of half-starved Europeans refused absolutely to eat bread made of our corn meal until it was camouflaged with other materials.

Psychologists and physiologists say that idiosyncrasies of taste should never be encouraged in children; that they should be given only what they ought to have, so that later in life they won't be haunted by absurd "I-don't-like-its."

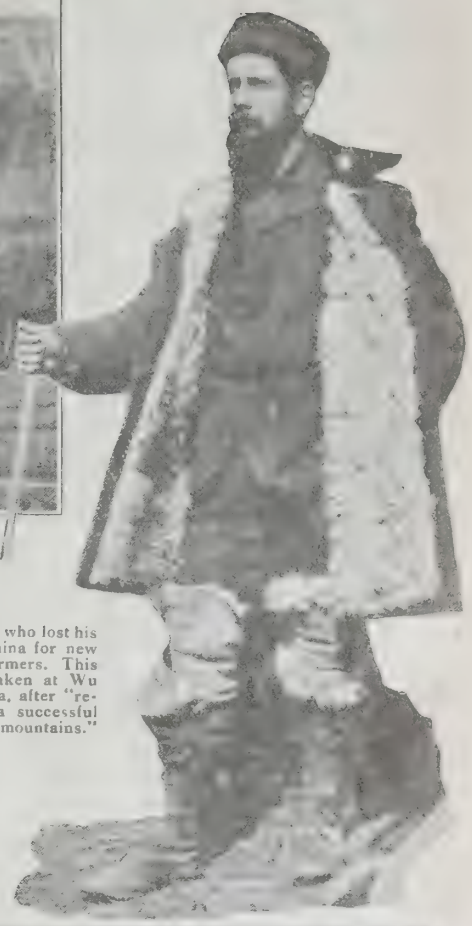
Plant explorers, who by forced experience as well as design learn the value of all foods, say that we should go that principle one better. While supporting schools for training children to best use their eyes, hands and ears, we should also train them to make best possible use of their senses of smell and taste.

"Though change, by necessity, is slow," says Dr. Fairchild, "it is ever under way. It is our duty to facilitate and guide it along the lines of greatest dietary and economic advantages. We'll not always eat the foods we do now. Some are very costly, considering their integral worth, some are not easily digested, and many can be displaced by others that may be grown more cheaply and are of higher dietary worth.



"It won't be long before we shall have a population of a half billion people in this country, and the trend of economics is steadily changing adversely to food production, the ratio between rural and urban workers rapidly favoring the latter. Never before was it so important for us to find ways for making every growing acre do its best.

"It is demonstrably easier to find new crops for different soils and climates than to change those soils and climates. There are more available food crops than the average person imagines exist in the world.



"It is the business of the plant explorer and breeder to find and adapt them when possible, even in advance of crying need for them.

"Anybody who is doubtful of the future food supply will be reassured by listening to any one of the enthusiasts in the Department of Agriculture, who will tell you that our food reservoir is by no means limited to the Great Plains area.

"One of the first great objects of the work of plant introduction is to get the farmers of the country to realize that there are many more kinds of farming than they dreamed possible, that new kinds are coming into existence all the time and that there is no reason why the kinds should not be rapidly increased.

An agricultural station in Brazil, from which country a missionary sent to America the sprigs that became the ancestors of our navel orange.

FRANK N. MEYER, who lost his life while exploring China for new plants needed by our farmers. This picture was taken at Wu Tai Shan, China, after "returning from a successful raid in the high mountains."

Brought From Afar to Tickle Your Palate

Directly below—An irrigated Chinese garden devoted to growing petsai, or what is frequently called in this country "celery cabbage," as easily grown and as a table food much superior to the common cabbage

Below circle—The dasheen, growing in Southern Georgia, where and in other sections of the South the West Indian immigrant introduced it.

Above—A radish, grown from seed brought from China.
Below—In this mountain region of China a government plant explorer found the wild peach, promising much to regions too cold or dry for peaches and apricot trees.

At the right—Udo shoots, one of the most popular of Japanese vegetables introduced by the government into this country, grown by D. N. Shoemaker, at Tacoma Park, near Washington.

Below—A cart load of Gustemalan avocados, a fruit of extraordinary high food value which experts say may some day rival the potato as a staple world food. Their growth is now taking firm root in Florida.

D'Israeli—British Premier, Portrays the Jews

Warning Against Involving Freemasonry; the Revelations in "Coningsby" Confirm Views of "International Jew"

THE Jews have complained that they are being misrepresented. It is their usual complaint. They are always being "misrepresented" and "persecuted" except when they are being praised for what they are not. If the Jews were fully understood by the Gentiles, if the Christian churches, for example, were freed from their delusion that the Jews are Old Testament people, and if the churches really knew what Talmudic religion is, it is likely the "misrepresentation" would be still stronger.

The downfall of Russia was prepared by a long and deliberate program of misrepresentation of the Russian people, through the Jewish world press and Jewish diplomatic service. The name of Poland has been drawn in filth through the press of the United States under Jewish instigation, most of the signers of the latest Jewish protest against THE DEARBORN INDEPENDENT'S articles being leaders in the villification of Poland, whose sole crime is that she wishes to save herself from the Jews. All this real misrepresentation is regarded as the Jews' privilege.

But wherever a hand has been raised to prevent the Jews overrunning the people and secretly securing control of the major instruments of life, the Jews have raised the cry of "misrepresentation." They never meet the question outright. They are not meeting it now. They cannot meet it without confession. False denials, pleas for sympathy, and an unworthy attempt to link others with them in their fall, constitute their whole method of defense.

Freemasons may wonder how they come into this affair, as they see the name of their ancient order coupled with that of the Jews in the latest Jewish defense. It is all very easily understood by those who are acquainted with Jewish strategy during the two centuries which comprise modern Masonic history.

Twice in the history of the United States, the people have been aroused by a sense of strange influences operating in their affairs, and each time the real power behind the influences was able to divert suspicion *to* the Freemasons. Once in George Washington's time, once in President Adams' time this occurred. Books were written, sermons preached, newspapers took up the search, but none of the observers saw the Jewish influence there. George Washington knew that the disloyal influence was not Masonic, but he saw signs of the concealed power trying to operate under the guise of Masonry. President Adams had not so clear a view of the matter.

Masonry Unscrupulously Dragged in

MASONRY emerged unstained because it was guiltless of subversive purposes. A pseudo-Masonry, of French origin, given to atheistic and revolutionary purposes, strongly patronized by Jews, was the disturbing element, but all that the public was able to see was the Masonic similitude and not the Jewish hand. A recrudescence of this misrepresentation of the Masons occurred also in 1826, and from then until the other day, when the Leaders of American Jewry linked the name of Freemasonry with their own, the name of the Order has been unscathed.

This is to serve notice on the leaders of American Jewry that this time they will not be permitted to hide behind the name of Masonry, nor will they be permitted to hold up the name of Masonry as a shield to blunt the darts or as an ally to share the shafts aimed at their subversive purposes. That game has succeeded twice in the United States; it will never succeed again. Freemasonry is not and never was implicated in what the Jewish cabal has had in mind. And Freemasons everywhere are aware of the facts.

It is a curious fact that just as the Jews have sought to operate through the Masons and then leave that Order to take the brunt of the ensuing assault, so also have they at times sought to operate through the Jesuits, playing the same trick with that name and Order. If the Jesuits and the Masons would compare notes, they could both report the same thing. Jews have sought to use both, and have been frustrated, although in consequence the names of both Orders have suffered for a time.

This is one of the coincidences between the Protocols and the facts: the Protocols express themselves as against both the Masons and the Jesuits, but willing to use both to attain Jewish purposes.

Both these orders are well able to take care of themselves, once they know the key to the Jewish plan. But there is much information on these matters of which the public is not aware, and at a future date a study may be made of the historical efforts of the Jews to use and destroy Freemasonry. Such a study will be useful in showing how Jewish influence operated in a day when the people had no means of identifying it as Jewish. The people attacked the thing they saw, but what they saw was not the source of the element they opposed. Progress has been made at least to this extent, that nowadays, more than at any previous time, the world plan of the Jews is known and recognizable.

The main purpose of the present article, however, is to show the reader that the Jews have not been misrepresented, the means of showing this being a presentation of the Jews by a notable Jew whom the Jews are delighted to honor.

Benjamin D'Israeli, who was Earl of Beaconsfield and prime minister of Great Britain, was a Jew and gloried in it. He wrote many books, in a number of which he discussed his people in an effort to set them in a proper light. The British Government was not then so Jewish as it has since become, and D'Israeli was easily one of the greatest figures in it.

D'Israeli Calls Jews "Mosaic Arabs"

IN HIS book, "Coningsby," there appears a Jewish character named Sidonia, in whose personality and through whose utterances, D'Israeli sought to present the Jew as he would like the world to see him.

Sidonia first announces his race to young Coningsby by saying, "I am of that faith that the Apostles professed before they followed their Master," the only place in the whole book where the "faith" is mentioned. Four times, however, in the brief preface to the fifth edition, written in 1849, the term "race" is used in reference to the Jews.

In the first conversation between these two, Sidonia reveals himself as a great lover of power, and discourses charmingly of the powerful men of history, ending in this way:

"Acquaviva was General of the Jesuits, ruled every cabinet in Europe and colonized America before he was thirty-seven. What a career!" exclaimed the stranger (Sidonia), rising from his chair and walking up and down the room; *"the secret sway of Europe!"* (p. 120. The references are to Longman's edition published in 1919. The italics are ours.)

Taking up a study of the character of Sidonia the Jew, D'Israeli the Jew begins to refer to the Jews as *"Mosaic Arabs."* If a modern writer were to describe the Jews thus, virtually as Arabs of the Mosaic persuasion, it would be denounced as another attempt at "persecution," but D'Israeli did this a number of times, his purpose evidently being to give the Jew his proper setting as to his original position among the nations. Again he refers to them as *"Jewish Arabs."* Both of these terms may be found on page 209.

D'Israeli also gives voice to the feeling, which every Jew has, that whoever opposes the Jew is doomed. This is a feeling which is strongly entrenched in Christians also, that somehow the Jews are the "chosen people" and that it is dangerous to oppose them in anything. "The fear of the Jews" is a very real element in life. It is just as real among the Jews as among non-Jews. The Jew himself is bound in fear to his people, and he exercises the fear of the curse throughout the sphere of religion—"I will curse them that curse thee." It remains to be proved, however, that opposition to the destructive tendencies of Jewish influences along all the principal avenues of life is a "cursing" of the Jews. If the Jews were really Old Testament people, if they were really conscious of a "mission" for the blessing of all the nations, the very things in which they offend would automatically disappear. If the Jew is being "attacked," it is not because he is a Jew, but because he is the source and life of certain tendencies and influences, which, if they are not checked, mean the destruction of a moral society.

The persecution of the Jew to which D'Israeli refers is that of the Spanish Inquisition, which rested on religious grounds. Tracing the Sidonia family through a troubled period of European history, our Jewish author notes:

"Wars Are the Jews' Harvests"

"DURING the disorders of the Peninsular War.... a cadet of the younger branch of this family *made a large fortune by military contracts,* and supplying the commissariat of the *different armies.*" (p. 212) Certainly. It is a truth unassailable, applicable to any period of the Christian Era, that "persecuted" or not, "wars have been the Jews' harvests." They were the first military commissaries. If this young Sidonia in supplying "the different armies" went so far as to supply the opposing armies, he would be following quite perfectly the Jewish method as history records it.

"And at the peace, prescient of the great financial future of Europe, confident in the fertility of his own genius, in his original views of fiscal subjects, and his knowledge of natural resources, this Sidonia .... resolved to emigrate to England, with which he had, in the course of years, formed considerable commercial connections. He arrived here after the peace of Paris, with his large capital. He stakes all that he was worth on the Waterloo loan; and the event made him one of the greatest capitalists in Europe."

"No sooner was Sidonia established in England than he professed Judaism ...."

Sidonia had foreseen in Spain that, after the exhaustion of a war of twenty-five years, Europe must require capital to carry on peace. He reaped the due reward of his sagacity. Europe did require money and Sidonia was ready to lend it to Europe. France wanted some; Austria more; Prussia a little; Russia a few millions. Sidonia could furnish them all. The only country which he avoided was Spain ...." (p. 213)

Here the prime minister of Great Britain, from the wealth of his traditions as a Jew and the height of his observation as prime minister, describes the method of the Jew in peace and war, exactly as others have tried to describe it. He puts forward the same set of facts as others put forth, but he does it apparently for the Jews' glorification, while others do it to enable the people to see what goes on behind the scenes in war and peace. Sidonia was ready to lend money to the nations. But where did he get it, in order to lend it? He got it from the nations when they were at war! It was the same money; the financiers of war and the financiers of peace are the same, and they are The International Jews, as Benjamin D'Israeli's book for the glorification of Jewry amply testifies. Indeed, he testifies on the same page just quoted:

"It is not difficult to conceive that, after having pursued the career we have intimated for about ten years, Sidonia had become one of the most considerable personages in Europe. *He had established a brother, or a near relative, in whom he could confide, in most of the principal capitals. He was lord and master of the money market of the world, and of course virtually lord and master of everything else.*"

This comes as near being The International Jew as anything can be, but the Jews glory in the picture. It is only when a non-Jewish writer suggests that perhaps it is not good for society that a Jewish coterié should be "lord and master of the money market of the world," and as a consequence "lord and master of everything else," that the cry of "persecution" arises.

International Jews and Their Web

STRANGELY enough, it is in this book of the British premier that we come upon his recognition of the fact that Jews had infiltrated into the Jesuits' order.

"Young Sidonia was fortunate in the tutor whom his father had procured for him, and who devoted to his charge all the resources of his trained intellect and vast and various erudition. *A Jesuit before the revolution; since then an exiled Liberal leader; now a member of the Spanish Cortes; Rebello was always a Jew.* He found in his pupil that precocity of intellectual development which is characteristic of the *Arabian* organization." (p. 214)

Then followed in young Sidonia's career an intellectual mastery of the world. He traveled everywhere, sounded the secrets of everything, and returned with the world in his vest pocket, so to speak—a man without illusions of any sort.

"There was not an *adventurer* in Europe with whom he was not familiar. No minister of state had such communication with *secret agents and political spies* as Sidonia. He held relations with all *the clever outcasts* of the world. The catalog of his acquaintances in the shape of Greeks, Armenians, Moors, *secret Jews,* Tartars, Gypsies, wandering Poles and Carbonari, would throw a curious light on *those subterranean agencies of which the world in general knows so little,* but which exercise so great an influence on public events. .... *The secret history of the world* was his pastime. His great pleasure was *to contrast the hidden motive, with the public pretext,* of transactions." (pp. 218-219)

Here is The International Jew, full dress; he is the Protocolist too, wrapped in mystery, a man whose

fingers sweep all the strings of human motive, and who controls the chief of the brutal forces—Money. If a non-Jew had limned a Sidonia, so truthfully showing the racial history and characteristics of the Jews, he would have been subjected to that pressure which the Jews apply to every truth-teller about themselves. But D'Israeli could do it and one sometimes wonders if D'Israeli was not, after all, writing more than a romance, writing indeed a warning for all who can read.

The quotation just given is not the description of Sidonia only; it is also a description—save for the high culture of it—of certain American Jews who, while they walk in the upper circles, have commerce with the "adventurers" and with "the secret agents and political spies," and with the *"secret Jews,"* and with those "subterranean agencies of which the world in general knows so little."

Sidonia, "The Perfect Jew," Begins His Talk

THIS is the strength of Jewry, this commerce between the high and the low, for the Jew knows nothing disreputable within the circle of Jewishness. No Jew becomes an outcast, whatever he may do; a place and a work await him, whatever his character.

There are highly placed persons in New York who would rather not have it known what they contributed to the "adventurer" who left New York to overturn Russia; there are other Jews who would rather not have it printed how much they know of "secret agents and political spies." D'Israeli did more than draw Sidonia; he portrayed The International Jew as he is found also in America.

Thus far Sidonia is described from the outside. But now he begins to speak for himself, and it is in behalf and praise of the Jews. He is discussing the discrimination practiced against his people in England. It is the old story. Everywhere, even in the United States, the same story. Crying for pity while usurping power! "We poor Jews" wails a New York multi-millionaire at whose finger legislatures quail and even Presidents of the United States grow respectful.

The following quotation was written in 1844: Britons must be impressed with its uncanny parallel to their affairs today: it is Sidonia speaking—

". . . . yet, since your society has become agitated in England, and powerful combinations menace your institutions, you find *the once loyal Hebrew invariably arrayed in the same ranks as the leveller and latitudinarian,* and *prepared to support the policy which may even endanger his life and property,* rather tamely continue under a system which seeks to degrade him."

Consider that. "Latitudinarianism" is the doctrine of the Protocols in a word. It is a break-up by means of a welter of so-called "liberal" *ideas* which construct nothing themselves, but have power to destroy the established order.

Note also D'Israeli's answer to the question sometimes asked, "If the Jews suffer under Bolshevism, why do they support it?" or the Jewish spokesmen's form of it—"If we are so powerful, why do we suffer in the disorder of the world?" The disorder is always a step to a new degree of Jewish power: Jews suffer willingly for that. But even so, they do not suffer as the non-Jews do. The Soviets permit relief to enter Russia for the Jews. In Poland, the "starving war-sufferers" are able to glut all available ships in taking high-priced passage to America. They are not suffering as other people are, but, as D'Israeli sees, they are willing to suffer because they see in every breakdown of Gentile society a new opportunity for the Jewish power to dig nearer the central seat of power.

Just how the Jew works to break down the established order of things, by means of *ideas,* as the Protocols claim, is shown in this same conversation of Sidonia:

"The Tories lose an important election at a critical moment; 'tis the Jews come forward to vote against them. The Church is alarmed at the scheme of a latitudinarian university, and learns with relief that funds are not forthcoming for its establishment; a Jew immediately advances and endows it."

If these words had been written by a non-Jew, the cry of anti-Semitism would ring through the land. They are true, neither more nor less true, because written by a Jew. And Sidonia adds:

"And *every generation they must become more powerful and more dangerous* to the society that is hostile to them." (These quotations from page 249)

Well, several generations have passed since these words were written. The Jew still regards every form of non-Jewish society as hostile to him. He organizes strongly against society. And, if D'Israeli is to be taken as a prophet, his words remain—"they must become more powerful and more dangerous." They have become more powerful. Whoso would measure the danger, look around.

Let the charming Sidonia proceed with his revelations:

"I told you just now that I was going up to town tomorrow, because I always made it a rule to interpose when affairs of state were on the carpet. Otherwise I never interfere. I hear of peace and war in newspapers, but I am never alarmed, *except when I am informed that the Sovereigns want treasure; then I know that monarchs are serious.*"

It will be remembered that Sidonia held no governmental position. The time had not come for that. Power was exercised behind the scenes long before the craving for the spotlight was gratified. But whether there be Jews in office or not, the power they exercise behind the scenes is always greater than the power they show in the open. It can be seen, therefore, that the more numerous they are in office, the greater their secret power. Sidonia continues:

The Jew Behind the Throne

"A FEW years back we were applied to by Russia. Now there has been no friendship between the Court of St. Petersburg and my family. It has Dutch connections which have generally supplied it; and our representations in favor of the Polish Hebrew, a numerous race, but the most suffering and degraded of all the tribes, have not been very agreeable to the Czar. However, circumstances drew to an approximation between the Romanoffs and the Sidonias. I resolved to go myself to St. Petersburg. I had, on my arrival, an interview with *the Russian Minister of Finance, Count Cancrin; I beheld the son of a Lithuanian Jew.*

"The loan was connected with the affairs of Spain; I resolved on repairing to Spain from Russia. I traveled without intermission. I had an audience immediately on my arrival with *the Spanish Minister, Señor Mendizabel; I beheld one like myself, the son of a Nuevo Christiano, a Jew of Aragon.*

"In consequence of what transpired at Madrid, I went straight to Paris to consult *the President of the French Council; I beheld the son of a French Jew,* a hero, an imperial marshal . . . ."

If Sidonia were traveling today he would find whole groups of Jews, where, in his day, he found one, and he would find them in exalted places. Suppose D'Israeli were alive today and should revise "Coningsby," including the United States in the tour of this money-master of the world! What a host of Jewish names he could gather from official circles in Washington and New York—such a host, indeed, as makes the occasional Gentile look like a foreigner who had been graciously permitted to come in by the Jews!

"The consequence of our consultations was, that some northern power should be applied to in a friendly and mediative capacity. We fixed on Prussia; and the President of the Council made an application to the *Prussian Minister, who attended a few days after our conference. Count Arnim entered the cabinet, and I beheld a Prussian Jew.*"

Sidonia's comment upon all this is offered as an address to every reader of this article:

"So, you see, my dear Coningsby, that *the world is governed by very different personages from what is imagined by those who are not behind the scenes.*" (pp. 251-252)

It is indeed! Why not let the world see behind the scenes for a little?

The Jew Behind the Revolution

AND now for the most illuminating lines D'Israeli ever wrote—lines which half compel the thought that maybe, after all, he was writing to warn the world of Jewish ambition for power:

> "You never observe a great intellectual movement in Europe in which the Jews do not greatly participate. *The first Jesuits were Jews. That mysterious Russian Diplomacy* which so alarms Western Europe *is organized and principally carried on by Jews. That mighty revolution which is at this moment preparing in Germany,* and which will be, in fact, a second and greater Reformation, and of which so little is yet known in England, *is entirely developing under the auspices of Jews.*" (p. 250)

American Jews say that the Protocols are inventions. Is Benjamin D'Israeli an invention? Was this Jewish Prime Minister of Great Britain misrepresenting his people? Are not his portrayals taken as true history? And what does he say?

He shows that in Russia, the very country where the Jews complained they were least free, the Jews were in control.

He shows that the Jews know the technique of revolution, foretelling in his book the revolution that later broke out in Germany. How did he foreknow it? Because that revolution was developing under the auspices of Jews, and, though it was then true that "so little is yet known in England," D'Israeli the Jew knew it, and knew it to be Jewish in origin and development and purpose.

One point is sure: *D'Israeli told the truth.* He presented his people before the world with correctness. He limns Jewish power, Jewish purpose and Jewish method with a certainty of touch that betokens more than knowledge—he shows racial sympathy and understanding. He sets forth the facts which this series is setting forth. Why did he do it? Was it boastfulness, that dangerous spirit in which the Jew gives up most of his secrets? Or was it conscience, impelling him to tell the world of Judah's designs?

No matter; he told the truth. He is one man who told the truth without being accused of "misrepresenting" the Jews.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Leo Keena, former American Consul General in Switzerland, but now American representative at Warsaw, was referred to in this department of December 4, as a Jew. The statement was erroneous. Mr. Keena is a good Irishman. A Jewish correspondent writes: "The Jewish blood of Leo Keena must have come from my nosebleed when I wrestled with him in our hayloft on Madison avenue (Detroit) some thirty years ago." It is a testimony to the extent of Mr. Keena's reputation, a testimony also to the care with which THE DEARBORN INDEPENDENT is read, that corrections have come from several parts of the country. The error was due in large part to the matter and tone of a Warsaw dispatch which appeared in the Jewish press.

Rabbi Philip A. Langh says: "It is not for the first time in history, that the Jew dwells in a land like Soviet Russia," and then he describes conditions in the sixth century in Persia. There was a Jewish revolution under the Prince of the Exile. Nationalization of women (Gentiles, of course) was one of the accompaniments of the disorders.

The representative of the United States in the Aland Island dispute is Abram I. Elkus. And again no one appears to know why.

Upon Mr. Elkus' arrival in Sweden, he was met by the American Minister, who also is a Jew—Ira Nelson Morris.

Here is the recipe for revolutions: "Want and opinion are the two agents which make all men act. Cause the want, govern opinions, and you will overturn all the existing systems, however well constituted they may appear."

"Exclude the barterers and the lazy, for these are the classes that mostly make for radicalism," says Commissioner Wallis, of the Immigration Bureau. He says that 15,000,000 people are waiting to come to America. Last week over 30,000 arrived in New York. Most of them were Jews, as these are about the only people who can travel these days.

It is known that South America is now one of the objectives of International Jewry, two indications having pointed it out: First, the movement of gold in that direction; second, the movement of immigrants. It is now reported by Jewish sources that the government of Brazil has "invited" 2,500 Jewish families to that country.

The Jews of Shanghai, China, recently dedicated a white marble synagogue.

The revolution in Russia is Jewish, and the counter-revolution is Russian. That is proved by two things: first, the boast of the Jewish press that it was because of General Wrangel's "anti-Semitism" that the Allies withdrew support from him at the critical moment; second, the call sent out by Russians, and also printed in the Jewish press—"Russians, come and save Russia from the Jews! I go to the aid of my brother Wrangel, whose army is a Russian and not a Jewish one." The amazing effrontery of responsible Jews in the United States, in denying that Bolshevism is Jewish, very vividly indicates the length they think they can go in bludgeoning American intelligence.

An American book about the Jews, published in 1888, contains this preface: "We expect the Jews will try to boycott 'The American Jew' . . . . They will appoint committees to visit book dealers urging them not to handle the book; they will buy up and destroy all copies found exposed for sale; they will bribe, threaten, plead, and try in every way to interfere with its sale; they will circulate reports that the book has been 'called in.'" A recent report on a book that was wanted reads this way: "Whenever a copy turns up, it is immediately bought by a Jew." The scarcity of the United States Senate document containing the Morgenthau Report is accounted for in the same way.

Poland, which is so insistently reported to be "persecuting" the Jews, has appointed a Jewish envoy to Vienna.

Your Own United States—A Famous Old Fort

Erected as a defense against the Indians during Pontiac's war in 1764, by Colonel Henry Boquet. This quaint five-sided blockhouse remains in an excellent state of preservation, and is the only landmark of the British occupation of the Forks of the Ohio. It stands on the site of Fort Pitt, which is Pittsburgh of today. The local chapter of the Daughters of the American Revolution acts as custodian of this historic place which is Pittsburgh's oldest building.

The Problem of Asthma

ONE of the commonest causes of suffering is asthma. It is safe to say that death can never be directly attributed to it, and yet for incapacitating distress of a persistent, terrifying character it has few equals. Its occurrence is widespread even among people of apparently good general health. The medical profession has found it a most puzzling problem for more than passing relief. There has been a capriciousness about the affection which was paradoxical. What caused the attack in one served to relieve it in another. But for permanent relief there has existed a despairing hopelessness in the face of which any light which will kindle new hope in the hearts of sufferers from asthma should receive attention.

In the September 25th issue of THE DEARBORN INDEPENDENT, these remarkable statements were quoted from an English magazine:

"Serum remedies for asthma contain such substances as cat's fur, goose feathers, dog's hair, horse's mane, fish, onions, or other ingredients, according to the specific cause of the patient's asthma. Some cases are caused by inhalation of horse odor and dandruff; hence, the inclusion of the offending substance in the curative serum."

The quotation suggests the formula of a Chinese herb dealer, and yet in its brevity it is accurate, as you will see.

The term asthma, derived from the Greek verb "to breathe," is applied in medicine to laborious breathing. True asthma, or more technically true bronchial asthma, is a particular type of laborious breathing, independent of the common causes of shortness of breath, namely, heart or circulatory troubles, lung affections, Bright's disease, or anemia. These latter types are very different, and can be eliminated in most instances of true asthma.

The association of hay fever with asthma is more or less that of junior and senior. Many who have endured for years the seasonal sneezing, running nose, and watering eyes of hay fever can witness the change sooner or later to the more severe paroxysms of shortness of breath and the terrifying smothering of asthma. It is the progression from simple to complex, practically from the endurable to the unendurable.

Recent scientific work is resolving the problem into one of relativity, a subject to which so much attention has recently been drawn by a famous German physicist. A variation in the chemical organizations of different individuals has been known for ages. Lucretius, the Roman poet of the first century, before Christ, in referring to so many truths now considered new theories of modern science, said *"Quod ali cibus est aliis fuat acre venenum."* (What is food to one may be fierce poison to others.) "One man's food is another man's poison," is the underlying principle of asthma as demonstrated by recent scientific work. A condition of unnatural sensitiveness to substances ordinarily innocuous has been demonstrated, and on this basis effective measures of relief have been invented. As already inferred, light has been shed where darkness occurred and the way out can be seen clearly.

Most of us have recognized certain personal peculiarities in ourselves, especially in regard to our diet. One has had hives on eating strawberries. Another has never been able to enjoy shellfish. There are babies who are poisoned by cow's milk. Many children have had to avoid eggs alone or even in such combinations as custards or cakes rather than suffer eczema or even asthma itself. I recall a gentleman who could not be deceived by buckwheat however disguised in the kitchen. An acquaintance has an idiosyncrasy for cats. He can feel their presence in a room when he cannot see them. Their unseen presence makes him ill.

Many a horse lover realizes his sensitiveness. Whenever he is about the horses, in the stable or driving, he begins to sneeze and his eyes to water. Similarly unfortunate experiences have come in the garden—to one lady in mind, among the carnations; to another when near roses, even in the house in a vase. By far the best known are the sufferers of haying time when the pollens are in the air, especially the ragweed.

How many water resorts owe their popularity to the effort to avoid such poisoning?

Everyday medicine illustrates the fact in the varying idiosyncrasies, drug or otherwise. Neglecting this fact is tempting fate in handling patients. Quinine, arsenic, mercury, even alcohol, cause serious upsets for some people in even the minimum amounts, ordinarily of benefit.

And so it has been found that certain people are acutely poisoned by substances ordinarily tolerated as inoffensive or even considered a necessary food to the majority. These substances are widely distributed in the animal and vegetable kingdoms, some available only at certain seasons, some all the year round. Further it is known that it is the nitrogenous portion of such substances, the proteins, which cause this trouble.

No light has been thrown on the cause of such differences in individuals, to the extent that one may be seriously poisoned by such a common foodstuff as wheat. In some the sensitiveness peculiar to their chemical organizations must be inherited, a fact deduced not so much from the finding of similar trouble in their parents as from the early appearance of the trouble. In infancy the more common proteins causing asthma are among the first included in the expanding diet, as, for instance, egg, milk, and potato. The earlier the onset of the asthma, the more likely it is due to a foodstuff. The cereal grains are the commonest of all the foods involved, wheat leading. This is especially surprising considering the widespread use of wheat in some form, and yet, just the very fact would render the absolute incidence greater, on account of the greater opportunity. Corn and rice, fish, chicken, lamb, beef, pork, vegetables, fruits and honey are on the list.

What is known as atypical asthma or asthmatic bronchitis becomes the predominant type in the group developing asthma later in life. In them, bronchial infection plays the rôle with predominance of the ordinary pus-producing bacteria, the prevalent organisms in the nose and throat. Such organisms may lurk in tonsils, about dead teeth, and elsewhere as much as in the bronchi. In addition to the actual bronchitis itself, the bacterial proteins may be acting as an instigating poison.

By inhalation, in contrast to eating, two other groups or proteins may enter the body to stimulate bronchial nerve endings and cause asthma. The first group is well known, the plant pollens. The pollens of timothy, redtop and ragweed lead in frequency. When we consider the large number of hay fever sufferers in addition to the asthmatics, how can our large cities tolerate the rank growth of ragweed in the vacant lots and overhanging the sidewalks, especially in the season of pollenization? A complete list is impossible. In spring, the poplar, willow, birch, elm, maple, oak, pine and walnut are available. In summer, orchard grass, June grass, daisy, dandelion, clover, sweet clover, poppy and rose, may take part, though most of these are concerned more in hay fever than asthma. Rose pollen mostly carried by insects is also wind borne. In late summer the list includes goldenrod, goldenglow, sunflower, dahlia and alfalfa. And yet we have stated, in asthma the three chief offenders are ragweed, timothy, and redtop.

The strangest truth of all concerns the other group of proteins inhaled, namely the animal emanations. Strangely too, this is the largest group and would probably be the last to be realized by the average asthmatic. It is one more bit of evidence that science is robbing us of our best and most accustomed pleasures. Maeterlinck must have had the same idea when he said that "all our knowledge merely helps us to die a more painful death than the animals that know nothing." As if Dobbin had not suffered sufficiently in the last ten years, he is now charged with the causation of asthma! He offends nine times as frequently as Tabby!

Horse hair and dandruff rank first in this group. Cat hair, chicken feathers, cattle hair and wool must all be mentioned. Dog hair is the least common cause. With this fact proved, one can imagine the asthmatic among his domestic pets suffering year in and year out without relief, in his innocence.

Of course, we must bear in mind that in the case of each asthmatic the cause is specifically one or a small combination of two or more such factors. All these named do not influence every individual case.

Dr. I. Chandler Walker, to whom the credit of this remarkable demonstration must be given, has listed the percentage occurrence of causes in four hundred cases of asthma.

Animal emanations	16%
Food proteins	12%
Bacterial proteins	10%
Pollens	10%

The remaining 52 per cent are non-sensitive to proteins and have the atypical asthma or asthmatic bronchitis. In this large group, the asthma attack is usually associated with colds and bronchitis, catarrh of the nose and throat, and occasionally infections of the teeth, tonsils, and sinuses. The real cause is a bacterial infection. The patient has suffered from bronchitis for years and this gradually progresses to greater wheezing and greater severity, finally being associated with smothering and shortness of breath. This is the predominating type in those asthmatics with onset past middle age.

It is apparent then that the age of onset will give a

(Concluded on page 12)

Kansas' Latest Challenge—"Fitter Families"

By FRANK M. CHASE

HUMAN beings came into their own in Kansas this fall. They were scored and judged at the state fair! There were classes for children, for adults and for whole families. Medals and certificates were awarded, as well as a special silver trophy for the best family. Thorough mental and physical examinations were required of every entrant. The family history also was taken, while the purpose of the contest was summed up in the slogan: "Fitter Families for Future Firesides."

Eugenics? Exactly; for years the butt of the paragrapher's wit and seldom taken seriously outside forbidding scientific works. Yet under the auspices of this contest more than a hundred Kansas citizens took a good, square look at themselves as present or future fathers and mothers. While breeders at the ringside a few rods away were appraising each cow or horse in terms of its progeny, these men and women seriously took stock of their qualifications for parenthood.

There is a challenge to all the world in this contest. It is, in fact, the latest challenge from Kansas. It means that the people of this progressive state no longer are content to breed only better animals. They are setting out to raise better citizens; to apply to the human race, some of the principles of heredity which have worked wonders in live stock improvement.

The story of the first eugenics contest is one of a big vision; of the friendship of two middle western women; of their steadfast devotion to an idea; of accomplishment. Its beginning dates back to 1910, when at a little county fair in Iowa the superintendent of the art department happened to notice a great many babies who, she thought, were not getting all the attention to which they were entitled. On the spot it occurred to her that the babies might be shown and judged with as much profit to the community as arises from the exhibition of calves and colts. As a result of her idea the first baby health contest in America was held at the Iowa State Fair the following year.

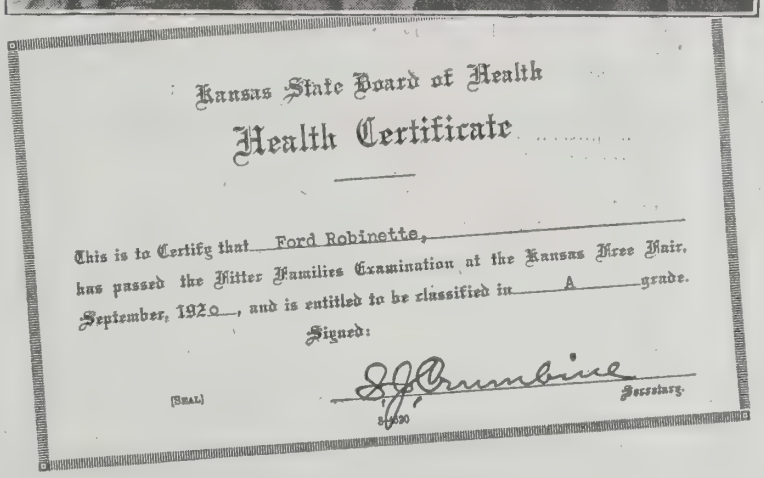
How Mary T. Watts fought for the privilege of holding this contest, her ultimate triumph, and how the baby scoring plan has since grown into the present extensive better babies movement, is in itself an interesting story. But that is the task of another day. Assisting in that first baby contest was Dr. Florence Brown Sherbon, who shared with Mrs. Watts the idea which finally resulted in the eugenics contest. Themselves mothers, both saw the great possibilities in the baby health work, and as it rapidly spread over the nation their conception of it grew. Their vision came to include much more than the present welfare of children: they hoped to see established some means of directing public attention to the mental and physical well-being of every member of the family.

For several years the two women, separated by their respective duties, did not come together. Neither, however, lost sight of the idea. At Lawrence, Kansas, in the spring of 1919, the conversation turned to their favorite topic, eugenics. In view of the success of the baby health contests, they agreed that some competitive plan was likewise suitable for arousing popular interest in the subject. They further agreed that the time was ripe for the eugenics contest, and that the first to have a good opportunity to hold one should do so.

"We ought to have a slogan," said Doctor Sherbon. "How would something about 'fit families' do?"

"Make it 'fittest families'," suggested the impulsive Mrs. Watts, who does nearly everything in the superlative.

"Fitter families," compromised the more conservative physician, and the remainder of the slogan came quite naturally.



A little later Doctor Sherbon came to Topeka as head of the child hygiene division of the Kansas State Board of Health. Thinking that an interesting exhibit might be based upon her excellent work in this capacity, the Kansas Free Fair Association offered her a building to use as she wished. Here was Doctor Sherbon's opportunity. She explained the eugenics contest idea to the secretary of the fair. He heartily favored the plan and in due time "Department S— Eugenics," with Doctor Sherbon in charge, took its place in the premium list. Assisting Doctor Sherbon was her old friend and collaborator, Mrs. Watts.

Physicians and specialists of high standing gave their time and services to this work with no recompense save their expenses. In some cases their services could not be obtained for private practice. Assisting with the mental examinations, for instance, was James C. de Voss, professor of psychology and director of the bureau of educational measurements at the Kansas State Normal School. The physical measurements were in charge of Dr. James Naismith, head of the department of physical education at the University of Kansas, assisted by Dr. Martha Bacon, director of physical education for girls at the same institution. There was also a competent eye, ear, nose and throat specialist, a psychiatrist and a dentist. The women and children were examined by women physicians, among whom was Dr. Florence McKay, a specialist with the Federal Children's Bureau. In all, the staff assembled for the eugenics contest included eighteen physicians and assistants.

Entrants came for their examinations by appointment. On entering the building their family history was taken. They then passed through a series of booths, in which the staff specialists made their respective examinations. In one booth, for instance, the person was measured in every conceivable manner to determine his physical development. In another he was subjected to all sorts of questions and tests to determine the status of his mental and nervous systems. In another he wrestled with the army intelligence tests, usually leaving some of his conceit in this booth. In still another he left some of his blood for the Wassermann test, and so on until everything mortal about him was thoroughly invoiced. About three hours were required for examining one person.

Probably a more comprehensive and constructive health examination than that given in this contest was never offered. The immediate value of the information dispensed as a by-product of the contest was well illustrated by the case of one rural family. A child of this family was considerably underweight. In the course of the examination the father received some tactful suggestions as to food which would aid in restoring the youngster to his proper quota of flesh. As usual, the prescription called for goodly allowances of milk, eggs, fruit and vegetables. The father was both pleased and a bit ashamed. "I'm glad we came," he said, promising that his boy would get the kind of a diet that he needed. "We have been living right on a farm all these years without ever knowing how valuable were the foods we had at home."

Kansas State Board of Health

Health Certificate

This is to Certify that Ford Robinette,
has passed the Fitter Families Examination at the Kansas Free Fair,
September, 1920, and is entitled to be classified in A grade.

Signed:

(Seal) Secretary.

The family of Ford Robinette, Shawnee County, Kansas, winners of the trophy in the first eugenics contest. Left to right: Mrs. Robinette; Lois 18; Mr. Robinette; Mamie 15; Ivan 12.
Duplicate of Ford Robinette's Grade A health certificate.

While planning the contest Doctor Sherbon looked for only a few entrants. The number of persons examined was to her a secondary consideration; she felt that the contest would be entirely justified if it no more than started an interest in eugenics. Her big objectives were two: to work out a set of standards for the normal family and to develop the technique of such contests. No one was more surprised than she, therefore, when there were more applicants than the staff could handle. Mrs. Watts' megaphone was decidedly unnecessary. The contest lasted a full week, but after the first day or two there were no breathing spells for the doctors, indeed, scarcely time for luncheon. Preference was given the family entries, though before the contest closed they too were being turned away. As indicating a growing consciousness of the importance of being well born, such interest was gratifying indeed.

Though in the main the younger families were most interested in the contest, its appeal was not to them alone. Several families with well-grown children entered. In one family three generations were represented. Sometimes it was the older members of the household who urged participation in the contest. "Go ahead and take the examinations, Maggie," one elderly woman admonished her daughter, who had children of her own. "They didn't have such things in my day, or you bet I should have been into them."

There was, in fact, a certain irresistible psychology about the contest which drew many persons to it. In a number of cases the husband or wife, unsuccessful in interesting the remainder of the family, took the examinations alone. Almost invariably, however, the enthusiasm so generated resulted in the rest of the family being on hand for the examinations the next day; they wanted to have the family health record complete.

This they could have, for at the close of the contest the results of the various examinations were assembled in a written report, a copy of which was given to each individual or family. Although the contest was in no way a clinic for sick persons and no one obviously ill was admitted, advice as to what individuals should do to bring themselves up to perfect condition, as in the case of the under-nourished farm boy, was given.

In the class of persons examined was further proof of the soundness of the eugenics idea. They were representative of the best citizenry of the state, lending their approval and encouragement to the plan by their presence. The false pride which often attends matters medical also was absent. Among those taking the examinations were well-to-do families of high social position. Included in the list were the families of a prominent district court judge, of a lawyer, a Y. M. C. A. secretary and of numerous farmers. Several young women who were engaged to be married and one or two single men also passed through the eugenics "mill."

A farm family won the sweepstakes of the eugenics contest, the silver trophy given by Governor Henry J. Allen. This was to be awarded the family receiving the highest grades for all its members; but, as three families tied for the highest score, the cup went to the one having the most members. This was the family of Ford Robinette, in which are three children. The other two families each consisted of a father, mother and one child.

Robinette operates a large farm in Shawnee County, which has been the family home for fourteen years. Before their marriage both parents taught school. Lois, the eldest of the children, is eighteen and a sophomore in college. Mamie, fifteen, and Ivan, twelve, are in high school. The entire Robinette family is fond of outdoor life, the children especially enjoying to ride horseback. None of them ever has suffered from serious illness.

"We entered our family in the eugenics contest," said Mrs. Robinette, "only to show our approval of the 'fitter families' idea. We had no particular ambition to win the trophy."

In all, eighty-seven adults and fifty-three children were examined. Of these, one hundred and one were the members of twenty-five different families, all of which competed for the governor's trophy. Forty-five of the one hundred and one individuals were parents, one was a grandmother, fifty were children, while five persons received no score because of failure to complete the examinations.

The entrants were scored A, B, C or below; A indicating a grade of from 90 to 100, B from 80 to 90 and C from 70 to 80. It is gratifying to note that among the twenty-five families there were no scores below B. Forty persons received this grade, while fifty-six were in the "A" class. Every Grade A entrant received a medal given by United States Senator Arthur Capper and a "Certificate A" from the Kansas State Board of Health. Grade B entrants each received a board of health "Certificate B."

"The governor's trophy or one of the Capper medals is worth more than any sweepstakes of the live stock showing, or a Kansas oil well," says Doctor Sherbon; "for health is wealth and a sound mind in a sound body is the most priceless of human possessions."

"I am most enthusiastic about this work," said Doctor McKay, who found her admiration for it increasing with each day's tasks, strenuous as they were. "I was impressed particularly by the amazing willingness with which the entrants put up with inconvenience and often tedious waits in order to complete their examinations."

"There are wonderful possibilities in the eugenics contest idea," said Dr. W. R. B. Robertson, of the University of Kansas. "The records gathered in such contests will provide an excellent basis for studying the laws of inheritance in human beings."

An interesting comparison between the improvement of animals and of human beings was made by Mrs. Watts. "Farmers started in to improve their live stock by better housing and more careful feeding," she said, "but they still raised scrubs. It was not until they discovered that heredity was a factor in stock improvement that any great change in the grade of live stock took place.

"Infant mortality is still appalling. Our institutions for the insane and the feeble-minded are full to overflowing. Taxes for the support of these institutions, including the penitentiaries which take care of our social derelicts, have weighted down heavily the normal members of the community. What is the trouble? We are studying balanced rations, sunlight, fresh air, better schools and recreation; but still the number of unfortunates increases. We must go further; we must place more emphasis upon the factor of heredity."

The eugenics contest is a step in this direction. Who can say to what length it shall attain in bettering the nation's best asset, its citizens?

School Days of Our Presidents

By CARL SCHURZ LOWDEN

OF THE twenty-seven men who have occupied the nation's highest office eighteen attended college; only two of this number, James Monroe and William Henry Harrison, did not graduate. Senator Harding will be the nineteenth collegian.

The institutions of learning that hold the foremost rank as educators of Presidents are Harvard and William and Mary, as each has a score of three. John Adams and John Quincy Adams, also Theodore Roosevelt, finished at Harvard. Jefferson, Monroe and Tyler are the sons of William and Mary. Princeton has two representatives on the roll of Presidents, and Yale one.

The younger Adams sharply protested the action of Harvard when it bestowed the degree of doctor of laws upon Andrew Jackson whom cultured people regarded as an uncouth, illiterate backwoodsman. "As myself an affectionate child of our Alma Mater," he said, "I would not be present to witness her disgrace in conferring her highest honors on a barbarian who could not write a sentence of grammar and hardly could spell his own name."

Jackson was self-taught, and certainly was no scholar such as his predecessor. Caught in the sweep of the Revolution, the daring lad of thirteen years promptly "joined in" against the British. He had first attended a Carolina school kept in a log pen twenty feet square and there acquired a smattering of the three R's. He made no progress in spelling. When he became President his enemies circulated the story that he endorsed papers with the symbol, "O. K.," which he believed to be the initials of "All Correct," misspelled by him as "Oll Korrect." As there is another story of the origin of the phrase, this version must be considered doubtful.

Another sufferer in the clash between patriotism and the desire for an education was James Monroe. He went to college in 1774, left a year later, and immediately obtained a lieutenancy in the Third Virginia Regiment. Roosevelt characterized him as "a very amiable gentleman but distinctly one who comes in the category of those whose greatness is thrust upon them." What might have been said of him if the war had begun in 1779 or 1780?

School in Paris did not interest John Quincy Adams, so his father sent him to the University of Leyden, in Holland. For a time he served as private secretary to an American representative whom the Russian Government refused to receive. The boy then told his father that he thought "an American education to be best for an American career." Accordingly he returned to his native land, entered Harvard, and graduated at the age of twenty-one. The elder Adams, either precocious or probably given a smoother preparatory schooling, completed the course at Harvard when he was nineteen.

As a freshman in college Thomas Jefferson participated in festivities of a riotous sort. He soon saw, however, that such conduct would get him nowhere; so he swung to the other extreme, began to discuss philosophy and government with members of the faculty, and often spent as much as fifteen hours on his studies in a single day.

Franklin Pierce nearly let his martial ambition and enthusiasm for the study of military tactics prove his undoing. He served as an officer in a company of college students, and at the end of two years found himself at the foot of his class. The disgrace of the situation stung him. He resolved to pull himself up by his bootstraps or otherwise. He turned his attention to the subjects which he had neglected with the result that he ranked third in his class when the "sheepskins" were handed out.

The tanner's son, Ulysses S. Grant, made no flashy record at West Point. Rather he moved along with the steadiness of an old plowhorse; and, indeed, he liked to tinker with horses far better than with mathematics. At graduation he stood twenty-first among his thirty-eight classmates, but he excelled them all in horsemanship. It is true that an individual can invariably do best that which he likes most.

The schools of the pioneer days were imperfect one-room log cabins with few windows and scanty equipment. The masters were learned in Latin and Greek, and firmly believed that the sparing of the rod spoiled the child. Yet many of our Presidents received their first training in these meager institutions.

At least one of our Presidents, possibly two, never went to any kind of a school. The father of Andrew Johnson died when the lad was five years old, and his mother could not spare the money to educate him. This condition of poverty caused Andrew to be apprenticed to a tailor. He worked long hours and hard. One day a man brought a book to the shop and recited many selections that it contained. Andrew's ambition was stirred. With the man's help he learned the alphabet. But he made no real progress until his marriage. His wife read to him as she plied the needle. She helped him to learn to read and write. She was his school. Largely through her careful, patient instruction he was enabled to become the mayor of the town in which they lived.

The term "self-made" can be accurately applied to Abraham Lincoln. His total schooling consisted of only five months, two to one teacher and three to another. He did sums and practiced writing on a wood shovel which he shaved with a knife to obtain a clean surface. He often walked long distances to borrow books. One volume was ruined when rain penetrated through a chink in the log cabin, and the owner required the boy to work out its value. The lad's stepmother helped him all she could. He had an indomitable will to obtain an education, and he did. When he learned to write he penned letters for his friends; this unselfishness and practice improved his penmanship and his ability to express thought.

Washington never sought the advantages of college training. He was content with the common school where he mastered the three "R's," geometry, and surveying. During his sixteenth year he quit to become a surveyor of lands. When he was fourteen his half brother obtained a place for him in the English Navy, but his mother objected, and he did not go. Thus was he saved for his great work as a military leader and as the nation's first President.

At the University of North Carolina a young fellow named Polk proved himself correct, punctual, and industrious. He delivered the Latin salutatory because he stood first in classics and mathematics. Many years later at Kenyon College a similar honor came to young Rutherford B. Hayes as valedictorian of his class.

Polk's predecessor, John Tyler, was the ringleader in a school rebellion and mutiny when he and his mates overpowered a despotic teacher, bound him, and left him in the building until late at night when a passer-by rescued him. The scholars had evidently concluded that the man, McMurdo, was as bad as his name. He complained to Judge Tyler who dismissed him with the warning, *"Sic semper tyrannis!"* Long afterward John retold the story of the cruel principal, and commented, "It was a wonder he did not whip all the senses out of his scholars."

Another Scotchman, Donald Robertson, was the master of a school which James Madison attended. Unlike McMurdo, he did not abuse his pupils or heap injustice upon them. Madison suffered from overwork at Princeton, but when he recovered his health he took the studies of the last two years in one. After getting his degree of B. A. he remained at Princeton another year to do special work in Hebrew under Doctor Witherspoon, head of the institution. He then returned to his home, tutored his younger brothers, and began a systematic course of reading in theology and philosophy. Madison apparently was preparing himself for the ministry, but he subsequently abandoned it for law and a career of public service.

Since the administration of William McKinley the Presidents have been graduates of large colleges. Roosevelt was a Harvard man. Taft and Wilson are products of Yale and Princeton respectively. Senator Harding's Alma Mater, Union Central College, through which he earned his way by driving a team in the construction of a railway grade, has long been dead. An obscure or a dead institution is no discredit to a President, however; for a man must be potentially great before he can become great, and such a man plus a strong will is sure to make his mark with or without the assistance of a college. Washington and Lincoln are conspicuous examples of the self-taught, Roosevelt of the well-schooled.

Five of the Presidents received their education in the colleges of Virginia: Jefferson, Monroe, and Tyler at William and Mary; Buchanan at Dickinson, and William Henry Harrison at Hampden-Sidney. Massachusetts colleges educated four: the Adamses and Roosevelt at Harvard, and James A. Garfield at Williams. Ohio's list includes Rutherford B. Hayes, of Kenyon, and Benjamin Harrison, of Miami. When Senator Harding moves into the White House on or about the fourth of March, 1921, Ohio's collegiate count on the roll of Presidents will reach a total of three.

The Problem of Asthma

Concluded from page 10

a hint of the type. Often the patient himself will know of his susceptibility to poisoning by some food, to corn, or lamb, or strawberries, for instance. In others their occupation and surroundings are suggestive. Instances are cited of bakers sensitive to wheat flour, of hostlers to horse dandruff. Walker found a sifter of green coffee suffering from asthma due to protein of the green coffee husks. Two jewel polishers had asthma, the first from the dust of boxwood, the second from the dust of orangewood, employed in their daily work.

The most reliable way of demonstrating this sensitiveness, however, is by the so-called skin test. A series of cuts not deep enough to draw blood or even cause pain are made on the inner surface of the forearm and on them is placed a solution of the specific proteins to be tested, those suggested by the patient or a group of a few of the most commonly involved foods, bacteria, pollens, and animal emanations. Such a list might include egg, milk, cereals, meats, chicken and potato; the bacteria, staphylococcus, streptococcus, and pneumococcus; timothy, redtop, and ragweed; horse hair or dandruff, cat hair, and feathers. In one-half hour the reactions are noted and compared with controls on which no protein was placed. A positive reaction consists of a white wheal about the cut, in fact, a hive, which measures at least 1-5 inch in diameter.

The problem becomes more complex when the same individual is sensitive to more than one protein, to a combination of proteins from the food, bacterial, plant and animal sources, as is not uncommonly the case. Such a person will give positive reactions to all of them, especially if having been recently poisoned by them.

In past years the efforts at treatment were by necessity confined to relieving the attacks after they occurred. More fundamental measures can be taken now, to preclude the possibility of attacks. Asthmatics may either be protected from exposure to their poisons by change of environment or removal of the poison, or the individual may be so changed by treatment as to be rendered in time not susceptible to these poisons. The easiest measure with foods is to remove them from the diet. This is most successful, although sufficient cooking at high temperatures destroys the poisonous character of such foods in some cases. For instance, those sensitive to potato or milk may eat baked potato or boiled milk with impunity. Sometimes small amounts of such a food can be eaten when large amounts are poisonous. In children only careful, prolonged treatment has succeeded in rendering them non-sensitive to these specifically poisonous foods.

In the case of the animal emanations, frequently the easier treatment is to avoid exposure, to change their surroundings, or get rid of the offending animal. However in the horse, cat, and dog cases, the status of the individual can be changed—he can be desensitized by successive inoculations under the skin of increasing dilutions of the special protein. Improvement occurs quickly and can be carried to an entire lack of sensitiveness. Even the previously positive skin test becomes negative.

With plant pollens and bacteria, similar inoculations are successful. With pollens this should be accomplished before the season instead of during it. Much care is required in determining the dosage and its increase. Reactions should be avoided.

With the non-sensitive group bacterial vaccines offer the hope of relief. However, the older the patient the less hopeful the undertaking. Relief will vary with such an individual's resistance and so may not be permanent. Succeeding courses are often necessary and yet they give more prompt results the second time.

One conspicuous change in handling asthma has been dispensing with the numberless and repeated nasal operations to which asthmatics were subjected. In fact it has been said by one author that "conscientious nose and throat specialists have now learned to refrain from removing everything in their operative field for asthmatic conditions."

The changed outlook cannot be over-emphasized. Though death never occurs in an attack, yet an asthmatic never outgrows the condition or spontaneously becomes cured. Such reputed instances are generally due to the removal of the offending protein poison. With the proper treatment the outlook is excellent in the sensitive cases, and hopeful in the non-sensitive asthmatic bronchitis.

Where Christmas Takes Place of "The Fourth"

Concluded from page 3

orange hedges gleamed in the morning's light, when the Christmas guns are fired from the upper porch, the hunting horns wind joyfully, and small boys, and big boys, too, steal down into the yard to fire off the crackers that delight them. Early as it is, a regular fusillade is kept up for an hour or more, guns, pistols, horns, firecrackers and squeaking trumpets maintaining an unceasing racket.

For the older darkies there is no time like Christmas for a trip back to old "marsah's," or to see the sister or brother who lives on some distant plantation. Black daddy and black mammy look odd enough going Christmasing, tricked out in their Sunday best, with all sorts of bundles and budgets dangling here and there, and an old-fashioned carpetbag, fat to bursting, swung at the horn of the saddle. If mammy can get the loan of a buggy or wagon to go in, so much the better, but if not, she will ride a mule or even an ox, and the particular pullet she has destined for "young Mass' Henry's baby chile" will be tied on along with the other parcels and go with her.

Changed conditions in the South make it possible for the landowner to give presents only to those Negroes whose work brings them in direct contact with the family; but all who come to pay their respects on that day understand that they are to remain for dinner, and the kitchen is filled with a joyful company.

"What for does dey keep Christmas, Missie?" asks Daddie Hector, who has come out from his cabin beyond the mill ostensibly to bring a hoary old owl for inspection, but in reality to get his Christmas dram. Daddie Hector is an octogenarian at least. No one can exactly guess his age, and he is as gnarled and bent with accumulated years as one of the native live-oak stumps. A rare personage among Negroes, he refuses to attend meeting, or even have the pastor visit him.

On being told the religious meaning of the Christmas festival, he ponders on it for several seconds, then bursts out:

"Please, Marsah, den, 'cordin' dat exterpation, dis here time is worse dan Sunday."

There is a great deal of Christmas down South. The love of it and the pressing observance came directly to the people from their English forefathers, of both high and low estate, who peopled Virginia and the Carolinas in the long ago. Their descendants have spread out over the face of the country, and the old traditions and customs yet obtain in a marked degree.

Humanizing Gateway to the Land of the Free

Below—Immigrant boys playing leap frog while one of the assistants to the Commissioner of Immigration at Ellis Island acts as referee.

Top—Types of future Americans listening to an address on the wonderful land in which they are about to begin a new life.

Center—These foreign-born boys never saw a football until they arrived at the island, but they take to the great American fall sport like ducks to water.

Bottom—The daily phonograph concerts on the island prove a potent attraction to the little people from overseas. Jazz records seem to be the most popular.

The Origin of Sports

By FRANK DORRANCE HOPLEY

CRICKET

CRICKET is the national game of England but is comparatively little known in this country. It is rarely played here except by the clubs of Philadelphia, Baltimore and New York, and a few other places where there is a colony of Englishmen.

Mr. H. G. Hutchinson, in his book on cricket, observes at the outset that:

"Cricket began when first a man monkey, instead of catching the cocoanuts thrown at him playfully by a fellow anthropoid, hit them away from him with a stick which he happened to be holding in his hand. But the date of this occurrence is not easy to ascertain and, therefore, it is impossible to fix the date of the invention of cricket. The first use of the name 'cricket' for any game is indeed a matter entirely of conjecture. But whether the name was applied by reason of the cricket or crooked stick, which was the early form of the bat, or whether from the cross stick used as the primitive bail, or from the cricket or stool at which the bowler aimed the ball, really it is not very much matter."

It is evident that the present form of cricket is an outgrowth of an athletic sport of very ancient times. It is well known that some of the Olympic games of the Greeks included striking a ball with a stick or club, and that the Persians also played a very similar game. The Saxons and also the Normans used to play at "club ball," as they called it, which may have been the father or, at least, one of the ancestors of the cricket of today.

A writer has stated that "the earliest mention of cricket playing in England is in the poetic writings of Joseph of Exeter, 1180, who sings in old style:

"The youth at cricks did play
Throughout the merry day."

Chaucer also mentions cricket in his "Canterbury Tales."

"In a proclamation by Edward III, 1363, cricket is alluded to under two Latin words denoting the ball and bat sport."

"In the university laboratory at Oxford," says Joseph Strutt in his "Sports and Pastimes," published in 1801, "is a manuscript dated 1344, which represents the figure of a monk in the act of bowling a ball to another who elevates a straight bat to strike it. The game is called "club ball," and the score is made by hitting and running as in cricket."

In 1685, in a book entitled "The Mysteries of Love and Elegance," by Edward Phillips (nephew of the poet Milton), is found a somewhat remarkable statement in respect to some difficulty which he had experienced with a lady:

"Would my eyes had been beat out of my head with a cricket ball, the day before I saw thee."

That the game had an early hold upon the nobility is evidenced from an announcement in *The Postman* of July 24, 1705, which reads:

"This is to give notice that a match at cricket will be plaid between eleven gentlemen of the West part of Kent and those of Chatham, for 11 guineas a man, the game to take place at Maulden in Kent on August 7th next."

To trace the origin of any game which, while not born complete, has progressed by the slow process of evolution, cannot be done successfully unless the growth of each component of the game is accounted for. Mr. Read has done this in an interesting manner. He takes first the evolution of the bat.

"With regard to the bat, this would first of all take the form of a piece of stick; then something stronger, in the shape of a club would be used, and as the bowling improved, something that offered a better protection to the wicket became necessary, and then took the form of a bat, a name possibly derived from the fact that first of all it was shaped out of a common piece of wood, known in all times as a batten.

"Before 1745 a bat of any size could be used. Later with improved methods of bowling, bats were built more upright and of a tougher kind of wood, and it is to J. Small, Jr., the celebrated cricketer and batmaker of Petersfield that we owe the original bat with a shoulder."

The art of bowling has also grown with the growth of the game itself. Mr. Read says that "it was not until the end of the last century (the 18th) that bowling became much of an art. Home tosses and half volleys were probably unknown, and the first step toward improvement from the common grounder or sneak was the pitch and lob. Then followed some sort of twist and a rude imitation of throwing, or round arm bowling.

"As to the wickets, in the early days of Britain, they were represented by a trunk of a tree; following this primitive idea would be two pieces of stick—two straight ones with a piece laid across the top, or anything in the shape of an obstacle for the bowler to aim at. As early as 1705 the wickets were pitched at the same length as they are at present."

The game of cricket seems to have flourished to a greater or less degree wherever Englishmen were found. In South Africa, New Zealand and in Australia it is played with as much zest as in the mother country. In the West Indies, every town of any size has its cricket club. In Trinidad, Barbadoes and Demerara there are clubs composed of Negroes who have developed into as fine players as the whites.

In the United States, however, the game has but a small following. It does not appeal to the average American, who likes quick play and "something doing" all the time. A cricket match is a lengthy affair. Sometimes it lasts for two or three days. This does not suit the man of America who is interested in sport. He wants to know the score before he goes home from his day's work.

England's Dye Industry: A Burning Question

Question of Importation of German Products Threatens Crisis for Lloyd George; Liberal Supporters Demanding Free Trade

By W. P. CROZIER

Manchester, England, December—(By Mail).

THE lists are set in England for a battle-royal over the question whether we shall or shall not import dyes from Germany and, if we do, under what conditions. In a few weeks it will be what is called a "burning question." Americans, accustomed to high protection, may be astonished that there should still, even after the war, be a hot controversy over such a question, but in fact the issue between Free Trade and Protection is as much alive in this country as ever. It only sleeps, or rather it is allowed to sleep, because more than anything else it is calculated to trouble and split the Coalition which keeps in office Mr. Lloyd George and his government.

This issue came up twelve months ago. Mr. George's Government introduced what was known as the "Anti-Dumping Bill." It took its name from certain provisions which were to prevent the "dumping" of foreign goods into this country or in other words the sending into our markets of goods at a lower price than—to use the two definitions current—the cost of production in the country of origin or the price fixed in that market. The government adopted these two definitions successively. In general the bill was a Protectionist bill.

The Liberal supporters of the premier took alarm. They told him that they were with him to the death—unless he betrayed Free Trade, in which case they could no longer be relied on to support the Coalition. When the premier went into the country and addressed a great Liberal club of which he was president, member after member got up and in affectionate but firm words told him that they would not have the Government's Protectionist bill. Mr. George smiled upon them. We shall have plenty of time, he said in effect, during the long winter evenings to consider the future of the bill in the light of what you have said to me. He smiled again genially. "I don't know that I much like the bill myself," he said. And so, with a nod and a wink, the first legislative attack of the Coalition Government on Free Trade was disposed of. The anti-dumping bill was not heard of again. A second blow to the Protectionists followed when Mr. Justice Sankey declared illegal the action of the government in using not legislative enactment but mere executive decrees (the so-called Orders in Council) to prohibit the importation of long lists of articles from foreign countries.

So the Coalition Government has been in office now for almost two years and the Protectionists (roughly identical with the Unionist party) have gone unsatisfied. Now they are becoming clamorous for satisfaction and in the forefront they put the demand that the young and growing British dye industry should be protected against the German competition which kept it small and insignificant before the war and is likely enough to cripple, if not to destroy, it in the future unless measures are taken to safeguard it. A very simple case, the Protectionist will say. Certainly it is a very strong case, for it is not merely a commercial matter. It is not like the question of importing pianos or motorcars. It involves the national defense. We found out during the war that the processes of the chemical industry were essential to us for our proper equipment with explosives and chemical weapons of all kinds and at first we suffered because we had not our own dye industry but had for many years relied almost entirely on the great German firms. If there is ever to be another war, we said to ourselves, we must have our dye industry in our own hands, for perhaps on the next occasion we shall not be given the time to develop a great industry from almost nothing.

Of course, this is the most powerful argument in the hands of the government. The political Protectionist says plainly that since we began to foster and build up great dye plants during the war, it would be madness now to expose them to the full force of German competition. During the war we secured the amalgamation of the two principal dye-producing firms in the country, the government invested nearly £2,000,000 in the concern as proof that it regarded its stability as important to the state, and the great corporations which are the principal users of dyes gave their support. It is likely enough that much of this effort will be thrown away if the Germans are allowed to get to work—and at the moment there is no restriction on the importation of dyes into this country. Besides, when the combine was formed and the British Dyestuffs Corporation was established, the guaranty of government assistance was held out to the public as a means of attracting capital, and the government is therefore under an obligation to redeem its word.

So much, then, for the forces on one side: the doctrinaire Protectionists want to establish a principle, the dye manufacturers want to maintain their profits by keeping out German competition, and the government insists that this is, from the standpoint of the national interest, a leading "key" industry. On the other side are the consumers of dyes, who are greatly alarmed at the prospect of the dye and manufacturing industry establishing a monopoly which would hold them at its mercy.

The textiles industry is the greatest of our export trades and before the war it enjoyed the benefit of the cheap and good dyes which the German dye firms placed at its disposal. The Germans employed large staffs of research chemists and produced dyes which we could obtain nowhere so cheaply and often not at all. This cheap supply of excellent dyes was one of the valuable assets of the textile trader. Now it is in jeopardy, and the dye-users in Lancashire and elsewhere foresee the possibility that they may be forced to use inferior dyes or, if they obtain the dyes which they require from the British manufacturer, to pay a higher price for them. That will be very dangerous, for the export cotton trade has normally been conducted on a narrow margin of profit which would now be cut into by increased charges for dyes, while Lancashire's foreign competitors would be able, if they chose, to avail themselves of the full supply of German dyes at the cheapest possible price. Before the war, the value of the dyestuffs imported into England when compared with the value of our export cotton trade was only in the ratio of one to a hundred. Why then, say the textile traders, should the government seriously propose to assist a small industry like that of dyes at the certain cost of injury, which may be grave to the most important of all our export trades? And this is sound common sense if it covered the whole ground, which it does not. The problem is really—at all events to Lancashire textile men—how to find some form of compromise which will give the dye-users the materials which they must have in cheap and satisfactory form while meeting the needs of national defense, whatever they are finally found to be. The government, for its part, has also to find a means of fulfilling its pledge to the British Dyestuffs Corporation.

Several methods are now under discussion. The intention of the government is to introduce a licensing system under which a license will have to be granted by a government office or board for the importation of a particular dye or dyes. If there be no license, there will be no importation. Some suggest that such a board would have to consist of an equal number of dye-producers and dye-users with a neutral chairman. The dye-users say that as the principal interest concerned they ought to have a majority of the members. But in any event they resist the license system strongly. They say, speaking from experience gained during the war, that a license system will expose them to injurious delays and uncertainty. It is the custom of their trade to send out samples of new printed goods to foreign markets. Then the report returns to them that a certain sample has "caught on," and at once large quantities of that particular cloth are required for that market. The market and the orders will not wait. But for that cloth some special dye or dyes may be needed. It would have been useless to order it before because, until the report came about the sample, it might not be needed. But now it has to be obtained in a hurry. With free importation it could be so obtained, but under the proposals of the government the exporters would have to make their demand to the board and convince it that a license ought to be issued for the importation of the special dyes.

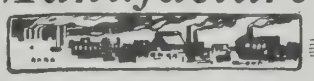
Besides no one knows exactly what kind of dyes are likely to be licensed and what not. It may be that the board would tend to exclude all such dyes as the home manufacturer could produce in a reasonably cheap and satisfactory manner. In that case, say the textile interests, the manufacturer will have a monopoly and will be in a position to make the users pay through the nose. Or the board may exclude the dyes that are not produced here cheaply or well, in order to give the home manufacturer a chance of extending and improving his output of them. But this, says the textile critic, means that the user will have to put up with inferior and dearer goods while the producer is working up to the German standard, provided that behind the shelter of the license he thinks it necessary to work up to it at all.

The dye-users are cudgeling their brains to discover how the government may subsidize the dye-makers without penalizing the textile trade. One proposal is that a moderate tariff—say 10 per cent—be imposed on all imported dyes and that the revenue form a fund from which the government would help the dye-makers. But the idea of a tariff is not popular and in any event so moderate a tariff would certainly be useless to protect the infant dye industry against the attacks of the powerful and highly organized German corporations. Another suggestion is based on the belief that what the government wants for purposes of national defense is a generous supply of expert research chemists and that the government should therefore maintain the research work and research staffs of the dye-makers while leaving to them all the commercial profit that might follow from the work of the researchers. The government will probably reply that it requires not only research staffs but an adequate supply of chemical plant also should be available at the opening of the next war and that the subsidizing of research would not be sufficient in itself to protect the industry and thereby to maintain in being the necessary plant. The root of the trouble is that it is impossible within a few years, however much research work we may do, to compete on even terms with an industry which, like Germany's, has been built up by long and patient labor.

There lies the difficulty. The government has promised protection to the dye-makers and can fulfill its promise only at the cost of injury to those who export textiles to foreign markets. A high tariff will be injurious; a low tariff will fail to achieve its purpose. The dye industry cannot live if it is exposed to German competition. If it withers, the plant and the research work which the government needs in the national interest will disappear also. The government can maintain research work and that will give it chemists if another war breaks out. But research work will not be sufficient to save the industry nor enable it to maintain the plant which the government may need. We have only a choice of evils.

Mexico's Beautiful Memorial to a Great Patriot

Under the administration of Porfirio Diaz, who took office upon the death of Benito Juarez, large sums of money were spent to beautify the national capital and erect memorials to great figures in Mexico's history. Among the many beautiful things that afford such striking contrast with the poverty to be seen in the streets of Mexico City is the court placed on the Avenue Juarez in memory of the patriot who suffered so much that Mexico might be free. The life of Benito Juarez is one of the most interesting in Mexican history.



The Three Arts

Agriculture

Manufacture

Transportation

According to the secretary of the Kansas State Board of Agriculture, Kansas farmers planted this fall the third largest acreage to wheat in the history of the state; greater by 2,708,742 acres than the average annual acreage for the crops of the five-year period prior to the World War, 1909 to 1913 inclusive. However, this acreage is 6.3 per cent less than the crop of 1919 which amounted to 11,610,445 acres.

British India, Egypt and the United States ordinarily produce from 80 to 85 per cent of the world's cotton. The prospective production this year is 16 per cent larger than that of 1919.

The Guaranty Trust Company of New York has issued a new foreign trade booklet designed to be of service to those interested in trade with the southern countries. The title of the booklet is "Essentials of Trading with Latin America." It deals with the problems of finance and exchange, transportation, credits, insurance, consular requirements and methods of packing and marking. It is of particular interest to those who are interested in Latin-American trade.

A carload of purebred cattle valued at more than $25,000 was recently purchased at the Pacific International Live Stock Exposition in Portland.

India has turned from a silver to a gold standard. For the first time on record the shifting of an excess of merchandise exports to an excess of imports, coupled with a changed exchange and currency system, has caused the nation to export silver to get gold.

According to the comptroller of the Shipping Board, losses are being shown on practically every voyage undertaken by a Shipping Board vessel. Private lines are said to be experiencing similar difficulties.

The deflation of values has driven a London concern, which is one of the largest fur brokers in the world, into voluntary bankruptcy.

Senator King, of Utah, is preparing amendments to the Sherman Anti-Trust Law which he declares will increase the control of the Department of Justice over combinations in restraint of trade.

Michigan growers took the first 22 awards for rye and nine of the 14 awards for Red Rock Wheat at the Chicago International Hay and Grain Show.

Attracted by the high rate of exchange, counterfeiters are circulating bogus American money in Germany. One $10 bill was detected because "America" was spelled with a "k" instead of a "c."

There are 20,350 tractors in use on Michigan farms, or approximately one for every 10 farms in the state.

The Standard Oil Company of California is preparing to drill for oil in the Philippine Islands.

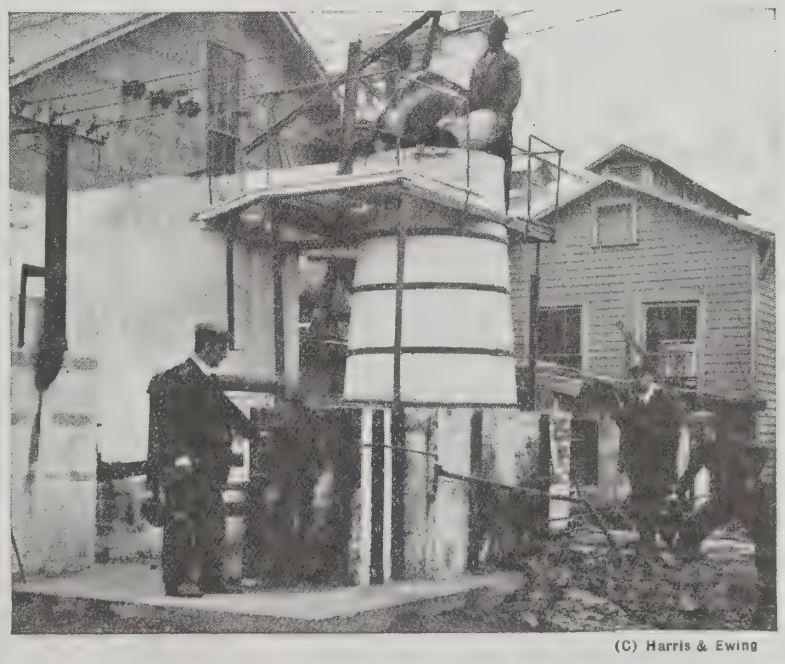
The Chamber of Commerce of the United States opposes the creation of National Railroad Boards of Labor Adjustment, lately advocated by railroad employes.

The Department of the Somme in France has been able this year, not only to meet its own agricultural requirements, but to send more than 300,000 metric quintals of corn to other departments of the republic.

The day of the river packet seems to be returning. High freight rates on the railroads have made it profitable for the steamers to operate again and 30 of these craft have gone back into business on the Mississippi this season.

A Chamber of Commerce has been organized at Manila. All the members are Americans.

Two hundred million dollars has been appropriated by the Japanese Government for the construction of new railway lines. The same amount is to be spent as a first installment for the electrification of state railways and the substitution of standard gauge for the present narrow gauge.



England and other European importing countries do not appear so keen for wheat supplies as they were. Some of the English mills situated at the ocean ports have commenced to run on short time, because of the very large stocks of flour now available in that country. Stocks of flour and wheat combined are over 33,000,000 bushels as against 12,000,000 bushels for last year at this time. This would indicate that depressed wheat prices are not due entirely to market pressure in the United States.

The aggregate net deposits of 823 member banks as of October 29, 1920, were about 10.3 times their reserve balances with Federal Reserve banks.

A wireless message from Moscow states that the Supreme Economic Soviet of Russia has issued a decree permitting foreign capitalists to work the natural resources of Russia, receiving in return the right to export a portion of their production. The Soviet promises the foreign capitalists that nothing they invest in Russian undertakings shall be nationalized, requisitioned or confiscated and that capitalists shall have the right to engage workers and other employes in accordance with the existing Russian labor laws.

Countries normally producing three-fifths of the world's crop of rice report an estimated 1920 production of 151,000,000,000 pounds, which is a gain of 37 per cent over the crop of 1919.

A Discovery in Fertilizers

(C) Harris & Ewing

Scientists of the United States Department of Agriculture believe they have made a discovery which may revolutionize the fertilizer industry of the world. It consists of an economical method of extracting phosphoric acid from phosphate rock. The department's experimental station, shown in the accompanying illustration, has made several experimental runs in which chemists were able to recover 64 per cent phosphoric acid. A 16 per cent recovery was the best method obtained prior to these experiments. The fuel consumption is 15 per cent of the value of the product, or about 7 per cent below the records of previously tried methods.

A world's industrial exhibition will be held in London, May to October, 1922.

The Department of Agriculture is about to make experiments in sending market reports to farmers by wireless. The trial service will be confined to counties adjacent to the District of Columbia.

The common barberry is being eradicated through the efforts of the Department of Agriculture which has found that the shrub harbors rust spores during the winter.

Formerly worthless marshlands in Maryland have been devoted of late to muskrat farming. The venture has been very successful.

It is not true that farming as a whole has deteriorated in the United States or that soils have been impoverished, that acre yields have dropped or that the increase in population has outdistanced the production of food. For the last forty years, the increases in yield per acre are as follows: potatoes, thirty-three; wheat, twenty-five; oats, twenty-four; hay, twenty; corn, ten; cotton, three and one-half; or for all crops sixteen per cent. Some explanation for these increased figures is to be found in better agricultural methods; rotation of crops, disease-control measure, employment of power machinery and more intelligent use of fertilizers.

The government has compiled figures on the cost of feeding beef cattle in Missouri, Iowa and Indiana during the last two years. These statistics show that on the average the cattle growers in the sections covered would have made more money if they had sold their corn instead of feeding it.

The Middle West is being swept by the farm bureau movement. The result of the hundreds of organizers in Nebraska, Kansas and Iowa working with the county as a unit has been to sign up from 75 to 90 per cent of the farmers.

The report of Lloyd's Register of Shipping for the year 1920 shows that there is an unprecedentedly large tonnage of new vessels. The vessels of large size which were sunk during the war have not been replaced, the more urgent demand being for the building of cargo vessels. A great many steamers which previously burned coal were converted to oil burners.

There was a decrease of 60,000 in the number of men and boys working on Ohio farms during the fiscal year ending June 30. For every man who returned to farm life during that period, seven left it for other occupations.

The Department of Justice has petitioned the supreme court to be permitted to take possession and dispose of the stocks owned by the "Big Five" packers, in the enterprises which the meat men must abandon under the decree obtained by the government.

Before the war the United States manufactured toys to the value of $20,000,000 annually. This year the figure will reach the $100,000,000 mark, with a steadily increasing foreign demand.

A 14,000-ton tank steamer just completed at Emden, Germany, cost as much to build as did the gigantic 56,000-ton liner Imperator, constructed before the war.

Since the introduction of the new rail rates, Oregon and Washington mills have shipped half a million feet of lumber via the Panama Canal.

Legislation proposed by a bill just introduced in Congress would hold up all immigration for six months in order to give time to study conditions and frame new measures.

Capital is interesting itself in plans to utilize corncobs. Chemists have discovered that a high-grade adhesive can be obtained from the cobs in addition to practically pure cellulose.

The farmers of Canada are demanding a general lowering of the tariff on all articles required for cultivation of the soil.

Boys and girls of Idaho held their own fair this fall. They displayed 179 sheep, calves and pigs, most of them purebreds, over 800 exhibits of canned fruit and 350 samples of sewing. The exhibit was a feature of the general state fair.

Small sugar beet mills, according to government experts, have not proved successful in the United States. All mills slicing less than 500 tons a day have either failed or been enlarged.

Briefly Told

Eight billion dollars in various classes of credits have been extended by the United States to Europe in the reconstruction period since the armistice.

Doughboys of the American Army of Occupation on the Rhine consumed twenty-nine tons of turkey on Thanksgiving day.

The French Government has prepared a decree authorizing the mayors of all cities to prohibit use of fresh milk and cream in hotels, restaurants and similar places as a measure toward relieving the shortage of milk for children.

In the United States 27 acres are cultivated for each person engaged in agriculture.

A plant growing in the state of Michoacan, Mexico, affects the human organism in such a manner that the subject is made temporarily insane from breathing the perfume.

With the aim of improving her foreign trade balance, Italy is encouraging the use of peat instead of coal.

During the last fiscal year thirty-two persons in the army were sentenced to death by courts-martial, but in no case was the sentence carried into effect.

Idaho is preparing to take steps to provide against alien ownership of lands. The fear is expressed that Japanese will leave California and coast states and make their homes in Idaho, gaining possession of the land.

This year, for the first time in the history of the sessions of the Hawaiian territorial legislature, every member was able to understand English, enabling them to dispense with the interpreter.

Palmyra Island, 1,000 miles south of Honolulu, has no mosquitoes, no scorpions, no centipedes, and has plenty of fish in the surrounding water, thousands of birds, luxuriant vegetation and a cool climate.

Experiments conducted in the research laboratories of the army signal corps prove that a number of messages may be sent over submarine cables simultaneously through the use of alternating current.

Only five of the United States have no workmen's compensation laws.

The trunks of living trees may be utilized at times in the place of sending and receiving antennae for radio apparatus. This will be of great benefit to aerial forest fire patrol companies in time of fires.

Three St. Louis restaurant proprietors filed suit for $90,000 against four union labor organizations. The petitioners assert their business has fallen off because of the activity of pickets.

The number of unemployed in New South Wales is between 15,000 and 20,000.

Each member of the Osage Indian tribe who has inherited oil rights will receive $10,000 for the year 1920. There are now 2,228 original shares in the Osage tribe according to officers of Indian affairs.

Twenty-five thousand of the 50,000 babies born in France during 1919 have died, according to the census of the minister of labor.

To endeavor to bring about the passage of minimum wage laws Miss Jeannette Rankin, who was the first woman representative in Congress, is now making a tour of the country.

Maine reports an actual shortage of 108 teachers and 390 below the standard required which places the total shortage close to 500.

A bill drafted by a United States Senator would forbid all citizens who are abroad and members of the American diplomatic and consular services to drink intoxicating liquors.

Before they are two years old seven hundred and seventy-nine of every thousand babies in China die.

A Memphis man has invented a new cotton picker with a capacity of 700 pounds daily. The picker, at the end of a flexible tube, is placed against the boll and the cotton is drawn from the bolls by means of two cylindrical horsehair brushes which revolve. A suction arrangement draws the cotton to a receptacle in the rear.

During the last fiscal year the mints established a record in coinage, when a total of 809,500,000 coins were executed. This is an increase of 446 per cent in coinage over 1915, the last normal year.

Independent coal operators made an excessive profit from the people of New York City to the amount of $17,000,000 in the last year, according to the Massachusetts Fuel Administrator.

A 20 per cent mixture of barium carbonate with food makes a satisfactory rat poison, according to experiments conducted by the United States Department of Agriculture.

The business community of Germany believes that the German fleet betrayed the Fatherland and caused its ruin and consequently no German trader or shipowner will employ former naval officers, even those who served on warships in the battle of Jutland.

Six thousand persons from the United States are emigrating to Canada monthly.

Boot heels originated in Persia where they were originally attached to sandals to keep the wearer's feet above the burning sands.

Seventy thousand Sicilians awaiting an opportunity to sail for the United States are congesting the port of Palermo, Sicily. Ten thousand steerage passengers are sailing monthly from Naples for America.

The Russian census shows decreases in the population of more than ten per cent, compared with 1914, due to war losses and epidemics. Petrograd dropped 71 per cent, and Moscow 45 per cent.

The betting machines at the horse races in Berlin took in nearly 450,000,000 marks in the 113 days of racing this year.

Experiments in the Soviet hospitals of Russia have produced an anesthetic which can be used with practically no danger and the patient awakes from sleep without nausea or ill effects.

The decline of the beaver in Canada has resulted in the establishment of many beaver farms in that country from which the owners derive immense profits.

War Department expenditures for the fiscal year ending June 30, 1920, were $1,602,106,856.62.

A movement is on foot to preserve the sand dunes lining the Indiana shoreline of Lake Michigan. The Indiana legislature will be asked to appropriate $1,000,000 and an appeal for a similar sum from public subscription will be made.

Sickness results in an annual loss to the workers of the United States amounting to more than $800,000,000.

Kentuckians are planning to extract petroleum from shale found in abundance in that state.

The superintendent of immigration at Ottawa has issued instructions to agents throughout Canada to slow up immigration to that country. Steamship agents predict a heavy immigration throughout 1921 should industrial conditions in England fail to improve.

During the past year tobacco smokers paid in taxes $295,809,000.

Inventors in Riga have devised machinery for stamping nails out of the wire found on Eastern European battlefields and it is hoped this method will relieve the shortage of nails in the Balkan States. Also the piers at Riga are stacked high with wire suitable for nail making.

Two months ago the price for American coal at French ports was $29; now it is selling at $14 a ton. American coal can be imported 10 shillings a ton cheaper than English coal of corresponding qualities.

Workmen in the Erie railroad shops of Susquehanna have organized a movement to "take a week off" December 24 to January 2. This is voluntary on their part and is to help the company in its readjustment policy.

German residents and interests in Milwaukee have sent eighty million marks to Berlin to alleviate the distress in Germany and Austria. The practice of sending gifts to these countries was resumed when the war ended.

Many Men of Many Minds

Woodrow Wilson.—It is the young men of the country who must correct the reaction and pessimism of some of the older men and push forward toward a realization of the genuine ideals which cannot be lived up to without courage and a constant renewal of fidelity to the purest conceptions of democracy and of international responsibility.

Neil Burkinshaw.—Driven from their homes at the point of a gun for the crime of joining the union, more than four hundred miners and their families are camping in tents on the snow-covered mountains in Mingo County, West Virginia.

Major A. V. Dalrymple.—Politics has played a large part in the delay of the successful operation of the prohibition laws. It is impossible to blame any party of adherents of any political organization. It is just one of those natural results of putting into operation a law that is obnoxious to a large percentage of the population.

Ernest O. Thompson.—Even from the mere money-getting standpoint, a young man may be making a great mistake in rushing off to the city.

Don't Rush to City to Earn Money, This Man's Aavice

After all, what are the things that enable him to make money? Aren't they industry, integrity, character, and friends? He spends more than twenty of the best years of his life in acquiring them and in proving to the people of his home town that he has them. Then he goes to the city—and starts in all over again. It may take him years to prove to an entirely new set of people that he has these qualities.

Sir Oliver Lodge.—Do not let us despise and condemn the gropings of science, which are after all leading in the same general direction. Mistakes may be made, now, as mistakes have been made in the past, but on the whole psychic inquiry is proving itself a handmaid to the Christian religion; it is restoring comfort to many a darkened home, and bringing back to a reasonable faith many who else would have wandered into the deserts of atheism and despair.

William Whitman.—Nothing develops any human being quite so much as meeting every single obligation, real or implied, that he ever assumes. The present-day habit, known in slang as "passing the buck," is keeping thousands of men from success.

Senator Reed Smoot.—The time has come for a complete overhauling of our government machinery. This is not a partisan enterprise, designed to show that all the confusion and inefficiency displayed in Washington is due to the Democratic administration. It is a plan to make a workable business organization out of the government.

P. W. Litchfield.—The purpose of industry is to serve humanity. Often, however, in the course of production such things as unguarded machines, unhealthful working conditions, and careless workmen creep in, because what should be everybody's business becomes nobody's business.

William L. Chenery.—The world is beginning to feel the reaction from the war effort. Depression and unemployment are not limited to America. Paris, London, Central and Southern Europe, Canada, Japan—there, too, is deflation taking its toll. During the fat years we failed to take thought for the future.

Warren G. Harding.—I want to see our America one of the greatest, aye, the greatest maritime nation, on the face of the earth. I have a profound conviction that if we had had a great merchant marine as an auxiliary of national defense, our rights never would have been affronted by the Central Powers.

Raymond Mortimer.—The history of taste is entertaining enough; but it makes for skepticism. After years of neglect the architecture of Versailles has again won general admiration. Men appreciate the expression which it gives to the characteristics of the *grand siecle*, the untroubled order which springs from a monarchy, and the good taste which distinguishes an aristocracy; they admire its majesty, and find even its pompousness agreeable.

J. Madison Gathany.—No less an authority than the Secretary of Agriculture has recently made public that certain food interests, particularly the large food speculators, have at times attempted the suppression of the crop reports. The secretary holds, in substance, that speculation in food products depends and thrives upon lack of information, uncertainty, and confusion on the part of farmers and the public. Were it not for the crop reports, the public would be at the mercy of the speculators, who would be free to issue any sort of misleading reports designed to influence prices.

Dr. W. P. Goodsmith.—I can tell a "moonshine" victim the minute I lay eyes on him. They come to us raving crazy. A whisky drunk staggers, he is sodden, and quite often fairly good-natured. But a moonshine victim doesn't stagger. He spins around like a top. His eyes are closed or nearly blinded, and he often has complete or partial paralysis of the brain. He is vicious and wants to kill.

Catherine Breshkovskaya.—The course of events in Russia has convinced me that it is too much to expect the Russian peasant to learn everything at once. The hope of Russia, as indeed of all other countries, is in the children. The remainder of my life will be devoted to work for children.

Robert N. Miller.—One of the compensating advantages which has resulted to business from the Federal income tax law is that the law has induced taxpayers to keep books, and to keep them accurately and soundly, so that at the end of each year they can tell with certainty whether they have made a success or a failure and why.

Harriet Connor Brown.—The coming months are a time of opportunity for those opposed to the militarization of America, a time more favorable to the cause of disarmament than will come again soon unless we women use well our wits and power before next summer.

Floyd W. Parsons.—Practically all the leading nations of the earth pursue a policy of encouraging frontier development. Alaska is our richest and in fact is our only frontier that remains undeveloped. Though our government has had a freer hand in working out the problem of Alaska than it ever had in planning the future of any of our states, less has been accomplished in the development of our great Northland than was achieved in the settlement of all other parts of our country.

Clarence W. Barron.—What we need to insure the prosperity of the country are things of the spirit. It is not more coal or more water power or more horse power.

Need the Spirit of Cooperation to Help Country

We need the spirit of cooperation and this can be had only by recognition of the law of mutual service. The spirit typified by Prussia in its attempted world conquest is not entirely local to Germany. The spirit of conquest over the neighbor, the spirit to make others subservient to one's self, the spirit to do less and get more, belts the entire world. It cannot be eradicated in a minute; it is the "primal, eldest curse," and the cause of all the fall in man. It is just human selfishness.

John Barton Payne.—To place all Indians on a plane of business equality with the whites will take generations, and those good people who by legislation duly hasten this period and thrust the responsibility upon the Indian of dealing with the white man before he is able to do so are doing the Indian a serious injury.

Senator William S. Kenyon.—The farmers worked to win the war, they planted great crops and sold at government-fixed prices and they now find themselves facing a great economic crisis. Their products are selling at prices below the cost of production. The farmer is tired of this, and the balance of the country cannot afford to let the farmer face a situation in which he believes he has not had a square deal.

Ole Hanson.—European unrest will never quiet down until the people of Europe know that they must remain at home and go to work and produce. As long as they can be financed by Americans, or can sell their paltry belongings and obtain a passport and passage to this country, they will keep coming and will not settle down. In other words it is cheaper to move than pay rent.

Edwin E. Slosson.—America, having oil to burn, has shared it generously with her needy neighbors—at a generous price. She has fed the million lamps of China and India and filled the tanks of friendly fleets and rival traders. Soon she will, like a foolish virgin, be begging sister nations for the loan of a little oil.

Chauncey M. Depew.—The winds roar and the breakers break, but they do not disturb the Supreme Court, nor the Constitution, nor Uncle Joe Cannon.

Takashi Hara.—We cannot say that there has been no cause for misunderstanding as regards affairs with China in the past, but that was a question of the ability of the men in power at the time. It was not due to any of the traditional principles of Japan. That the result of the deals with China were not such as a section of Americans had understood them to be is a matter which has now been brought home clearly to the people of the world. Of that I am firmly convinced.

Dr. Charles A. Steinmetz.—Although we are absolutely dependent on our electricity today, we have still only begun to use it. In the city present methods of manufacture will be replaced with electrical methods. The present city with its dust and smoke will be unknown. It will be against the law to have a fire in the city limits. Life then will be worth living in the cities.

Electricity Will Improve Life In Cities, He Says

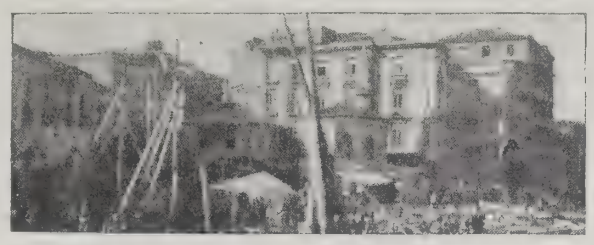
Theodore E. Burton.—Anyone who says that wages must be maintained at their present level is flying in the face of economic law. I do not say this from lack of regard for the working man. We are all anxious to pay the workers as much as possible. It is to our interest to do so. We are all workers in a true sense. But when they speak of war-time prices breaking and war-time pay remaining they are talking out of their heads.

Edwin T. Meredith.—It ought to be a fact that when the farms of the country produce abundantly, the consuming public will be liberally supplied with food at reasonable prices, the farmer taking his profit because of large production and the consumer receiving his increment of benefit from having an adequate supply at a reasonable cost.

Senator Thomas J. Walsh.—We are advised that the estimates for the army and navy of the United States for the current year amount to the almost inconceivable sum of $1,500,000,000. If there were no other reason, the condition of the world at this time, staggering under heavy burdens of taxation, would furnish a reason for a reduction of armaments, and therefore tax reductions.

Nance O'Neil.—I never find it an easy matter to write of the theater. It always seems to me like baring to the world one's innermost secrets; like something too sacred to sit down and discuss in cold pen and ink. I have the same love for it that a child has for its parents, and so I do not see its faults and failings; like the child I see only the good in it, and so can speak only with pride and affection.

Raymond Poincare.—The reverse suffered by the Venizelos régime in Greece is the most alarming symptom of reaction upon the mind of the world and the changed relations between the vanquished and the conqueror nations.



Hugh C. Cummings, surgeon general.—At present, officers of the public health service are stationed at practically all of the important ports of continental Europe for the purpose of investigation and to make preparation for the application of disease preventive measures at European ports of departure whenever there should be resumed trans-Atlantic travel.

Frederick A. Wallis.—I am told by persons of unquestioned authority from Europe that at least 8,000,000 emigrants are ready to come here from a certain country, as soon as peace is declared, and the way is made clear. From personal information, I am inclined to believe there are more like 15,000,000 clamoring to come to America.

The City of Unrest on the Golden Horn

By PAUL BOWERMAN

A VAST panorama of massive domes and slender minarets grouped on seven hills; a huge harbor filled with ocean liners, coasting steamers and clumsy sailboats, all crowded together in an inextricable confusion; a wide pontoon bridge spanning the Golden Horn between Stamboul and Galata, across which pours the concourse of nations from morning till night in two unceasing rivers of humanity; the whole spectacle veiled in a peculiar atmosphere that softens the glare of sunlight to a mysterious unreal glow—such is the splendor of Constantinople swinging around Seraglio Point from the Sea of Marmora.

The fish market and the public gallows, Stamboul.

But two other cities can boast of such a magnificent approach by sea—Naples nestling in an island-studded harbor in the shadow of Italian hills, and Lisbon rising in graceful terraces from Tagus Bay.

It is little wonder that the waves of conquering armies that have swept across the Bosphorus from Europe to Asia since the beginning of time have stopped to marvel here and to claim it as their own. It is little wonder that even now the age-old story is being repeated. It will be strange if it does not happen again in the years to come. Greeks, Turks, Romans, Crusaders, and now the Allied Powers—each has seen and recognized its glory, each has given its lifeblood to conquer it. Through all the vicissitudes of siege and bombardment and pillage, its matchless beauty has remained unspoiled and its fascination undiminished. It will always be so.

Yet all these have left their mark, have added something to the strange *mélange* that is the essence of the city. Nowhere can one see such a hopeless tangle of national feeling and prejudice, such a babel of strange tongues, such incongruities of architecture, dress and custom. The city takes them all in, erects a magic loom, and exhibits a cloth spun of many-colored threads in whose gloss and beauty can be seen the handiwork of a master-weaver.

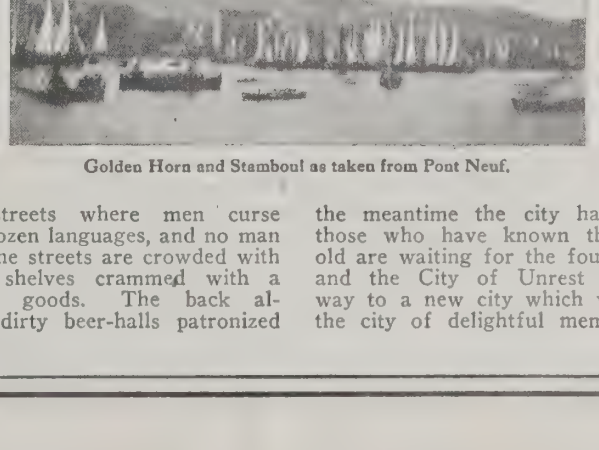
Grand Rue de Pera, the main thoroughfare of the European quarter.

Before the Great War Constantinople was a delightful place to live in. The grandeur of its setting, the charm of its mosques and temples, the quiet restfulness of the pretty villages clustering the shores of the Bosphorus, the fascinating mixtures of the Occident and the Orient, endeared it to the hearts of Turks and Europeans alike. There were delightful parks to spend a lazy afternoon in the shade of great sycamores and planes. There were charming little restaurants where one could spend a pleasant half hour over a tiny cup of Turkish coffee and Oriental dainties. There were theaters where one could see the best in drama and opera. The famous bazaars were a gorgeous profusion of delicate artistry and skillful manufacture. Life was a bit easy-going, colorful, and infinitely varied.

On the Boulevard Ayas Pacha that descends from Taxim to the gorgeous palace of Dolma Bagtche rises an imposing structure of white marble. It has been said, and not unreasonably, that the intrigues that led to the Great War were planned within the walls of that building, the German Embassy. It stands a grim and lonely landmark, a specter that haunts the diplomatic circles even now. Today it matters little whether the plots were hatched on the Boulevard Ayas Pacha or in Potsdam. The effect on Constantinople is the same, and it is that change which makes it today at once the most interesting, the most pitiable, and the most potential of cities.

Outwardly there has been little change. There is still that breathless moment coming round Seraglio Point, the mosque of Sultan Ahmed still lifts its six minarets and gleaming dome into the sky, and the Pont Neuf is still a river of men. The Grand Bazaar is still a-hum with the drone of bargainers and redolent of the spices of the East. Camels and sheep and goats still transform the crooked narrow streets of old Stamboul into a page from the Arabian Nights. The framework is as of old, unchanging as the marble walls of Santa Sophia. It is the human element in the vast tableau which makes the Constantinople of today so different.

The war brought many new people. While the British were making their gallant but hopeless attack on the Dardanelles, the Germans and Austrians sifted in, and with characteristic thoroughness left their mark on everything they touched. While their officers were commanding the Turkish troops, their scientists and archeologists were studying the ruins of antiquity, rehabilitating the museums, and tabulating statistics. In the ruins of Roumeli Hissar, an ancient tower erected in the fifteenth century by the Turks who were storming the city, one can see the tools abandoned by the German workmen in a hasty retreat.

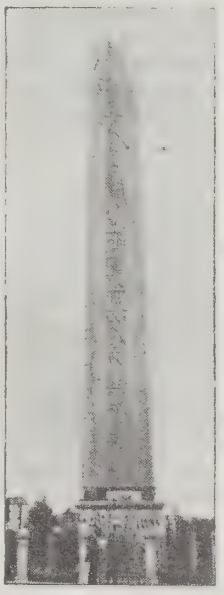


In the days that followed the signing of the armistice, when the Allied Powers took over the city, refugees poured into the city. Thousands of Russians fleeing from Soviet rule came in boatloads from Odessa. At the present writing 40 boats of them, driven from the Crimea by the advance of the Bolshevist armies, are anchored in the harbor waiting to come ashore. American transports brought thousands of starving Armenians to be helped by the Near East Relief. The Turkish Nationalists drove whole colonies of Greeks from their homes in Asia Minor, and these found their way to Constantinople. Most of them, friendless, destitute, and starving, are left to shift for themselves. They were scattered and swallowed up. What has become of many of them will ever be a matter of unpleasant conjecture.

But whatever lure Constantinople may have had to these homeless people fleeing the persecution of tyranny, it also held forth innumerable attractions to those whom the war had made suddenly rich, for profiteering in the Levant was as lucrative as in America. Oil kings from Batum and Trebizond, Greek merchants from Thrace and Cilicia, *ci-devant* nobles from Russia flocked here to spend their wealth. With these came the usual harpies—professional globe trotters, shady "gentlemen of adventure," painted women, and all of the stock characters of a musical comedy.

Stamboul alone seems to resist the invaders. It is still very quiet over there, very much as it has been for a decade, and the traveler cannot but admire the impenetrable seclusion and the indifference to externals which is so innate in the Stamboul Turk. Governments may totter and fall, wars may come and go, but the Turk never once forgets the wonder of Islam and the unimportance of the present in the light of the glories to come. And so he goes about the pleasant routine of his daily life, courteous, affable and neighborly.

It is in Galata and Pera that the unrest is so manifest, and it is in these quarters that the wealth and power of the city is concentrated. The Pont Neuf spans a body of water that separates more than simply two quarters of a huge city. It links together two worlds so utterly incongruous that the five minutes spent in crossing brings a change that seems incredible after countless repetition. Stamboul is a city of the Orient, with its tiny shops where the men sit cross-legged before a cup of coffee, puffing narghiles, and lending their voices to the drone of sleepy conversation. Here the creaking tramcar seems a sacrilege, and an automobile still scatters the frightened veiled women to the security of some protecting doorway.



Galata is a bedlam of shrieking vendors, noisy carts, reckless motor trucks, whining beggars and insolent soldiers. Life is dangerously near the breaking point of excited passion. Law and order are unknown in the swarming streets where men curse their neighbors in a dozen languages, and no man trusts his brother. The streets are crowded with tawdry shops with shelves crammed with a potage of imitation goods. The back alleys are alive with dirty beer-halls patronized by a motley assembly of hybrids, neither Turk nor Christian, who prey upon each other and the unwary passer-by. Just off the Grand Rue de Galata on the intersecting side streets, the most outrageous display of vice to be found anywhere in the world flaunts itself in disgusting brazenness.

Golden Horn and Stamboul as taken from Pont Neuf.

Over the whole of it hangs a fog of hopelessness which is the outgrowth and penalty of its own depravity. Nothing good could ever evolve from the mismare of covetousness, dishonesty, crime, and immorality. It will have to be swept away like a diseased spot.

The ascent from Galata to Pera is made by the famous Step-Street, a succession of broad cobbled steps, on which a thousand portable shops perch precariously, and which terminates in the Grand Rue de Pera, the main thoroughfare of the European quarter, a section altogether different from Galata with its blatant wickedness, and Stamboul with its elusive charm. The broad, well-paved avenue is full of attractive stores, the sidewalks are thronged with well-dressed people, and handsome equipages line the curb. It has the outward appearance of a prosperous European city, an isolated rampart of Occidental culture and civilization in the stronghold of Mohammed. Of all the polyglot of refugees who have come to Constantinople, the best have found their way to Pera, and the worst have sunk themselves in the pool at the bottom of the hill. They have made a brave fight for existence, and a worthwhile struggle to maintain the standards they knew before the war. Some have succeeded and are even now prospering. Russian nobles have capitalized their refinement as proprietors of tasteful bazaars, and Russian artists are giving symphonies at the theaters. But there was not opportunity for all, and the others have drifted into a careless lethargy, which will lead them eventually down symbolic Step-Street to Galata. And there are yet others who came not to earn, but to spend. The result is a cleverly concealed and super-refined Galata, perhaps more insidious for its disarming veneer of stability.

Obelisk of Theodosius I dated 1440 B. C., brought to Stamboul from Egypt.

The night life of Pera is centered in a succession of glittering restaurants—French, Greek, and Russian—to which resort the spenders and the satellites who seek to share their wealth. Their senses numbed by the horrors of the war, their indifference to the future encouraged by their day-to-day existence, they crave the excitement of artificial pleasure. They pay fabulous prices for food and drink without questioning, knowing that the end is inevitable. The Russian cafes are dazzling pictures of ornate decoration, beautiful gowns and lavish entertainment. Orchestras such as one could not find outside of Russia play the airs that these same people have heard in Moscow and Odessa. Strikingly beautiful girls serve in the double capacity of waitress and entertainer, sharing the bottle of champagne over a cigaret, and chatting with the unattended guests.

Outside, the streets are ablaze with enticing lights and crowded with merrymakers intent upon living at the highest pitch till the fight is over. Beneath the white shirt-fronts of the men and the luxurious gowns of the women, is the identical abyss of passion and greed and crime that lies so near the surface in Galata.

How long this dazzling superstructure can stand is impossible to conjecture. Wealth seems to pour into the city from a thousand unseen sources, regardless of the famine and desolation that knock at the city gates. Strangers come and revel in a city where revelry is the chief aim of existence, and then disappear to make way for others. In the meantime the city has lost its soul, and those who have known the Constantinople of old are waiting for the foundations to give way and the City of Unrest to disappear, giving way to a new city which will in part resemble the city of delightful memory.

"Charity" and "Institutions"

THE New York police recently voted down a proposition to establish a Police Hospital. The proposal apparently originated with politicians who were anxious to get another institution with another block of jobs under their control, and they conceived the idea of putting it through on the basis of the approval of the uniformed man on the beat. To insure this approval, they arranged that the policemen's votes should be made verbally before the captain at each precinct station house. Under this method the hospital was unanimously approved—it apparently having been intimated to the policemen that the "higher ups" wanted it. But afterward a secret vote was taken, where each patrolman could express his private conviction without coercion or fear, and this vote was heavily against the hospital plan.

It is an excellent sign. There are too many groups making a business of charity, and the people are getting tired of it. Enough is taken from the general public in money every year to go far toward balancing the inequalities of the present system, if it were applied to inequalities instead of the continuance of an undesirable condition.

There is an element in commercialized charity which debases both him who gives and him who receives. The great argument of many of our "drives" is this: "If you give once this year, we will not bother you for twelve months with the misery and want of the world." And that is wrong. If there is misery and want in the world, those who are able to prevent and abolish it—if there are any such—ought to see so much of it that they will do their full duty toward it, and not compromise with their duty by giving a contribution.

It is right and proper that immediate and urgent need should be met, but that is not enough; the cause of the need should be probed; and no man has made his contribution to true charity who has not gone deeper than his own pocket. Human fellowship, true sympathy, honest charity which is akin to justice, has a higher field of action than the debasing of a needy human being by rendering him the recipient of another's alms.

Then there is the question of the energy which is misused in these enterprises. The tremendous pressure of enthusiasm and effort which any "drive," local or national, can command and consume would, if directed toward objects of permanent achievement, go a long way toward putting many things right. It is really astounding how much energy and enthusiasm can be put into the work of giving poor people a dinner on a festival day, and how little interest could be roused among the same philanthropists in the less picturesque but more useful work of arranging matters so that everybody could get his own dinner every day.

"Charitable institutions," so-called, are not charitable; they are paid for just as actually as any other institution is; the only difference being that the "charitable institutions" are paid for by people who do not use them, while the non-"charitable" institutions are paid for by those who do use them, and as a consequence the latter are far more efficient, far more serviceable to society than the others. There are "charitable institutions" which serve no other purpose than to give light minds the comfortable feeling that "something is being done"; they are mere internment places for people whose plight spoils the view for sensitive people. It would be really charitable to abolish some of the "charitable institutions" now in existence, and place their inmates in the homes of the people.

It is not only the money that matters, it is the energy, the false beliefs, the half-way methods that constitute the pitiable insufficiency of what some people try to do. We need an entirely new, a radically changed attitude toward charity, which at first may even appear to be coldly inhuman, but in the end it would justify itself by the permanent benefits which through it would accrue to human beings.

The Need for Salesmanship

THERE was a time when one of this country's proudest boasts was its salesmanship. We studied it, developed it and made it an art, for the successful practice of which no effort was too great. Then came the war and salesmanship went into a decline.

War's demands and the money which war put into circulation made the selling of goods so easy that salesmen became mere order takers. As demands grew and the supply lessened it was no longer necessary even to go out and take orders. Men sat in their offices and the orders rolled in so heavily that buyers, in many cases, had to beg consideration of their needs and took it as a personal favor if they got it.

There is no condition so much relished by business as a rising market and for months the market in this country rose daily. Anything went and at any price. Apparently there was no limit to the buying public's desires or its ability to pay.

And then, more suddenly even than it had risen, the wave of buying receded; the period of readjustment began. The thing which many salesmen had assured themselves could not happen did happen—prices began to slump.

That should have been the signal for the revival of the art of salesmanship. That was the time to get out into the market again, to study the situation and to adopt new policies to meet it. But did this happen? The answer will be found in a score of industries, and the answer is "No"!

Instead of digging out of his office to build up new business, the salesman has dug himself in and hung crape on the door. He has taken the attitude that because business no longer comes to him there is no business; that because the public is not buying it cannot be persuaded to buy. All of which is simple nonsense.

The way to get business is to make business. The way to revive buying is to revive selling. And the time to do it is now. Not January 1! Not next spring! Not next summer, but now!

The United States is neither dead nor defunct. It is functioning normally and it has a huge share of the world's gold with which to do business. But the workman cannot labor and the manufacturer cannot produce until the salesman begins to sell goods.

It cannot always be harvest time. There must always come a day when the crops are in and the profits counted. And when that day comes the only way to assure another crop is to get to work and cultivate one.

Homes—Rural and Urban

DWELLERS in rural America who are inclined to envy their brothers in the cities the joy of living in a four-room flat, or in a story and a half house on a 35-foot lot, will do well to consider for a moment the plight of the folks in Jeffersontown, Kentucky.

After writing municipal history for 126 years, during which it experienced good, bad and indifferent administrations, Jeffersontown has decided that the bad and the indifferent outweigh the good by such a large margin that there is no use living under such conditions any longer. Therefore the citizens have been petitioned for permission to give up their charter and abandon city government.

There is a good deal of common sense in the rebellion of Jeffersontown. Municipal government is an expensive luxury. And it grows more and more expensive so that what may be called its marginal utility is being wiped out. In other words, the city dweller has to pay more for living in cities than the privilege or luxury—call it what you will—is worth.

Naturally it is not possible nor desirable for all cities to follow the example of Jeffersontown. We need and shall continue to have cities. But we need not continue to overvalue them as places of residence. We should be willing, very soon, to acknowledge the fact that from the standpoint of the home-seeker and the home-builder the city is going back and the country is coming forward. One can now live in the country and yet enjoy all the conveniences of urban life—*minus* the taxes and *plus* the country.

Cross-Currents

IT WAS the people of Holland who first adopted the rooster as a medium for the weather vane, soon to be followed by England, because of the incident in which the cock figured when the Apostle Peter denied his Lord.

"As changeable as a weathercock," is an old adage, which illustrates the swinging of the vane. But because the vane may point to all four points of the compass in as many minutes, does not mean that the wind has changed that many times from its original quarter.

A man raking up the leaves on a lawn rakes with the wind. He has the leaves piled up and the wind is blowing steadily from the North. Then there is a sudden gust from the South, a cross-current, a whirling eddy, and the leaves are blown back over the lawn. But the man does not begin to rake toward the North, for the wind is still in that quarter. He knows that the gust which drove the leaves back was merely a caprice of the breeze, and so he still rakes them again with the wind. It is only one of those happenings which occur in the day's work, and which can be repaired by patient labor.

In the cross-currents of life the same thing holds true. A man who has always lived a good, upright life may, in a moment of moral or physical weakness, give way to a sudden temptation. A cross-current has struck him and, for a time, faces him in the opposite direction to that in which he has been traveling. He may have thought too highly of his own ability to resist temptation. He may not have guarded his weak point as he should. He may have been in a boastful frame of mind, which always precedes a fall. But even though he fell, he should not be regarded as a degenerate man. The damage can be repaired, although it will take time and patience and suffering.

Many people are apt to say, when a man or woman, who up to that time has lived an exemplary life, makes a misstep, "Now we see him in his true character; all that has gone before was but a masquerade."

Oh for a little of that charity which was extended to Peter when, for a moment, he was swerved by a cross-current! Why try to tear down and destroy a reputation which has been built up by years of right living? How much better it is to have sympathy for the one who has been caught in the cross-current amid the winds of life, and help him to steer straight again.

Aviators will tell you that after climbing to a great height and then flying with the wind, they will suddenly encounter a cross-current of air, which causes them to go tumbling from their course, sometimes to their destruction. If they can recover their equilibrium, they turn about and begin the long, laborious climb to reach their former height again.

If you have climbed to a height of moral attainment, if for years you have been a respected member of the community, if your face has always been set toward the sun, and you have been caught in a cross-current, faced about the other way, crushed to the earth, perhaps, and are sick and bleeding, don't despair.

It was probably your own fault that you fell, and you deserved the punishment that your act has caused you, but by your own efforts you can rise again to the heights you once attained. Yes, and you can go to sublimer heights, if you so will it. It will take time, the road will be full of discouragements and temptations to give up the fight, but you will win again if you will only press on.

"One ship goes east, another west,
By the selfsame winds that blow;
'Tis the set of the sail, and not the gale
That determines the way they go.
Like the winds of the sea are the ways of fate,
As we voyage along through life,
'Tis the set of the soul that decides the goal
And not the calm, or the strife."

Has a Story to Tell

AMONG the new figures in Congress is Daniel Sutherland, who comes to Washington with a message which may well attract the attention of this nation. It is a story of the grievous oppression of a people. It is filled with tales of shocking injustice, of bureaucratic stupidity and of downright governmental dishonesty. It tells of the processes employed in an effort to stunt and stifle and finally wipe out a brave and hardy people by depriving them of their means of livelihood.

It is a story which should attract instant attention in a country which professes to be exceedingly interested in the rights of small countries—since it is the story of our own abuse, mismanagement and robbery of the people of Alaska.

Mr. Ford's Page

THE power of minorities to affect the life of majorities has many modern illustrations, especially on the side of evil. It seems rather a strange thing to say that evil minorities come into influence more speedily than do good minorities. A genuine reform takes a long time to accomplish, but an evil influence seems to run its course like wildfire. This is not to be wondered at, since evil like a rank weed comes to maturity quickly, and thus hastens its end, whereas a form of good, being of sturdier growth and having a longer future before it, requires a longer time to ripen. The whole fact is full of hopefulness. When we see a wrong thing coming into full flower, we may be certain that its end is near.

An illustration of the power of minorities to affect the life of the people is to be found in the banditry which has grown up in many of our large cities. Now, bandits are so few as to be hardly worthy to be dignified by the name "minority"; they are an infinitesimal fraction, measured by the mass of the population.

And yet, every city where one or two or three bandits have operated nightly is more or less influenced in its thought and action by the fact that these few lawless ones exist.

This is very noticeable among the motorist population. There was a time when the helpful hand was the rule of the road. If a car was in trouble in a lonely place, passing drivers would stop to inquire if they could help—they might have the special tool, or the knowledge, or the extra gallon of gas which would help the stalled car out.

That has all passed, not because of the drying up of the springs of human kindness, but because a few men have been held up when they have stopped under the impression that a motor party was in trouble. Nobody is taking any chances now.

Not long ago a man ran out of gas on a country road at midnight. A dozen cars passed, and the man hailed them for a lift to a telephone or a gas station. As soon as a driver would spot him waving his hands in the roadway, the speed was put on and he was passed with a rush. It happened in this instance that most of the drivers who passed the hailing figure were his own neighbors. But human trustfulness had been driven out of them by a caution inspired by the fact that road bandits had used precisely that kind of lure.

There is no blame attaching to a circumstance like that—except to the carelessness of the man who failed to fill his gas tank. But it is a homely and true illustration of the effect which minorities have on us, especially with reference to possible evil. It illustrates also the effect on social relations which the existence of a small but active evil influence can have. Take the midnight instance on the road: collect every driver within twenty miles of that spot, and you would probably find as normal and decent a group as could be assembled anywhere. But out there on the road, it was all different—because they knew what *might* be done.

This is a situation which exists under a number of different forms, and there are two reactions to it.

One type of mind reacts to it in this way: Trust everybody, and if you are "stung," charge it up to experience. It is better to be mistaken trusting everybody than to do injustice by distrusting everybody.

This type doubtless adopts that policy for its own comfort. Chronic distrustfulness is an unpleasant condition to support. The most determinedly distrustful man finds himself slipping back into normal social trustfulness occasionally, and it is the irony of circumstance that often he slips back just in time to bestow his trust where it is betrayed. It is more comfortable to accept people as they come, trusting that the majority will be on the square, and some people adopt that course as their policy.

THE greatest adverse power which the evil minority in human society exercises upon it, is the weakening of the sentiment of human confidence. When men begin to lose confidence in each other, society loosens and falls apart, like a wall in which the mortar has lost its cohesive power. All of the people sense this. One type senses it from the protective side and adopts an attitude of protective distrustfulness. Another type seeks to protect itself by preserving its mental comfort which it does by adopting an attitude of general trustfulness. Both of these are mere policies determined by temperament. They are individual reactions. They do not go to the root of the trouble, though they may serve to tide the individual over the condition made by the trouble. The building up of human confidence is the normal action of society.

The other type has been alluded to and need not be further described. While it is true that in the higher relations of business there can be no achievement without mutual confidence, it is also true that business tends more and more toward the attitude of taking no chances. "Business is business" is a true saying, which means that there is a way of doing business which makes it secure from the consequences of any lapses of character, and that is the method of doing it on strictly impersonal terms.

The point seems to be here: the type that adopts a policy of trustfulness in order to secure its own mental comfort, as well as the type which adopts a policy of consistent distrustfulness in order to prevent deception or loss, contributes nothing to the main problem, which is the existence in the world of a minority which has power to embarrass and fracture and weaken human relations to such a point where the adoption of one or the other of these policies becomes almost a necessity.

Human confidence is the fundamental essential to all social achievement, and the lack of it is the one condition which makes social breakdown possible. Take every one of the socially disruptive doctrines and movements which are operative today, and you will find that their whole object is the destruction of confidence between man and man. They are taking the mortar out of the walls that compose the house of humanity, in the hope that when a strong gale blows, the house will topple into ruins—and then those men who covet what others have earned will swarm forth and take it.

It is curious that in Russia the working man suffered most. What he earned was "commandeered" and men who did not earn it were given it to enjoy. The nonworkers have about eaten up what the workers had produced, and the end, of course, is near. Men may pretend to covet the heaps of gold that represent the working "capital" of a nation. But heaps of gold are nothing; what they really steal is what the workingmen, the producers at both ends of the industrial system, have made. *Because*. that is the only stuff worth stealing.

It used to be that the divisionists, the destroyers of human confidence, divided society into "labor" and "capital," and sought to pit them against one another. But that did not destroy the basis of human confidence quickly enough. So they invented a third class which they endeavored to slip in as a wedge between "labor" and "capital"—they invented the "middle class."

The "middle class" has been made to appear as a "buffer state" which "capital" has reared between itself and "labor." The clerks, the bookkeepers, the doctors, the teachers, the small business men—in short that group of men who are the servants of the producers, waiting on them while they work, and serving them in supplying their homes and doing their work in city affairs—all these useful people have been exalted into the sinister dignity of being a "buffer state" behind which "capital" hides from the force of "labor."

It is rather ridiculous; but it was very serious in Russia. The "proletariat" killed these people because—because—they—wore—white—collars! People who worked in the factories and whose work was clean, had to hide their clean clothes in order to save their lives. To be dirty meant to be "one of the people."

You see to what lengths this distrust of each other can go, and to what social insanity it can lead. It is just as essential that we should banish these divisive and destructive things from society at large as that a city should drive bandits out, in order that citizens may be able to pass one another on the streets at night without regarding each other as potential bandits.

The Case of the Farmer—As the Farmer Sees It

Motives Behind the Great Surge Toward Organization and Reasons for the Demand for Special Legislation

The American farm leaders contend that present conditions threaten the stability of agriculture.

They say that the farmer has been discriminated against; that he is so curbed and hampered that he cannot make a fair profit on his labor and his investment, and that in many cases he actually loses money on his year's work.

No attempt has been made here to debate these arguments. They are set forth as offered by the representatives of farm organizations.

They will serve to explain to the reader the great surge toward union and co-operation among the farmers and insistence upon amendments to the anti-trust measures which will make it lawful to engage in collective marketing.

ABOUT half the people of the United States live in what the Census Bureau designates as "rural" America. This half of the population—48.1 per cent to be exact—feels that it has a grievance against the way it is being treated. It does not believe it is getting a fair deal from the 51.9 per cent of the people who live in "urban" America.

Now, when half a nation feels it is being wronged some attention must be paid to the complaint. There must be a hearing sooner or later and the more willingly it is given and the more sympathetically it is received, the better matters will be for everyone concerned.

"Rural" America, let it be understood, comprises the people of the farms and of the hamlets and villages of less than 2,500 population. Actually, of course, those who live in the communities are not all tillers of the soil. But they live so close to the farms and their lives are so constantly interwoven with the lives of the farming class that their interests are practically identical and they may be written down as accepting the farmer's viewpoint and making common cause with him.

In two articles THE DEARBORN INDEPENDENT has described the growth of the co-operative movement among the farmers of America and the national legislative program which their organizations propose to place before Congress. In this article an effort will be made to set forth the reasons which the farmer advances in support of the course he purposes to pursue. Before continuing, however, it should be understood that no attempt is to be made here to debate these arguments. Whether right or wrong they represent the farmer's viewpoint and it is as such and such only that they are set forth.

Let one of the most general complaints be heard first.

The farmer charges that the present anti-trust laws make it impossible for him to engage in collective marketing and that such marketing is not only necessary, but is absolutely essential if he is to share in the nation's prosperity. Collective marketing, he declares, will permit him to have something to say about the price he is to receive for his products and his labor and this right he feels he must have before he can even begin to solve his present-day problems.

"When we purchase goods" complains the farmer, "we are told how much we must pay. When we sell, and somebody else purchases, we are told how little we can get. What would the hardware merchant who puts in a line of stoves think if we were to walk into his store and without waiting to consider what the stoves cost him, or how much he must add for his labor and the cost of doing business, tell him what he had to sell them for? Yet when we are ready to sell our products that is exactly what happens to us.

"Other lines of business base their quotations on the cost of production plus a supposedly fair profit, all influenced somewhat by competition, but nobody cares what the farmer's cost of production has been nor whether he is getting anything for his investment, his time or his labor.

"We are urged to plant a big acreage so that the world may be fed and then when the work is done and we are ready to market our crops, we are told that there has been overproduction somewhere, that the supply is greater than the demand and consequently we must accept a lower price than had been anticipated.

"Now the chances are that when we prepared for our crops prices were high. Labor was expensive, implements, fertilizer, seeds and everything we use were on a similar scale. This means that our costs of production were high so that when we went to market to make our annual turnover and were faced by low prices for our products we were somewhat in the position of the merchant whose shelves were filled with high-priced goods when the cost of living fell. But the merchant has had an opportunity to get from under, and we have none. He turns over a share of his stock every day. He can prepare for such an emergency. We turn our products over once a year. Prices may start to drop months before the harvest time and we are perfectly helpless to protect ourselves. We cannot hurry our crops or change them, once they are in the ground.

"Business and industry in general are endeavoring to step down gradually so that they may preserve their equilibrium and save a crash, and the farmer does not object to that. What he does object to is the fact that there are no steps for him. He is pitched down bodily.

"When we do go to market," the farmer argues, "it is as individuals. We have no particular influence, we cannot dictate any terms. In the great majority of cases the farmer has not the means to carry his products until prices rise. He cannot borrow heavily from the banks for that purpose. Therefore, he has no alternative except to take what is offered him. On the other hand a co-operative organization which controls 40 million or 50 million bushels of wheat will have had the means to study the markets, to decide when to sell and will be able to carry its members for a time while waiting for a more favorable market."

Frankly stated then, the farmer wants the anti-trust laws amended so that he may be able to steady the price of farm products through collective bargaining. He would rather have steady prices than high prices and he believes he can bring them about through organization. That is why he is going into these co-operative movements so strongly; not because he believes they will give him pleasure, nor because he thinks they will increase his social standing. He supports them because he thinks that through them he can increase his prosperity and, like everyone else, he measures his prosperity in terms of money.

A second complaint which the farmer makes has to do with the present system of distribution. He claims it operates to his great disadvantage and robs him of a fair profit without, on the other hand, benefiting the public through low prices.

"There was a time," says the farmer, "when the chain consisted of three links: the farmer—the retailer —the consumer. Now dozens of speculators, buyers and brokers have crowded in, each of whom demands a profit and who gets it, no matter how much prices may drop, by whipsawing the producer and the consumer—one out of his just profit and the other out of a fair price.

"It is easy and natural for the city people to cry, "Down with the farmer's profits," but experience should have taught them by this time that low prices to the farmer do not mean correspondingly low prices to the consumer. The bottom fell out of the hog market last year and many farmers went bankrupt as a result, but the price of bacon advanced 11 per cent. The price of beef went to smash and hundreds of stock raisers went with it, but the butcher kept right on charging the same old price for steak. He said it would be some time before the cheap meat would reach his counter. Yet he buys the meat every day from the packers who kill and ship every day. The wool market collapsed long ago but the price of wool cloth is still high. There is practically no market for cotton, but cotton goods bring good prices. Leather has taken a tremendous drop. But the farmer who takes a calf to market and then goes in to buy a pair of shoes pays more for the shoes than he gets for the whole calf.

"We understand that the bakers have finally condescended to drop the price of bread one or two cents a loaf. That brings up the question of wheat. To begin with, the grower feels that he was badly treated during the war when the government fixed the price of wheat at $2.20 a bushel but left all other industries free to operate on a cost-plus basis. He wants to know why he, out of all the producers in the United States, had to submit to an arbitrary price which was not even based on the cost of production. He points to the statement of a high official of the Department of Agriculture who said that the average cost of producing a bushel of wheat in those years was $2.27 and he recalls, besides this, the fact that the government price of $2.20 was merely for top grade delivered at a terminal point, and that the average in reality ran about $1.90. Early this year, when the wheat had left the farmer's control and was in the possession of the speculators, the price went up. When he was ready to harvest his crop it went down again.

"Who is responsible for these conditions? Why, the go-betweens, the profit-takers who have entered the line of distribution. As they pass the food along each adds something for handling so that the price grows like a rolling snowball. Let the farmer engage in co-operative marketing, permit him to build organizations strong enough to push these men aside and deliver direct, and he will not only obtain fair profits for himself, but he will guarantee a reduction in prices to the consumer."

This brings us to another complaint the farmer is making, which is that he is unjustly regarded by the nation as a greedy member of society who is intent only on grasping all he can get and who is never satisfied with his profits. He claims in reply, that not only did he get less than his share of prosperity during the war and the two years following the war, but that he is expected to operate at a loss during the period of readjustment.

"Turn," says the farmer, "to the reports of the Department of Agriculture and find written there the statement that the average wage of the American farmer is less than half the average wage received by carpenters, bricklayers or other skilled city workmen who are members of trade unions.

"Turn also to the last annual report of the Secretary of Agriculture and you will find this statement: 'In some sections the net return on the purchase price of farm lands is considerably less than the ordinary rate of return on first mortgages and similar investments. The rental rate of cash leases, also, is frequently less than half the rate of return on mortgages . . . . Such a situation is unfortunate, for it increases the difficulties of a tenant who is seeking to become an owner If he borrows a considerable part of the purchase price of a farm at from five to seven per cent and then finds that the investment will earn little more than three per cent, it will be impossible in many cases for him to discharge the debt.'

"Read now the brief remarks which the Secretary of Agriculture makes on the subject of the reduction of the area under cultivation in the United States. They follow:

" 'War conditions stimulated an expansion of the area devoted to crops, estimated at 10.1 per cent from 1914 to 1918, or an increase of 3.4 per cent in the per capita acreage. This was effected by utilizing pasture land for crop production and by bringing into use other uncultivated areas. The expansion was particularly marked in the case of small grains. Since the armistice there has been a reduction in crop acreage. From 1919 to 1920 there was a decline of 5.4 per cent in the acreage of 20 principal crops. Apparently the reduction has been brought about by returning the land to pastures and by discontinuing the use of low-grade areas which were temporarily utilized.

"These changes should be instructive to those who would reduce the price of farm products by bringing into use large areas of new land. *It is clear that if prices have been extraordinarily remunerative to the farmer compared with the returns on capital and labor in industry, we would not witness this reduction of the acreage in cultivation, but on the contrary a continued enlargement of it.*

"Much loose thinking and many wrong conclusions are based on false impressions concerning the profitableness of farming. The increase in farm profits during the war was inevitably transitory. Moreover, measured in purchasing power, they shrank rapidly as a result of the rise in general commodity prices. Owing to the highly competitive character of his business and the lack of organization, the farmer has had no effective means of preventing the impairment of his profits; his only recourse has been to migrate to the city and change his occupation, a course actually followed by many. In the light of these facts and the fear of a continued decline in profits, it is clear why the tendency to expand the crop area has been suddenly reversed."

As a clinching proof of his contention that he is faring badly, the farmer offers government statistics on the 1920 yield and invites comparison with the harvests

WE HEAR A LOT ABOUT LOW PRICES FROM FRIENDS. —*Indianapolis News*

A Little Village Solves a Big Disease Problem

By FRED L. HOLMES

THE little village of Shorewood, north of Milwaukee, has pointed the way to the solution of one of the biggest public health problems—preventing the spread of contagious diseases.

It has applied no new remedy. It has discovered nothing unique in handling diseases. It has enforced known rules of disease control so rigidly that results of startling significance in community welfare work have been obtained. There is not a community in the nation but should be able to duplicate these results by following this method.

There are things strikingly singular about the Shorewood method of curbing menacing epidemics. Perhaps the most significant fact about it all is that this health officer is not a physician. He is a plain layman, principal of the continuation school in Shorewood. He has had no particular training for the job. It is a case of added duties that are sometimes forced upon a public official from which there is no escape. Once the job was handed to this pedagogue he seems to have thought the community meant business in checking the preventable diseases that every winter went racing from one family to another—whooping cough, influenza, measles, scarlet fever. At least he meant business when he took the job.

Shorewood's health lesson can be better explained by a little information about the village, its community life and surroundings. Shorewood is a fashionable bungalow village north of Milwaukee. It is bisected by a long cement street, which connects the suburb with the busy metropolis at its south. So close is it to Milwaukee that its working population is nearly all employed there and there its people do most of their shopping. It is robbed of all the elements that go to make up a distinctly community life. It has few stores and only two small churches. It has public schools, but no high school, sending its older children into the city for further training. It has a changing population and during the past two years every third house changed hands. It is like the covey of prairie chickens that scatter in the morning and return again at dusk. Contrasted in nearly every social element it is the opposite of other remote communities, "snug and secure in their isolation." Every day hundreds from Shorewood go back and forth from commercial counter and workship to home—possible carriers of any new disease where they visit. Perhaps it has more than ten times the daily exodus and influx of population as any ordinary village of its size.

Living in Shorewood is the continuation school's principal, W. C. Sieker. He was one of the town's kickers against the invasion of new diseases from the outside world. When an epidemic of whooping cough swept the village three years ago he voluntarily quarantined his own family and they escaped. Right there is the secret of Sherwood's disease extermination. There can be no flourishing of a communicable disease without victims and Shorewood has locked its doors and refused to supply them. It is a stern, unflinching policy but it works.

The position of health officer in a village is not usually a salaried one in Wisconsin. It it were, more men would seek the job. As it is everyone shuns it. Perhaps it is the limited salary that makes the Shorewood health officer so determined in enforcing health rules. He is an autocrat. If they don't like his rule it is for them to find another to do the work. Anyway, following one of these annual epidemics Shorewood elected one of its health cranks to the job and he accepted.

Now Shorewood had been in one particular like every other community in the state. It followed the fashion of having victims for every communicable disease—new or old. The schoolhouse was the breeding ground. From the school spreads the disease wave.

"It was naturally assumed that a case of measles would be followed by another, and another, and still another and so on," said Mr. Sieker in explaining conditions when he took the job. "Usually a single case in school would be followed by others in the same grade. The first year brought us a total of 219 cases of disease that medical authorities class as preventable."

That first year's work was, certainly, not a very creditable showing to the new health régime. And the man who realized this better than anyone else was Health Officer Sieker. But he had courage and saw light ahead.

Why was it that so many communicable diseases spread in this community?

"Many causes contributed," explained Mr. Sieker. "Physicians failed to report, or were not prompt in doing so. Others, not knowing when they crossed that imaginary line separating Shorewood from Milwaukee, sent their post card notices to that city. Where no physician was called, parents invariably failed to report. In time these matters were remedied, but a situation more puzzling confronted us. From one to six weeks would usually elapse from the incidence of the disease to the time when a physician would be willing to make a definite diagnosis of whooping cough. In the meantime the child afflicted would freely mingle with others and attend school. From several days to several weeks would pass before sufficiently definite clinical symptoms would warrant a diagnosis of scarlet fever. One day a malady would be called a sore throat, the next day tonsillitis, and diphtheria the next, and until the final diagnosis of diphtheria there could be no official quarantine. 'Just a cold' would become measles a few days later.

"The local board of health came to the conclusion finally that mere compliance with the law and reporting and placarding promptly, while conducive of much good, were wholly inadequate measures to control communicable diseases. It did not *prevent* our children from becoming afflicted with *preventable* diseases. It was essentially a failure in Shorewood, as I believe it is to be elsewhere.

"At the beginning of the second year, September, 1918, the board of health, at a special conference attended by teachers, school officials, village officials, clergy, and others, announced its intention of inaugurating a new policy. This policy embodied three departures from its previous practice, briefly stated as follows:

1. Isolating first, and diagnosing afterward;
2. Placarding on suspicion; and
3. Substituting in large part educational propaganda for the exercising of police powers.

Above—The Shorewood Public School
Below—W. C. Sieker and his family.

"It was agreed upon that no child henceforth was to be permitted to remain in the schools if he had a cold, a cough, a sore throat, or was otherwise indisposed, no matter how mild the symptoms. Consideration for the comfort of the child itself should prompt such a course, and when one takes into account the potential mischief in its presence, failure to exclude strikes us as a reckless disregard for the rights of others. An excluded child was to be readmitted only after it had been definitely determined by competent medical authority that its illness was not communicable. The burden of proof was shifted. The public interests were to be paramount, and those of the individual secondary. It was pointed out to the citizens that this policy was made necessary by reason of the fact that the medical profession had not yet advanced far enough to enable the most skilled within its ranks to differentiate between whooping cough, measles, diphtheria, scarlet fever, and other so-called children's diseases from an ordinary cough, sore throat, or a common cold when the first symptoms appeared, and that at the outset the diseases in question are already exceedingly contagious. 'Isolation first and diagnosing afterward' was to be the invariable rule."

There is nothing new about this doctrine of isolation. It has been practiced in every community of the land haphazardly for years. But the doctrine was brought home with strange force to the new health officer. One day he met a man on the street who owned a large farm only a few miles from Shorewood. This man is reputed to be the largest milk producer in the world. As Health Officer Sieker saw him coming he thought of his troublesome health problems.

"What would you do if you discovered a cow in your stables some morning that was acting not exactly right?" asked the health officer.

"Isolate it!" shot the reply. "We cannot afford to take chances. Cattle are too valuable."

Health Officer Sieker never forgot that lesson.

"Cattle are too valuable" was a phrase that rang in his ears. "What about children?" he asked himself.

Here in a terse and homely street corner conversation he had been told by a farmer the way to master the Shorewood disease situation. Into the work he started with a new enthusiasm.

"Results seemingly have justified this program of radical exclusion," says Mr. Sieker in speaking of the accomplishments. "Paradoxical as it may seem, school attendance has become more regular. During the past year not one child contracted whooping cough, diphtheria, scarlet fever or any other common children's disease while attending the public school, and only one child managed to get into the parochial school carrying contagion with it. That one child created enough mischief to account for about one-fifth of the total reportable diseases for the year, and was directly responsible for the loss of approximately 800 half-days' attendance. The record of the schools for the preceding year was equally good.

"Shorewood takes the position that just as a worker in industry should be surrounded by every safeguard on the assumption that he has a right to as many fingers when he leaves the factory as when he went in, so have the children the right to come back from the school at night as well and free from infection as when they left their homes in the morning.

"The second point in the new program consisted in placarding houses on suspicion. When clinical symptoms were inconclusive, but circumstances warranted a suspicion, homes were placarded 'whooping cough suspected,' 'influenza suspected,' 'scarlet fever suspected,' as the case might be and the same quarantine regulations were maintained as though there were no question as to the diagnosis. Though quite a number of homes have been placarded on suspicion, the number of erroneous guesses has been negligible. The virtue of this expedient lies in the fact that erroneous guesses never result in injury to anyone while a 'correct' suspicion is often the means of preventing much needless suffering. Especially in dealing with whooping cough has placarding on suspicion been helpful.

"Next, the Shorewood board of health resolved upon a program of education. The way to correct the universal indifference of parents and the occasional neglect of the physicians in the matter of reporting communicable diseases is not by making a horrible example of some offender, saying or writing ugly things to him, or threatening, or bringing him before the bar of justice. Violations of the law and of other regulations are usually not willful. The offenders know no better. They need to be educated, and the most highly educated in the scholastic sense need the schooling in matters pertaining to public health usually as much as those to whom we attribute a lesser degree of intelligence. Indeed, the latter are often much more teachable. They look upon the preaching of the health officer as the expression of a superior wisdom, and accept his conclusions and mandates with the credulity of a child.

"Through our educational propaganda we are trying to establish a sentiment, and have largely succeeded in doing so, of having it looked upon as a discredit, if not a disgrace, for contagion to travel to a second family. It is a most unusual thing to find two placards of the same kind in a neighborhood at the same time. The Shorewood mother is determined that so far as it lies within her power, if she should be so unfortunate as to have an afflicted child in her home, the contagion shall not travel to a second family.

"Faithful observance of the doctrine, 'Isolation first, and diagnosis afterward,' has borne good results. Two hundred and nineteen afflicted with communicable diseases was the record the first year. The following year the number dropped to twenty-three, and the year that closed August 31 brought a total of sixty-three. During the past year two accidents contributed one-third of the total; and the other two-thirds were infected by making contacts outside of our limits.

When the official handbook, issued by the state board of health, declares that scarlet fever is communicable for probably six weeks, what could justify a layman in taking the position that the state board is probably mistaken? I am happy to be able to report that most physicians, cognizant of a duty to the public as well as to their patients, invariably support the health officials. When in doubt, the public is given the benefit of the doubt. We would rather quarantine a week too long than a week too little. Probably due entirely to luck, but possibly due, in part at least, to the rigid enforcement of the regulation, we have been fortunate in having had no so-called return cases during the past two and one-half years."

And now, so far as possible, Shorewood's policy is to become a state policy. Recently a conference of all the health officers of the state was held. To it came physicians, nurses, welfare workers and health officers. The Shorewood policy was discussed and dissected. It stood the test.

If Shorewood, whose population ebbs and flows daily like a tide, can make such a record, what possibilities there are for communities free and far from the "madding crowd's ignoble strife"! This is the way attending health officials viewed effective communicable disease control. Like many intricate problems its solution when found is simple. Thousands of pamphlets telling the story of Shorewood's health régime are now going to every community of the state and to every state health department of the nation.

"It's one of the best plans that I know of for the control of communicable diseases that annually take their toll in days of sickness and in thousands of deaths in every city and every state," said Dr. C. A. Harper, Wisconsin's state health officer. "And the scheme is so simple that every community in the nation can enforce it with good results. It is a rejuvenation of that age-old maxim that an ounce of prevention is worth a pound of cure."

Gentile Fall Involved in Hope of Jewish Rule

The "Messiah" to Be a Military and Political Ruler: How the Jews Mislead Opinion by Claiming Words That Do Not Belong to Them

THE first step in preparing a revolution is to teach the people to expect one. In the United States a great deal of this preparatory work has been done, but has come to naught. The cause of the failure was not any fault of the stealthy disseminators of revolutionary fear, but was mainly the non-Jewish character of the American people. There is an element in the nature of the true American which renders him immune to the final Jewish inoculation. The American will "fall" for the debased theater supplied by the Jew; the American will go into the "money game" based upon the false Jewish doctrine that gold is real wealth; the American will apparently "play up" with the Jew for quite a distance; and then, when the time seems most opportune to slip into the American that fatal toxin of national and international disorder, an element deeper than any yet recognized in American character rises to the surface and the game is up.

There certainly was an attempt made in the United States during 1919 and 1920 to create a mood of fearful expectation on the part of the American people. The movement arose and reached its greatest power in the Judaized portion of the United States, which is the East. If you take a map and mark off a thin strip half way down the eastern coast line, you will have designated that part of the country which is in a constant ferment, not because it is more "progressive," but because it is so continuously receiving poisonous injections of revolutionary doctrine from its tremendous over-population of Eastern Jews. From this thin eastern strip of the United States the poison spreads throughout the country upon the wings of "liberal" publications subsidized by Jewish money, assisted by the voice of "professors" who have made themselves agreeable to the Judaized colleges of the East, and various organizations of destructive intentions whose stationery bears the date line of New York.

This feeling for the downfall of things is religiously Jewish and is found throughout those writings which deal with the coming Messiah. A thousand proofs exist of the extent to which the idea of disorder is interwrought in the Jewish mind with the idea of the subjugation of the gentiles.

(The reader may observe the small "g" just used in the word "gentile." This is in conformity with the best Jewish usage both ancient and modern, as it may be interesting some time to show. It is really wonderful how Jewish writers to the "letter boxes" of American newspapers in this day and generation are permitted to flaunt that small "g" in the face of all the editorial blue pencils.)

Three Minds With Nearly the Same Thought

AT THIS Christmas season, when the annual protest is being made by Jews against Christmas songs and celebrations in the schools (for it must be remembered that Christmas is regarded as being as "anti-Semitic" as the B'nai B'rith says the "Merchant of Venice" is, and as Rabbi Coffee says the New Testament is) it may be interesting to observe just how the two things, revolution and world rule, come together from another angle.

But, preliminary to that, observe a trilogy of recent opinions as to the nearness of revolution in the United States. The names involved are very interesting, since they are, Woodrow Wilson, as mentioned by Governor Cox; Colonel E. M. House, the reputed author of "Philip Dru, Administrator"; and Bernard M. Baruch, whose war activities have been partly noted in these columns and who has recently received an additional testimony of favor from President Wilson.

In 1912 a book appeared entitled, "Philip Dru, Administrator," bearing the sub-title, "A Story of Tomorrow—1920-1935."

The book has always been attributed to Colonel House and never denied by him. It deals with a young southerner, Philip Dru, who organizes an army in Wisconsin and seizes control of the United States, after fighting his way to Buffalo. The title "Administrator" is used to denote what is usually called a usurper or successful revolutionist. The revolution was "against the government." (p. 124) It was not a rising of the American people—"Western Ohio, Indiana, Michigan and Illinois, while occupied by General Dru, were divided in their sympathies." (p. 124)

What the book means, more than one man has sought to determine. As a story it means nothing. As a story, it is pitiably weak and aimless. As a story, there is nothing to justify the trouble and expense which certain people assumed in order to boost its circulation. Yet it has lived since 1912, and more than one edition has been printed. There are only three possible reasons for its survival and its circulation: first, the natural curiosity attaching to a work credited to Colonel House; second, an unusual interest in the subject of exploding the present governmental system of the United States; third, a curiosity as to the possible existence of prophetic accuracy in the book's choice of dates. The first of these possible reasons is entirely inadequate.

"In the year 1920, the student and the statesman saw many indications that the social, financial and industrial troubles that had vexed the United States of America for so long a time were about to culminate in civil war," so runs the opening sentence.

But throughout the book, the people do not participate. It was a minority affair, as all revolutions are. A few swift bold strokes, a nation awed by the suddenness of it all, unable to act for lack of leadership; and then a dictator at Washington!

All this between 1920 and 1935. "A Story of Tomorrow." And yet, not much of a story, but very much of an *idea*. So much of an idea, indeed, that some people circulated the book for the sake of that idea.

"Maybe No Presidential Election in 1920"

NOW, this same idea seems to have circulated more or less freely through the whole circle in which Colonel House, the reputed author, moved. Colonel House was at the Peace Conference. Indeed, before there was a war or a peace conference his house in New York was referred to as the "American Number 10 Downing Street," because he exerted so mysterious an influence upon the administration. There are two stories accounting for that influence, both of which may easily be true. Within the circle of Colonel House was also Bernard M. Baruch. Whether they are both in the same circle now is a question. Mr. Baruch has been credited with bringing about the break between President Wilson and Colonel House, but this has been denied. President Wilson and Colonel House were taken ill about a month apart, though Colonel House has apparently recovered.

But even with so practical a business man as Mr. Baruch, the idea of something similar to "Philip Dru" seems to have been present. In his testimony given before the Senate Committee early in 1920, part of which has been given in this series, he expressed in these words an opinion about the future:

> "So I express this opinion, that *unless we have some great cataclysm,* some visitation of Providence, *some effort on the part of the people to establish a new nostrum or cure-all by some form of government that we do not care about . . . .*"

The idea of a possible smash-up seems also to have been present in President Wilson's mind, if the remark of Governor Cox at New Haven, August 27, can be relied upon. The New York *Herald* of the next day reported that

> "Governor Cox recounted a talk he had more than a year ago with President Wilson asserting that the President at that time had fears that a delay in the ratification of the Treaty might result in a condition in the United States where there 'might not be a presidential election in 1920.
>
> "'And the President said to me,' Governor Cox continued, *'Perhaps there will not be any presidential election in 1920.'*"

Making History Fulfill Prophecy

THESE three expressions, coming out of the same circle, indicate the sharing of the same idea, although the President's expression may very well be accounted for by the information which he may have possessed of the plans being made in this country for the operation of the revolutionary machinery.

Now, no one acquainted with Jewish hopes throughout the centuries will question that the hope of Jewish teachers for the full emancipation of their people has been bound up with the downfall of those political powers which are called the "gentile." It is to this teaching that much of the Jewish interest in revolutionary technique and propaganda can be traced. This teaching is not to be found in the Old Testament, for the Jews are not "the Old Testament people" that many Christians fondly imagine; it is rather to be found in the secret books of the Jews, whose teachings are the accretions of the centuries.

The Messianic expectation of the Jews is largely bound up with this. In an article by Mr. V. Anichkoff, the Russian scientist, printed in the magazine *Asia* early in 1920, this statement appears:

> "At the present time, there is a great national religious fervor among the Jews. They believe that *the promised time of the rule of God's elect on earth is coming.* They have *connected Judaism with a universal revolution.* They see in the spread of revolution the fulfilling of the Scriptures: 'Though I make an end of all the nations whither I have scattered thee, yet will I not make an end of thee.'"

This promise, of course, the Jews of today apply to the members and descendants of the tribe of Judah, although when given through the prophet Jeremiah it applied also to Israel, and, as any careful reader of the Jewish Scriptures knows, Judah and Israel are not synonomous. In Biblical language, Judah is to be known to all the people by the "show of their countenance," that is, by the cast of feature, which we now know as Jewish; but Israel was not so to be known. Judah was also made a vexation and a curse to the other peoples; while Israel was not so stigmatized. In claiming to be Israel, all of Israel, the Jews have succeeded in giving themselves a place in the estimation of those who believe the Scriptures, that is not warranted by the Scriptures themselves.

The Jews who interest themselves in these things have long sought to learn from the signs of the times the precise hour when the expected victory of Judah would be complete. Julius H. Greenstone, of Philadelphia, who wrote in 1906, and whose word will scarcely be questioned seeing that his book is sponsored by the Jewish Publication Society, says in the notes to his book, "The Messianic Idea in Jewish History," that the children of the Jewish schools used to take the values of the Hebrew letters as the vehicles of occult information (it should be borne in mind that the Jews as a race are darkly occult), and that out of the first word of the Hebrew bible they made this message:

"At the fall of Russia, in the time of Alexander the Third, the Tishbite (Elijah) will make his appearance."

Always it is the fall of some so-called gentile power that paves the way for a new flood of Jewish glory.

The Serpent Swallowing Its Tail

THE same note was apparent also in some of the utterances made upon the occasion of the Jewish new year, 5681, which began September 13, 1920. The sum of the numerals 5681 is 20, and this in conjunction with the fact that the number of the year in the Christian calendar also ended in "20" was taken as a good omen of mighty portent. Indeed, Rabbi Rappaport, in a Chicago Jewish paper, changed the numerical value of the number of the year into Hebrew letters and found that it denoted "Healing."

The symbol of Jewry, as mentioned in the Protocols, is a serpent, and the completion of the World Plan is represented by the serpent swallowing its tail, thus making a complete circle. There is in existence a map showing the progress of the serpent out of Russia, across Germany, turning to take in France, Italy and Russia where its head touches its tail again, denoting a complete circle inclosing Europe within the ring. It was estimated that this process would occupy until 1925. The sum of the Jewish figures denoting the year 1925 according to the Jewish enumeration will be the perfect number 7.

It is no wonder that the Jews of the world were well content to let exposure of their apparent plans take any course whatever, as long as it did not involve bringing to light the Protocols. Anything else they are willing to put up with, but when the Protocols are mentioned they are at once greatly disturbed. They are willing to discuss poor Sergius Nilus, or anything else, but not the contents of these documents known as the Protocols. They will endure coarse ridicule, unfair abuse, contempt and ostracism; but mention the Protocols and you strike fire.

No Jewish spokesman or Jewish publication has had the courage to stand the facts of current Jewish operations alongside the plan outlined in the Protocols, and allow the whole case to be judged by the presence or the absence of a parallel between them.

The Protocols are and will remain the most perfect plan for the destruction of Christian society ever brought to the light by madman, criminal or master dreamer, but the Jews would have no reason to fear them more than the story of Robinson Crusoe if they did not parallel Jewish activities as these are observable by all the people.

Let the Jewish leaders stop the stupid shout of "Forgery!" and let them prove that the Protocols have no reflection in present-day Jewish achievements, and their case is won.

This is the very thing they have not attempted to do, and yet this is the very ground on which fair-minded men, who never had and have not now a single anti-Jewish instinct, find it impossible to throw the Protocols aside, as they would gladly do if only for the purpose of feeling again that the world did not possess this masterpiece of satanic wisdom.

That Bolshevism was not the beginning, but only the visible coming forth of this plan of subversion, is received by all students of world affairs, because of the impossibility of making Bolshevism other than Jewish. It was not the so-called "anti-Semites" that made Bolshevism Jewish, it was the Jewish Bolshevists. Jewry has always admitted it, and even now the denial of the collective Jewish organizations of the United States is not convincing even to the Jews themselves. When Bolshevism was hailed by the whole world as an honest attempt at the reconstruction of social life in Russia, the Jews had no hesitancy whatever in proclaiming their part in it. They know today as well as they ever did that their part remains.

Perpetuating Baruch's Handiwork

FOR the benefit of readers who considered the personnel of the Russian Soviet Government as given in these pages a few weeks ago, it may be said that the latest information is that, instead of growing less Jewish, the Soviet Government is growing more so. "Persecution" makes no difference to the Jew; he goes ahead with his plan, almost gaily.

In our own country the "fear of the Jews" has led to more honors being shown them this year than ever before, and the three latest public acts of President Wilson, barring his message to Congress, have been the appointment of a Jew to represent the United States in the Aland Islands dispute; the appointment of a Jew to act for the United States as between the Turks and the Armenians; and a laudatory letter to Bernard M. Baruch, who found the War Industries Board such a good thing that he now perpetuates it in a permanent organization. This latter act of Mr. Baruch has a counterpart in Eugene Meyer's activity toward the revival of the War Finance Board, both of which appear to be efforts toward the solidification of the Jewish Government that ruled the United States during the war.

The Jews object—to go back to revolutionary Judaism as seen in Russia—that Trotsky, while a Jew by blood, is an apostate to his people. They point to his statement that religiously he is "nothing." If the reports of addresses that Trotsky made to his special Jewish troops can be believed, Trotsky is a Jew of the true and revolutionary faith and relates all that he is doing to the hopes of his nation. Men who have heard him have reported his words, and they are the words of a Jewish military Messiah.

It is not out of keeping with his character, however, upon learning that Bolshevism had been identified as purely Jewish, to send to America the disclaimer which he did. Indeed, it is quite in keeping with the whole plan. It is just as much a part of the plan as the "expulsion" from Russia of certain Jewish American socialists: it is one of the best ways to get Bolshevik missionaries back to the United States—with perhaps some trinkets taken from the bodies of the czar's daughters, to be sold at high prices as trophies of a noble victory over a gentile power.

In refusing to line up Jewish activities and achievements alongside the written program of the Protocols, and in denying the Jewish character of Russian Bolshevism, the American Jews who signed the latest manifesto to the American people have done just one thing—they have shown by their signatures and the appended names of their various societies just how well organized they are here in the United States.

One is entitled to remark upon the repeated cry of "Forgery!"—if the Protocols are a "forgery," what must the originals be!

The Jews say that the study which is being conducted of their activities and achievements in the United States and elsewhere constitutes "the worst persecution" to which their race has ever been subjected. If this is true, it throws a very valuable light on the other "persecutions" to which so much pity has been invited.

But it is safe to say that not a single Jew in the United States has been inconvenienced in the slightest by the disclosures. The good citizen of Jewish origin simply says, "I don't know anything about this plan, and if such a plan is in existence I heartily denounce it," and if he is a man whose life in his community has been such as to give worth to his words, his statement is accepted. But that is not the usual course; ordinarily the Jew rushes to the defense, without weighing the charge. And it is this loyalty, splendid in itself, which the leaders of the World Program confidently count upon. Whatever they do, they know that no amount of exposure will alienate the Jew; he remains firm and steadfast, the defender of all things Jewish, regardless of what nature they are known to be.

The "end of the times of the Gentiles" is the one glowing period of history to which the Jew looks hopefully. And if the present times are indeed "the worst persecution" which the Jews have passed through, they even look at that as the certain precursor of the Day of Judah; for it is written in the Messianic hope that the days before Judah's deliverance shall be his darkest.

The rabbis of the Talmud, and they are even today the real leaders of the thought of Judah, prophesied that the arrival of the Messiah would be preceded by "the Messianic woes," which are largely political disorder and anarchy. Great distress will engulf the world. Christian churches shall fall. The nations shall be gathered together and destroyed. Some of the rabbis interpret this "destruction" to mean subjection to the Jews as a world power.

Max Nordau Said He Was Not "Messiah"

THE Messiah for whom the Jews have looked during the centuries is not the kind of Messiah which the Christian world has visioned. He was to be Divine only in the greatness of his natural gifts. One of his names is "Hadrak," which means "sharp-mild," which being interpreted means that he will be harsh to the rest of the world and gentle to the Jews. He will be a military and political leader. No divine revelation is expected to come with him, for the Jewish assumption is that there is and can be only one lawgiver, namely, Moses. Messiah will die, and his son reign in his stead, and his son after him, in the line of a Jewish hierarchy over the earth.

So keen was the expectation of Messiah in recent years that Max Nordau, the Zionist leader, was moved to make a public announcement to the Jewish people that *he* was *not* the Messiah, and neither was Herzl.

In short, "the time of the end" for the Gentiles, is the "time of the beginning" for the Jews—according to this teaching.

Unfortunately, many Christians give credence to this on mere hearsay. The Jew has "put over" a good deal on well-meaning churchmen. The cornerstone of all the error lies here: that all who are not Jews are Gentiles. All who have not "the show of countenance" peculiarly Jewish are Gentiles, and all who have that "show" are "the chosen."

When it is known that the Jews, even Scripturally considered, are only one tribe of Israel, and that the rest of their nation could not live with Judah (Jews) because of its darkness and perversity, it ill becomes anyone to give all the glory of Israel to its least progressive tribe, which tribe is Judah. Now between the *Jews* of Judah, and the *Gentile* races of the world, there is the great nation *Israel*—promised to be a mighty people, a company of nations, ruler of the seas, among whom even the Jews were to be outcasts and strangers until the latter times. And in the latter times, the prophecy reads, it is not the Jews who shall take Palestine and rule the world, but it is Israel who shall take Palestine and send or permit the Jews to go there to live. The Jews never have and never will, in their own right, as one tribe, as Jews, hold Palestine of themselves, and rule from there. But Israel will, and there are numerous scholars who say that Israel is the progressive white race, Saxons and Christians. The "end of the Gentiles" is not the rise of Judah, but of all Israel.

Zionism and the Messianic Idea

THIS is said to prevent well-meaning Christians being "taken in" by the false claims of the Jews to be the center of things. Once the distinction between Jews and Israel is clearly seen, Judah steps back into his own place. The distinction is not then between Jews as the "chosen people," and Gentiles as outsiders. The order of precedence is at the present time, Israel first, Judah the outcast who through the blessing of Israel is yet to have a place to dwell in, and then the Gentiles, the outer ring of lesser peoples, who are inferior and will remain so until they die out as the American Indian is doing. The Jews' own scriptures say that Judah is a *vexation* to Israel. The latter glory is foretold for *Israel*, not alone to the rebellious and now sadly darkened single tribe of *Judah*.

The Messianic idea has been greatly stimulated in recent years, and somewhat modified by the unparalleled success achieved by the Jews in governmental affairs. Says Greenstone: "The elevation of the Jews to high positions in the councils of the states and in the world of finance were interpreted by another class of Jews as signs of the approach of the Messianic era."

"Now is the time," cried the Rabbi of Thorn, "as so many Jews have been elevated to high position, and are able to exert their influence over the rulers of Europe."

And now the Zionist movement stands as "the latest phase of the Messianic idea in Jewish history." But, says Greenstone, who makes that statement, Zionism relates only to settlement in Palestine, whereas Messianic expectation includes something more: "Zionism aims at the establishment of a Jewish State in Palestine under the protection of the Powers of Europe. The Messianic hope promises *the establishment, by the Jews, of a world-power in Palestine to which all the nations of the earth will pay homage.*" (p. 278)

And if there be those who see in Zionism and the Messianic hope one and the same objective—is it at all unnatural?

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

"I don't know whether the numeral '13' has significant portent for the Jew or the Gentile," writes a correspondent. He can see, however, that influences are at work which means "13" for one or the other.

The British voter has not much of a choice, according to an English writer who lines up the political "field" this way: "The Jew power behind Mr. Lloyd George, the Jew power behind Mr. Asquith, and the Jew power behind Red Labor." You take your choice and however varied the labels may be you get very much the same thing.

The New York *World* prints the report of a speech in which it was said that every motion picture screen would be utilized to fight the movement of an American instead of a Continental Sunday. The pledge, of course, is based on the acknowledged Jewish control of the motion picture industry.

The London *Morning Post*, which recently called for the removal of Sir Herbert Samuel, as British High Commissioner in Palestine, now calls for the removal of another Jew, Norman Brentwich, head of the Palestine judiciary, on the ground of favoritism to Jews.

Says a German writer: "At the post-mortem examination of a body lately, there were present the district physician, the lawyer, the surgeon, and a fourth official, all of whom were Jews. None but the corpse was a German. Behold a picture of the present!"

Many American editors are being "taken in" by Jewish propaganda against THE DEARBORN INDEPENDENT's study of the Jewish Question. If the editorials which are being received represented the editors' own opinions, they would be significant. But in almost every case they are mere perfunctory rehash of Jewish printed propaganda which is being assiduously circulated and forced into the newspapers through the influence of local Jewish advertisers. The ideas come in precisely the same order and often in the same words as they are found in the Jewish propaganda. In this way, many errors get across, the principal one being that this paper has linked Freemasonry with the Jews. Editors, as a service to their country, ought to study the question for themselves.

Jewish papers frequently froth at the mouth because of occasional suggestions that the Jew is not enamored of soldier life. In the United States, at least, this suggestion has always come first from the military authorities, who ought to know. For example, in the *Congressional Record*, of May 14, 1918, page 7,057, there is a statement that Provost Marshal General Crowder, with the approval of Secretary of War Baker issued on February 14, 1918, the following instruction to medical examiners:

> "Causes and Motives of Malingering. These must be clearly understood in order that medical examiners may be on the alert for deception. The foreign-born, and especially Jews, are more apt to malinger (to pretend to be ill) than the native-born; Eastern Europeans more than Western Europeans."

There was, of course, the usual complaint from the Jewish lobby at Washington, and the offending words were stricken out, but the order must have been based originally on the knowledge of the authorities.

A Jew cannot be naturalized in England as a Jew. He must swear that he is of some other race, German, Italian, Russian, Pole or what not.

"So when you Labor men attack Capitalism, you must know just where to train your guns. It must not be on mill-owners, or master engineers; it must be on the controllers of all capital, the men who at present rule master and men alike, the money-lending Jews who are the emperors of all Capital."—Dr. J. H. Clarke, London, England.

Rabbi Coffee, of Toledo, recently wrote that "every copy of the New Testament is breeding anti-Semitism." And now comes Rabbi Leibert, of Spokane, protesting against a Christmas Tree celebration by the Spokane Post of the American Legion. According to a Spokane newspaper, Rabbi Leibert's protest is that Christmas is "sectarian," and therefore ought not to be countenanced by an unsectarian organization like the legion. The legion commander replied that he was unable to agree with the point, and at last accounts the Christmas celebration was going forward as planned. The West is able to deal with these questions more independently than the thoroughly Judaized East.

In the preface of a little book on the Russian Revolution, Dr. Oscar Levy, himself a Jew, says: "Jewish elements provide the driving force for both Communism and Capitalism, for the material as well as the spiritual ruin of the world."

A Jewish boast has been made that in 20 years they will control dentistry in this country. In New York 85 per cent of the dentists are Jews. Out of 1,503 matriculates in dentistry at a certain university, 1,478 are said to be Jews.

Are We to Poison the Lifeblood of the Nation?

Save America, Plea of Representative J. C. Box, of Texas:

IF AMERICA is lost, the world will grow visibly darker, even to the people of foreign lands, and all that is worth living for will have been lost by us, whether we came recently or our fathers came long ago.

The affinity between wealth and its seekers is far below that between liberty and its lovers. "When wealth increases, men decay." America might gain a whole world, and yet lose its best self, that which distinguishes it from the lands whose people in millions are leaving them now.

Another thing which would de-Americanize America would be a population or citizenship with divided allegiance—a hyphenated population, a hyphenated citizenship. The ills which beset countries are numerous and serious enough to require the wholehearted loyalty of all the people. Big home problems and foreign difficulties can be adequately met only when there is a united and supremely loyal citizenship, permitting no illicit love affairs with outside affinities to divide and debauch the national household.

The relationship and spirit of American industrial life can be changed to the undoing of America. We want no peasant or peon or coolie class nor caste system dividing us into an upper and a lower world. The countries whose people are fleeing from them have such relationship between labor and the rest of mankind. Their coming promotes that condition here. When men put their thumbs in their vests and speak of importing "labor," they are not thinking of men and women to become neighbors, friends, and associates; they are speaking of underlings, whose coming will not increase the attractiveness of labor to America.

This is the first of three articles dealing with phases of the immigration problem now under discussion in Congress.

IN ALL history, the great nations of the world at their high mark of civilization have been challenged and in most cases overwhelmed by barbarian forces which came to reap the harvest others had sown.

Belshazzar, in the heyday of Babylon's magnificence, read the handwriting on the wall and the grandeur of the kingdom departed, and the rule was given to the rough Medes and Persians.

Greece, at the height of her cultured elegance, succumbed before the barbaric legions of Rome, and now only a few transcendent lines of beautiful literature and a few broken bits of statuary remain to testify to the authenticity of the traditions of Athenian beauty, Doric strength and Spartan courage.

Rome, which boasted that its founders were reared by a wolf and which conquered the world with its might, was undermined by the effete influences of the very civilization it built, and was partitioned by the barbarians it despised.

Through the centuries of the Christian Era, dynasty after dynasty and nation after nation arose to enjoy a brief period in the sun and then sank into insignificance or were submerged altogether, when in moments they turned unprotected sides toward races for whom they had contempt.

And now shall it be America next?

In the hour of her proven strength, when her power of war has just passed in impressive review, when her supremacy in commercial and industrial enterprise is unquestioned, when her financial position seems relatively unassailable, and when her resources in power, agriculture and minerals seem adequate for centuries, America's civilization is facing the threat of the ages—the onrush of alien hosts.

No less is the danger of the submergence of our people, the vanishing of our ideals and ascendency of parasitism in the place of stalwart productivity, because the incoming hordes enter as supplicant immigrants in peace rather than as armed forces in war.

When the civilization of former nations received a fatal thrust, it was a thrust of war.

No less menacing to the United States are the threatening millions, because their weapon of attack will be the weakening and the poisoning of the lifeblood of the nation from within.

One hundred thousand immigrants a month are entering the country, chiefly through the Ellis Island gateway at New York City. A fragmentary portion of these contain possibilities of becoming producing citizens of the type which formed the nation's foundations. The vastly greater number are the offscourings of Europe, the criminals and the parasites whom exhausted countries are throwing out in the gasping hope of saving their own land even though the measure means the sinking of another country.

For weeks and months the coming of the great horde of undesirables has been heralded in the newspapers and magazines. Reflective men have been pointing out the alarming dangers the situation presents. The unanimity with which the character of the immigrants has been assailed is unparalleled in American politics.

In the entire country, not a single voice has been raised in defense of the type of immigrant who is gaining entrance. But despite that fact, not a single hand has been outstretched to stay present immigration in any degree.

The questions present themselves:

Why does this condition exist?

How great is the danger?

How can it be remedied?

In answer to the why, these elements must be taken into account:

First, a national inheritance of ready sympathy with the unfortunates of all lands.

Second, the slowness of the machinery of legislation to function in response to undoubted needs.

Third, the ability of powerful racial and commercial influences to obtain exceptions and provisos in their interest when at last the national Congress is moved to act for a general cause.

Fourth, the powerlessness of Congress to enact restrictive legislation which may be subject to the attack that it is class legislation.

(C) U. & U.

REPRESENTATIVE ALBERT JOHNSON, of Washington

Sponsor of bill to prohibit immigration, which has passed the House.

Fifth, and most important of all, failure of enforcement agencies rigidly to require the observation of the restrictive provisions in the immigration laws which have been enacted.

It is an unfortunate but unquestionable fact that the very thing which was the strength of the country in the days of the forefathers is its greatest weakness today, namely, the fostering of the idea that this country is refuge for the oppressed of all lands.

In the early days, two and three centuries ago, even 75 and 100 years, this country was a wilderness whose destiny required the strong hands and hearts of courageous people.

There were savages to be subdued. There was timber to be felled, land to be tilled, transportation lines to be built, and in later years, factories to be erected before the country could reach that prosperity which today tempts the itching fingers of less industrious stock. To accomplish these missions, there came to America the early pioneers.

They were men and women whose clear minds demanded political freedom, and whose unyielding consciences insisted upon religious freedom. Political and religious oppression at home caused them to cross the ocean and seek new homes amid the hardships of a new country.

In the development of the country this sturdy stock maintained its dominance and assimilated and converted to its own ideals the weaker elements which drifted in.

With the passing years, what was more natural than that this pioneer stock should encourage the idea that the land it developed was a perpetual haven for the persecuted and oppressed of all lands? The tradition that America was the world's free home for unfortunates became rooted. It found its way into the copybook maxims of the nineteenth century and survives today.

Hurrying Americans of this generation have been in the habit of imbibing their knowledge from brief catchy slogans. Without analysis of its possible ramifications, they accepted the tradition that America is a perpetual world refuge.

The coming in these later years of the droves of undesirables seeking the easy wealth of the United States with the consequent slow awakening of the people has unsettled American faith in the ancient theory.

But as yet this awakened thought has been transferred neither to the written statutes of the land nor the vastly more important enforcement agencies. When half-hearted reluctance to admit newcomers has been manifested, the undesirable has had but to murmur in some form, "persecuted" or "oppressed" and the utterance has proved an unfailing password.

Happily, religious persecution has passed from the world, although Jews and Armenians, two of the races which furnish the greatest menace in present American immigration, are fond of ascribing their unpopularity to religious grounds, rather than to industrial oppression in which they themselves have been the oppressors.

This claim to religious persecution has been capitalized repeatedly under the present literacy test law. It now furnishes the chief hope of Jewish influences in the campaign already begun for "exceptions" in the proposed new immigration law.

Immigration problems did not arise in this country until comparatively recent years. The United States in the days when bread was literally earned by the sweat of the brow was not an alluring objective.

The industrial advance of the country first brought immigration to the fore at the time of the agitation for the Chinese exclusion, an agitation which began in 1870 and culminated in the first exclusion act 12 years later.

Then, as for many years thereafter, the restriction in immigration received its greatest impetus from labor, organized and unorganized. It was charged that great industrial interests were colonizing cheap foreign laborers in order to maintain low wage scales in America.

More or less agitation for restriction followed the Civil War but it was not until 1882 that a general law was enacted. This delay of nearly a score of years was the first of many delays which have hampered all attempts at restriction, delays due to the necessity of arousing public opinion before Congress could be brought to act, delays due to deliberate methods of congressional procedure and other matters.

The law of 1882 authorized the exclusion of persons who were mentally defective, paupers, persons afflicted with dangerous diseases, criminals and a few smaller classes. In 1885 the amendment prohibiting the entrance of contract laborers was enacted. Various other amendments came in the wake of subsequent agitation.

During the 80's and 90's, a new element entered the restrictive campaign. Influential and thoughtful public men agreed that the country's future was menaced unless all persons were excluded who were not capable, racially and from modes of living, thought and action, of being absorbed and assimilated with the existing population.

Their influence was turned toward a literacy test as the most feasible method of accomplishing the desired end. In 1897, several years of agitation culminated in the passage by Congress of a bill excluding persons who could not read or write English, excepting from the provisions only the parents or grandparents of persons already in the country. This measure was vetoed by President Cleveland in closing hours of the session, March 3, 1897. The House of Representatives passed the bill over the President's veto, but the Senate did not act.

For nearly a score of years thereafter renewed agitation for the passage of a new bill existed without effect. The congressional delays, the giving of rights

Romance Adds to Vogue of France's New Saint

Scarcely a Week Passes That Does Not See Lecture, Monograph or Biography on the Martyr Maid of Domremy

By ADRIENNE RICHARD

Paris, December—(By Mail).

GO WHERE you will in France today and you will not fail to be struck by the tremendous emergence of the cult of Jeanne Darc. In every church in Paris, the new saint has a special chapel dedicated to her veneration. And it is the altar in this chapel that blazes most brightly with the lights of numerous votive candles. About this shrine will be found gathered at all hours of the day more devotees than at any other, not excepting that of the Virgin Mary herself. The same is true in the larger provincial cities and in transcendent degree, of course, at the cathedrals of Rouen, Orleans and Rheims.

Before the formal canonization at Rome on May 16 last of the Maid of Orleans, France—and especially Paris—boasted many statues of the national heroine, not a few being of respectable antiquity; although it is doubtful if there is an authentic portrait of Jeanne in existence. Since the close of the Word War, however, both statues and paintings and prints of various orders have multiplied immensely. One displayed for the first time to the public on the very day of her canonization and which is conspicuous in the shop windows of the rue de Rivoli and the Avenue de l'Opéra is a brilliantly colored reproduction in which the conventional shining armor and high inspiration of the face and figure are accentuated by the luminous aureole of her newly achieved sainthood, the first picture to show this addition.

It is not merely that the renaissance of the soul of the nation inspired by the Great War has been reflected in this year's Salon by a frequent choice of *la Pucelle* as the subject of painter and sculptor. Not less marked is the popular tendency to regard as France's *liberatrice* and deliverer the now sainted heroine whom the Church burned as a witch 600 years ago, and to seek souvenirs in the shape of pictures, miniature copies of statues, especially the familiar statue in gilded bronze by Frémiet which adorns the rue des Pyramides where it debouches on the rue de Rivoli. This statue, by the way, has been taken as the symbol of an international women's organization called the Franco-American Women's League, recently organized here by a wealthy New York woman and a vignette of the statue appears on all the league's stationery and literature.

In literature, as well as in art, the efflorescence of this Jeanne Darc cult is increasingly manifest from day to day. It is an exceptional week which does not see the appearance of a new life of the saint, or a monograph or the announcement of a lecture on the glorious maid and her mission.

There has, of course, long been a Jeanne Darc Museum at Orleans. Within the last few weeks there has been organized "La Maison de Jeanne Darc" here in Paris. It is expected to take its place as a veritable temple where, as it was put by M. F. d'Andigne, municipal councilor, at the dedication, "all minds, from those most strongly attached to the Catholic faith to those least attached to any conventional form of religion, may find themselves united in the same national and collective religion—that of this Jeanne Darc, last figure of the past who is also the first of the time now beginning; that Jeanne who in the memorable phrase of Michelet "symbolized at once Virgin Purity and Native Land." This shrine owes its conception to the initiative of two great French authors, Anatole France and Maurice Barrès. It is housed in an architectural gem of the 15th century, the Hotel de Sens in the heart of old Paris in the St. Paul Quarter. In its various *salles* are arranged a wealth of souvenirs and relics of Jeanne and her time.

But what I set out to tell you was that I accidentally discovered the other day that there is a very pretty romance attached to the statue of Jeanne Darc which is most familiar and most talked of. This is the statue made by the young French sculptor, André Vermare, the original of which adorns the Cathedral of Orleans, a replica being enshrined in the Church of St. Louis des Francais at Rome, and copies of which are in nearly every church in France and in many private chapels. This statue, in effect, may be regarded as the *official* counterfeit presentment of the new saint, the one stamped by Holy Church with its *imprimatur*. For the small sum of ten sous (about 10 cents at the normal rate of exchange), one may obtain a small photo-engraving of the statue at the *table des articles religieuses* which is so conspicuous a feature of every French church close to the entrance and presided over usually by a stout lady in black; the table where a brisk and steady trade is done in crucifixes, beads, metals, holy water founts, and pictures and statues of Jesus, Mary and the saints. Larger pictures of Vermare's Jeanne may be obtained up to 20 francs and copies of the statue in plaster of paris or terra cotta up to 100 francs or more. But you get your money's worth and then some in the little ten-sou picture I have mentioned, for it is well executed, bordered with gold and is in itself a sort of perpetual prayer. Under the picture is the legend: "Sainte Jeanne Darc Priez Pour Nous" (pray for us). On the back is printed a little prayer which may be translated as follows: "O God, who raised up Sainte Jeanne Darc to defend the Faith and the Fatherland, accord to us, we supplicate Thee, by her intercession, that Thy Church may surmount all the ambuscades of the enemy, enjoying perpetual peace. Through Our Lord Jesus Christ."

Now it appears that the report is being very industriously—although quite unofficially—disseminated that remarkable, not to say miraculous, results have been reaped through the devout and frequent repetition of this prayer with the picture of Vermare's statue before one's eyes. The Blessed Damozel leaning out from the golden ban of heaven seems naturally enough to take a special interest in French maidens and their problems. More than one young woman has confided to me the fact that, through this veneration of the Maid of Orleans, she has obtained a rich and noble lover or husband. Sweet reconciliation following lovers' quarrels has similarly come to pass on faithful repetition of the prayer. *"She brings good luck"* (Elle apporte le bonheur) is an expression often heard. And this fact has been tested to their satisfaction by many a flower girl and vegetable vender in the big Central Market. The prayer is also said to have proved wonderfully efficacious in forwarding the tremendously important state policy of France at this time in making marriages fruitful. And, of course, it helps the souls in purgatory.

JEANNE DARC, in Cathedral at Orleans

The gentle reader who is not a devout Roman Catholic may be a bit skeptical regarding all this; but readers who have any acquaintance with the new psychology—the influence of mind over matter—and who are willing to concede to thought and feeling when embodied in concrete form a subtle and continuing influence on human affairs will perhaps be ready to admit that "there may be something in it after all," when they have read the story of the making of the statue. "There is more in heaven and earth, Horatio, than is dreamt of in your philosophy."

Well, then, some ten years ago Vermare, a pupil of Falguière, captured the Prix de Rome and became a *pensionnaire* at the Villa Medicis in the Eternal City. Like his comrades among the young art students, he lived a careless, dreamy sort of life. His favorite amusement was throwing the *rutsica*—a sort of disk or discus like that with which the athletes of antiquity played in the courts of the villa garden. Often he betook himself to the high belvidere from which he could gaze on the distant Sabine hills, or he wandered in the umbrage of the Bosco. Presently, word came to him that the Vatican was preparing to beatify the humble shepherdess of Domrémy who became the liberator of France from the English invader. From that moment, Vermare entertained only one ambition, one intense desire, to create a Jeanne Darc.

A difficulty interposed in the matter of a model, for certainly Jeanne could not be considered as of the Italian type. As if in answer to prayer, a young French girl answered his advertisement. She was a girl from Jeanne's own province of Lorraine, and she entered sympathetically into the spirit of his plan, posing hour after hour and day after day with an imperviousness to fatigue which only the enthusiasm she shared with the sculptor made possible. He worked with ardor, with feverish impetuosity indeed. In less than thirty days, his task was completed. The cardinals were happy to accept his invitation to come to his studio and see the image of the miraculous maid. They judged it to be perfect in both conception and execution. Soon it was decided that this statue should figure in the solemn ceremony of the beatification. The Pope blessed it.

And this artistic triumph and ecclesiastical favor brought in its train certain substantial rewards of a material nature that are by no means to be despised when two young people rich in love but poor in this world's goods want very much to set up housekeeping for themselves. A certain successful Paris publisher of religious sculpture and pictures offered Vermare a contract to pay him a truly magnificent sum down (and yearly royalty to follow) for the exclusive right to reproduce his work. So the young sculptor and the model to whom he owed so much and who quite naturally fell in love with each other were married. That was in 1909. If they are not living happily ever after, it is not the fault of St. Jeanne, for out of his royalties André Vermare has become rich, very rich. They have three beautiful children and a handsome house near the Bois de Boulogne, besides a villa at Biarritz.

For my part, I should have thought that the statue of Jeanne by Chapu now in the Louvré, and with which Americans are perhaps most familiar through photographs and copies, would have appealed to the Church authorities as that most suggesting saintliness. You remember Chapu portrays the Maid of Domrémy rather than the Maid of Orleans: the simple peasant girl in peasant garb, barefoot and bareheaded, half kneeling on the ground, her lips moving in prayer and her face glorified by the rapt vision that proves the summons of her soul.

Instead, the seal of official ecclesiastical approval has been set upon a militant maid clad in steel armor from neck to foot, a sword girded at her side and bearing aloft a banner: *the banner of the Bourbons with its golden fleur de lis on a white background.* Is there not some significance in this choice? Bear in mind the fact the Church of Rome today, as always, is the strong supporter of the Royalist cause and the Royalist party in France, while the Royalists are ever the firm friends of Mother Church and the foes of democracy and the Republic. No student of psychology will underrate the power of suggestion. What then are we to say as to the possible effects of a daily association in the hours of prayer by millions of the people of all classes of the royalist standard with the nation's soul?

Let me add a word for the benefit of those of your readers who like myself have somewhat lost the habit of church going, or who, going to church, do not spare time or attention for the tables where religious articles are on sale. When I heard the story of Vermare's statue, I was naturally anxious to obtain a photograph of it. Day after day, I searched the shops of the dealers in art photographs along the rue de Rivoli and the Quai Voltaire and through the sidestreets in the neighborhood of the Fine Arts School (École des Beaux Arts). They showed me photographs of statues of Jeanne old and new by the score. But they had no photograph of Vermare's Jeanne, and could tell me nothing about it. Even at the "administration" of the Ecole des Beaux Arts itself, all they could tell me was that Vermare had indeed a proud place on the list of their students who had won first honors. Yet this is the Jeanne of all the Jeannes, reproductions and photographs of which are most widely diffused! At last I bethought me of my good friend the Vicar of Notre Dame. He was kindness itself and gave me the address of the great religious publisher in the Place St.

An Amazing History Is Sicily's

FROM various parts of the land come items from time to time relating Sicilian justice: a form of independent law execution which finds no favor in American eyes, but which seems most difficult to prevent.

It is not to be wondered at if the Sicilians take a shot at each other now and again, since from the dawn of history everyone has been taking a shot at the Sicilians.

This island, the largest in the Mediterranean, but small in comparison with other historic islands, has experienced a most amazing history; and it is only by remembering this history that Americans can ever begin to hope to understand the Sicilian himself.

The curious fact is that while Sicily is part of the history of every nation in Europe, it has no history of its own. And when, recently, the Sicilian peasants marched from their huts and took possession of great areas of land they were living again what happened thrice before in their own story, and many times in the stories of the invaders of the island.

The first inhabitants, and they appear as early as history is written, were the Siculi from Southern Italy. Then came the Greeks and Phoenicians, busy colonists; and then the Carthaginians. From that point forward a half-century of peace in Italy became something to gossip about. The island saw a succession of tyrants and conquerors, even including Genseric of the Vandals, and in 1060 (six years before William of Normandy conquered England), Robert the Norman.

From 1734 to 1860 Naples was ruled by Bourbon kings; at the latter date Garibaldi swept in and obtained Sicily for Victor Emanuel, and so the island became a part of the Kingdom of Italy.

These are only the barest high spots, for you can name almost any classic or medieval warrior of distinction and, on investigation, discover that either he conquered Sicily, or intended to conquer it, or bargained for it, or got killed in it.

The point is that the Sicilians never have known, until within the last half-century, what it is to be secure; they have led a fugitive existence, subject to a continuous series of military drafts and participating, without any scrap of national purpose, in everybody's fights. This has to be remembered in judging the Sicilians today.

The bulk of the Sicilian population is very poor. A small but comparatively wealthy class—composed principally of the owners, or *latifondi*—controls practically all the land, and most of them don't even reside in Sicily, preferring the social advantages of Rome, Naples or Paris. The class which elsewhere would be called the middle class is extremely poor. This straitened condition has been the cause of most of the abuses which vitiate Sicilian life.

In the last ten years of the nineteenth century the Sicilians began to emigrate, and in three years 220,000 workers had left, many of them naturally coming to the Americas.

The moral and intellectual defects of Sicilian society are in part results of the economic difficulties, and in part the effect of bad customs introduced or maintained during the long period of Sicilian isolation from the rest of Europe. When, in 1860, Sicily was incorporated in the Italian kingdom, hardly a tenth of the population could read and write. On the completion of unity, elementary schools were founded everywhere; but, though education was free, the indigence of the peasants in some regions prevented them from taking full advantage of the opportunities offered.

Brigandage has never wholly disappeared although the true brigands haunt only the remote and more inaccessible mountains. In the west portion of the island law and order are not yet supreme. The most frequent crime is murder; violent assaults with infliction of serious wounds are also frequent.

This readiness to commit bloodshed is attributable first to the history of Sicily itself and the interminable civil wars forced on it, and second to the influence of the Mafia, a Sicilian secret society, whose organization and purposes much resemble those of the Italian Camorra.

In its crudest form the Mafia was organized brigandage, blended with the vendetta or family feud. When Napoleon expelled the king of Naples, and the Bourbon court took refuge in Sicily there was a large number of armed troops in the service of the Sicilian feudal nobility. Largely through the influence of England a constitution was granted the island in 1812, and with the destruction of feudalism most of the feudal troops became brigands.

Powerless to suppress them, the ruler Ferdinand organized the bandits into a rural police, and they soon established a reign of terror. Two classes grew up; the vast majority of the inhabitants, destitute, were glad to place themselves under the protection of the Mafia, while the active members shared the plunder.

Thus the Mafia became a loosely organized society with an unwritten code of ethics, which embodied the rules of the vendetta. The candidate for Mafia is pledged to resist law and defeat justice; and the member (Mafiuso) considers it dishonorable to have recourse to lawful authority to obtain redress for a wrong or a crime committed against him. He therefore hides the identity of the offender from the police, reserving vengeance for himself or his friends and dependents.

While the Mafia today is not a unit, a single organization, it exists as a state of mind, which can be termed a complex social phenomenon, the result of centuries of misgovernment.

In view of the seizure of land by the poverty-stricken Sicilian peasants a few days ago, and the fact that the police (often in collusion with Mafia) merely watched without interfering, it seems that law and order, as understood here, do not yet rule in Sicily; and this, with the other considerations, must be remembered in assuming any attitude toward the Sicilians who mistakenly transfer their home habits to this country.

Romance Adds to Vogue of France's New Saint

Concluded from page 11

Sulpice, who made the lucky contract with Vermare and who enjoys a monopoly of the reproductions. The accompanying photograph is of the statue in the Cathedral of Orleans; the hardly less famous replica made at the Pope's express request, for the Church of Saint Louis of France in Rome varies in several slight particulars from the original. But anyone saying the prayer already cited before either of these statues or a reproduction of either is "sure to have his wish granted"; so "everybody" says. And what, think you, may be the dearest wish of the good churchmen and royalists who are doing so much to spread the cult of Jeanne Darc?

The Andre Vermare Jeanne Darc

Far and beyond any such hierarchical or partisan designs must thoughtful observers place the significance for France of this immensely vital and growing interest in the nation's Virgin Liberatrice. The whole miracle of Jeanne's wonderful achievement in the events that crowded the four great months following her departure from Vaucouleurs on February 24, 1429, consisted in her success in imbuing the soldiers and the people with faith in themselves. She simply emblazoned in undying light on the pages of history a demonstration of the invincible might of honest and unwavering faith in the triumph of the right—and of action corresponding to that faith.

It is well that this national heroine, in the dawning of a new and brighter era for humanity through awakened democracy, should come to symbolize the real soul of France. In exalting and illuminating her renown, it may be that many will be reminded that Jeanne was a faithful daughter of the Church and the champion of a Bourbon king. But many more will be reminded and made to reflect on the fact that she was a daughter of the common people, that through her confidence and courage, the national cause which a royal weakling had betrayed and lost by his philandering was made victorious, that her reward from Church was an ignominious and cruel death and from king a cowardly desertion and abandonment to her fate. Despite the monarchists and the clericals, Jeanne is destined to become the symbol of Democracy in France and in all the world. Shakespeare's prediction that the day should come when "Joan the Virgin will be hailed as the patron saint of France" is being fulfilled before our eyes in larger measure than he dreamed.

The Case of the Farmer—As the Farmer Sees It

Concluded from page 6

of former years. First of all, this harvest is, with one exception, the largest in American history. The corn crop is the greatest yield ever known and represents four-fifths of the world's production. The rice yield is one-fourth greater than anything we have ever known before. The sugar beet crop is one-third larger than anything in the past. The sweet potato crop is the largest ever produced. The potato yield has been beaten just once and then by a very narrow margin. And the number of live stock on the farms exceeds by more than 18 millions the average number for the five years prior to the war. Yet this gigantic harvest, costing more to produce than any crop ever raised in the United States, is worth three billion dollars less to the farmer than the smaller crop of 1919.

This is the farmer's story as he tells it himself. These are the reasons he quotes for the drift to the city in such numbers that a recent survey showed 60,000 men and boys leaving the farms of Ohio during the fiscal year ending June 30, 1920. These are the causes, he says, for his dissatisfaction with conditions, for the growth of farm organizations and for the demands for special privileges.

But before he rests his case he asks attention for a moment to a final summing-up by his representative, the Secretary of Agriculture who has submitted to President Wilson within the month these portentous opinions:

"The very foundation of our nation—the stability of our agriculture—is threatened.

"The farmer must have, under ordinary conditions, a reasonable prospect of a fair return for his labor and the use of his capital.

"Everything possible must be done to prevent or at least to lessen the effect of the recurrence of conditions under which large numbers of farmers conduct their operations at a loss."

Are We to Poison the Life-blood of the Nation?

Concluded from page 10

of way to other measures as more important and, under the surface, quite determined opposition from elements that are determined that an unrestricted flow of the undesirable classes shall continue, caused this 20 years' delay in the literacy test. In 1906 a bill excluding persons who could not read or write English was debated but another law creating a bureau of immigration was enacted.

Finally, however, a literacy test was enacted. Popular opinion compelled some sort of action and Congress acted.

But the measure passed was travesty which has recently been publicly denounced by Frederick A. Wallis, Commissioner of Immigration at Ellis Island, as worthless. It was not until the measure finally became a law, that the identity of the interests, which had played the leading part in the years of committee-smothering, and newspaper denunciation of any attempt to exclude aspiring immigrants because their native land had denied them education, was revealed.

The literacy test as finally passed is a monument to legislative skill in innocuous but encouraging phrasing. Each immigrant must read 30 words or more, selected by the immigration authorities. But instead of reading them in English he is expressly permitted to choose any language, *including Hebrew or Yiddish.*

Never in any legislative enactment has bolder class legislation been perpetrated than this express sanction of one foreign race's tongue.

So far as the wording of the rest of the statute is concerned, there are no other languages in the world. French, German, Scandinavian, Spanish, Italian and two or three hundred other languages and dialects, pass unnoticed. But express indorsement is given by the American Congress to Yiddish.

But clearly as this governmental preference for Hebrews may seem to have been stated by this language, Jewish influences in Congress, then as now ably represented, were not satisfied. Still another provision was incorporated, one which provided that in case an immigrant was unable to pass the literacy test, still he might claim lawful admission to the United States if he proved that he was fleeing from a country in which religious persecution prevailed.

Such was the ending of 25 years of struggle in which the attacking forces finally won a title to a law enabling them to conserve America for Americans, while the defending forces insidiously wrote the language of the law so the immigration gates remained as wide open as ever.

In a sense, perhaps, the class legislation question should not be considered as a cause of present immigration troubles but rather as a constitutional barrier to the establishment of future safeguards. It is probably true that not until recently has the need been so patent of excluding persons because of their racial and social non-assimilability. The Chinese Exclusion Act was inspired rather by industrial fear of labor competition from persons educated to cheaper standards of living than by an understanding that the Chinese were racially unfit for American citizenship.

Now, however, the conditions in immigration have reached the point where the official report of the House Committee on Immigration recognizes the problem as one of race.

The extent of the present immigrant flood will be considered in the next article.

Training Animal Actors for the Pictures

By JOHN B. WALLACE

THE advent of the motion picture has opened up an entirely new field for the animal trainer. Some of the most interesting of the early pictures were those taken of wild animals in Africa and other countries. The men behind the pictures were not slow to sense the popularity of animals on the screen and as a result the animal actors now vie with the human stars. It was comparatively easy to train domestic animals such as dogs and horses to act before the camera. Elephants and camels also presented but little difficulty as they were seldom used except in their regular employment as beasts of burden to give local color to Oriental scenes. But when it came to the cat tribes such as lions, tigers and leopards, as Perlmutter says, this was something else again.

These animals are always dangerous no matter how well trained and accustomed to man they may be. It takes a man with great agility and a cast-iron nerve to handle them. Such a man is Curly Stecker, the animal director at Universal City and perhaps the greatest trainer of animal movie actors in the world.

Stecker is a young man in his early thirties. He was born in the copper country of Upper Michigan. When he was but a boy his parents died leaving him to the care of relatives. He was a high-spirited and most independent youth and when certain of his ideas were overruled by his guardians, he retaliated by running away with a hypnotist. He drifted from one traveling show to another until he finally found his forte in the menagerie of a circus.

When it was learned that he could handle wild animals his fortune was made. He was successively with Barnum & Bailey, Forepaugh and Ringlings. Then he went to work at the great Selig Zoo at Los Angeles and finally wound up in his present position with the Universal Film Company.

Stecker is a slender, wiry-built man with the steady gray eyes of the western plainsman. In fact he much more resembles the cowboy type than he does the conventional type of animal trainer, who is usually a foreigner with pompadour and waxed mustachios. He impresses the observer as a man who fears neither man nor beast but in whom the spirit of dare-deviltry is directed by a cool intelligence.

He was introduced to me as Curly Stecker. I asked him what his real given name was. He hesitated.

"Well, my folks christened me Algernon," he finally admitted.

"Now ain't that a swell name for a lion tamer?" he added plaintively.

Stecker is in charge of the most varied assortment of animals that can be imagined. Bears, lions, tigers, leopards, pumas, wolves, monkeys, camels, elephants are some of the wild specimens in the Universal menagerie while the domestic assortment embraces everything from pigs to ring-tailed doves. It is the largest menagerie on the Pacific Coast with the exception of the Selig Zoo. And every one of the animals takes part in film productions.

Stecker not only uses his animals in the Universal pictures but he is frequently called upon by the other studios, which do not maintain a menagerie. The day I visited him he had just returned with three lions from a two-hour engagement with another film company for which he received the neat sum of $250.

The collection of cats, as the lions and tigers are known among animal men, at the Universal does not compare in quantity with the enormous number of these jungle denizens at the Selig Zoo, which houses more than one hundred, but Stecker is ready to back them against any aggregation on earth in quality. Most of them he raised himself.

He has three four-year-old lions, out of the same litter, whom he calls Tom, Dick and Harry and of whom he is especially proud. They are what he terms man broke but are not yet trained enough for use in the pictures. Most of the film work he does with four six-year-old lions, two lions and two lionesses, although he has others whom he works occasionally.

He has a two-year-old lioness whom he raised on a bottle. She is as gentle as a kitten and idolizes Stecker. It is no unusual sight to see him leading her about the studio with nothing but a collar and chain. Needless to say these excursions are not very popular among the human actors who need no urging from their directors to register nervousness when Stecker appears with this immense beast in leash.

It is customary in some studios, in their jungle scenes where human actors and especially women are employed, to use an aged, toothless lion who would be incapable of doing damage if he so willed. But not in the scenes that Stecker directs. There is nothing moth-eaten about his lions. They are husky specimens in the prime of life. The sight of them crunching a horse's head or thigh, such as I saw them feeding upon, leaves no doubt in the mind of the spectator as to the condition of their teeth.

The filming of the scenes in which lions or tigers are used is done in an immense steel cage. The director who has charge of the production tells Stecker what he wants done and the animal trainer then takes charge of the scene directing both the human and animal actors. The back of the cage, which is provided with numerous exits in case of trouble, is fixed up to resemble a jungle, desert or whatever the location in which the scene is placed.

The lion or tiger is then taken into the cage and rehearsed over and over until it grasps what the trainer wishes it to do. Then the human actors are called in and the scene shot by the camera. It does not take much of an actor or actress to register fear with the knowledge that there is a four-hundred-pound lion or tiger prowling around behind them and for this reason some of the best acting is done in the animal scenes.

"What do you use, a whip or meat to train the cats in these scenes?" I asked Stecker.

"Sometimes both," he replied. "But most of all I rely upon their habit of obedience. The hardest thing is to get them to understand what I want them to do. After they once get that in their heads the rest is comparatively easy."

Curly Stecker's little daughter with a lapful of lion cubs. She draws $150 a week for acting with the animals although not yet three years of age.

Curly (A. C.) Stecker, the world's greatest animal trainer for motion pictures.

Joe Martin, the orang-outang, making a roar.

The smaller members of the cat family such as the pumas and leopards are much harder to work with than the lions. Tigers are also hard to train. The lions are the least treacherous and the most intelligent.

Stecker is never cruel to any of his animals. He never punishes an animal without just provocation. This can be readily seen by their attitude when he is about them. There is none of the cringing fear exhibited in the presence of some trainers. But he mixes kindness with firmness. When he tells an animal to do a thing he never lets up until he is obeyed.

Stecker has unusual success in raising lions. He has reared dozens of them and seldom loses one. A little incident showed me one of the reasons for this.

We were standing facing a wired inclosure in which were five baby lions that had just been weaned. While we were talking I noticed Stecker's eye roving over these cubs. Suddenly he called to an attendant.

"Those cubs look thin. Are you feeding them enough?" he inquired.

"I am keeping a pan of milk in front of them all the time, sir," the man replied, "besides meat."

"Well, put some eggs in their milk for a while and see if we can't bring them up," Stecker told him. "They ought to show more flesh than they are."

Another star of the Universal menagerie is Charley, the elephant, one of the largest in captivity. When we visited him, Charley was taking his daily drink through a hose. He much prefers this method of internal irrigation to any other and his little eyes twinkled with enjoyment as he squirted the water down his capacious throat. It is a dangerous moment for spectators, however, as it is Charley's idea of a good joke to turn the hose on anyone standing near.

When he had finished drinking Stecker called abruptly.

"Lie down, Charley."

Down went the immense hulk immediately.

"Roll over."

Up went the four ponderous legs in the air. It was a wonderful demonstration of the power of mind over matter to see this enormous pachyderm obey instantly the orders of the slight biped beside him.

Charley, however, is not always good-natured. He has gone bad and killed several of his attendants during his life. An experienced trainer can tell when an elephant is going bad as a rule and extra precautions are taken until his ugly spell is over.

The real star of the Universal menagerie, however, is Joe Martin, the orang-outang. No doubt those of my readers who are movie fans have seen this wonderful animal who shares with Teddy, the great Dane, the honor of being the most gifted animal actor on the screen.

Joe is now eight years old. Stecker got him when he was six months and has raised him and trained him. He is said to be the only orang-outang ever raised in captivity. Joe comes from the island of Borneo or Sumatra, I am not certain which. He belongs to the most intelligent of the family of great apes. In fact his intelligence is almost uncanny. He does everything but talk. Orang-outangs are very difficult to keep any length of time in captivity as they are of a melancholy temperament and usually pine away when kept alone. Therefore Stecker's feat in raising Joe is considered remarkable among animal men.

Joe seems to be of an ordinary cheerful disposition. He loves to play with anyone who comes about his cage. He will seize a stick or a piece of sacking and thrusting it through the bars will coax the bystander to attempt to take it away from him. It is some feat, too, to pull anything from his iron grip. I saw him drag a 200-pound man right up to the bars with a strip of jute sacking.

Joe is about the same size comparatively as an eight-year-old child. Orang-outangs keep about the same pace of growth as a human being and reach their fullest development about the age of twenty-five. They are also said to have about the same span of life as a human.

Their brain, while the most highly developed of any of the great ape family, does not grow in proportion to their body, however. Stecker says that Joe is as smart now as he will ever be.

"How on earth do you get him to do all the things he does in the pictures?" I asked his trainer.

"I do them first myself," Stecker explained. "Joe will watch me and then imitate my every action. Sometimes his attention will be distracted for a second and he will miss something. Then I will be compelled to repeat, but he seldom misses a cue. After a couple of rehearsals we are ready for the camera. Joe is actually easier to direct than the human actors."

The ape really seems to enjoy his stunts in front of the camera. He does a great deal of acting with children especially in the comedy pictures and he is right in his element when dressed up in boy's clothing.

Stecker's little girl and his three-year-old nephew work with Joe a great deal. Although he is no beauty, children do not seem to be the least bit afraid of him and he appears to enjoy their company more than he does that of adults. Incidentally it might be mentioned that these little tots draw a salary of $150 a week for acting with Joe.

Joe, himself, is a valuable animal. Stecker has refused a sum in excess of $20,000 for him and it is doubtful if twice that sum would buy him.

Most of the animals in the menagerie are used more for comedy films than they are for legitimate drama. The bears fit naturally in comedy films and even the lions are used considerably in this line. A great many of the animals such as wolves, and so on, are used to provide local color. Directors call for everything from porcupines to crocodiles and it keeps the menagerie attendants busy trying to supply them.

Invention That Saves Millions

By H. O. BISHOP

IT TOOK a youngster of 28 to put over an invention that will revolutionize the entrance and departure of vessels from harbors. From the time of Columbus down to the present day one of the most expensive problems of transportation has been the delay occasioned by heavy fogs compelling vessels to anchor outside of harbors or postpone the hour of sailing.

Earl C. Hanson, of Los Angeles, has outdone all the grizzled electrical inventors of the world by evolving a simple and ridiculously inexpensive arrangement whereby vessels can be piloted in or out of tortuous harbors.

Young Hanson's invention is so exceedingly simple that many electrical inventors are now kicking themselves for having overlooked the solution.

This fog taming contrivance consists of the laying of a cable in the center of a ship channel in bay or river. Through this cable is sent an electric current, which, through telephonic listening devices on board ship, can be heard sounds of a certain pitch that cannot possibly be mistaken for any other signal.

The man whose job is to steer a vessel in or out of a harbor prepares himself for that task by slipping a listening instrument over his head which in appearance is similar to that used by the "hello" girls at a switchboard. This hearing apparatus is attached by wires to the hull of the ship, thus making it possible to pick up the current from the cable lying on the bottom of the channel. The ship follows the course of the cable at full speed as though the sun were shining and the air clear. Any variation is immediately shown by visible indicators, which point in feet the distance from the cable. By the ear receivers the indicator may be confirmed at all times. Vessels that are going into port will use one cable and those leaving will use another. The sounds are different on each cable, making collisions impossible.

(C) U. & U.

EARL C. HANSON

To make it possible for the captain of a vessel at all times to know how far his boat has progressed, the inventor has placed lead insulations at a distance of every mile on the cable through which no sound can pass, and by which the pilot checks the exact location of the boat.

According to the experts of the United States Navy, who have made exhaustive tests, Mr. Hanson's invention is thoroughly reliable in all conditions.

A feature of the invention is the trivial cost of operation. To furnish the necessary electrical current for a cable into New York Harbor from Sandy Hook to the steamship docks, about 20 miles, will cost ten cents an hour—about equal to lighting an ordinary residence.

The cost of equipping the channel into New York with a "Hanson" cable, including cost of cable and all labor for laying same, would be about $100,000. That sum, of course, sinks into insignificance when it is realized that the buoys alone that mark the winding course of the channel from Sandy Hook to New York cost $1,500,000.

When harbors are fitted with the Hanson invention ocean traffic will be placed on a par with that of high-class railway systems, as far as regularity of arrival and departure schedules of boats is concerned.

Vessels ofttimes are delayed at harbors a third of the time required to cross the ocean. It is authoritatively stated that every hour of fog delay to one of the larger liners costs $4,000. A delay of 24 hours, therefore, means approximately $100,000 loss. Add to this the wages of the longshoremen who sit idly on the docks waiting for the fog to clear; the idleness of thousands of freight cars held for the same cause, and the idleness of employes at points of freight destination, and consequent loss of business, and some idea may be obtained of the present "fog bill" America pays every year. It must be remembered that the same expense and loss of time is incurred when outgoing steamers are held by fog.

Corporations and individuals engaged in coastwise traffic between Washington, Oregon and California points on the Pacific Coast, and the more numerous ports on the Atlantic Coast from Maine to Florida and from Florida across the Gulf of Mexico to New Orleans and Galveston, are just as deeply interested in the prompt adoption of this simple and inexpensive plan to overcome delays by fogs as are the trans-Atlantic concerns.

It is considered probable that Congress will take early action in equipping all American harbors with the invention of Mr. Hanson's.

Why and Because

Why is the fee given to a servant called a "tip"?

Because the letters which compose the word are the initials of "to insure promptness," an inscription on the money boxes which used to be in every tavern. Into these the traveler dropped his coin, and the staff, as a whole, shared the benefit. This custom still prevails in some places, but in the United States we give the fee to the particular individual who serves us.

Why is a married woman living apart from her husband called a "grass widow"?

Because she is a widow by courtesy or "grace." The term "grace widow," which is from the French, means any woman separated from her husband otherwise than by death. The French pronunciation of "grace" is the same as our "grass," which explains the corruption to "grass widow."

Why do widows wear caps?

Because when the Romans were in England they used to shave their heads as a sign of mourning, and as woman could not let herself be seen with a bald head, she made herself a pretty cap. Though the necessity for it has long since passed away, the cap still remains.

Why do many persons, half in jest and half in earnest, knock on wood as a preventive of misfortune?

Because there was at one time a general belief that trees and humanity were allied in close bonds of union, and that certain trees had healing qualities. It was customary for a person afflicted with disease to take a woolen string of three colors, and with his right hand tie his left loosely to the limb of a tree, then slip it out and hasten homeward without casting a glance back, the belief being that the disease was transferred to the tree by touching it. Thus from a tree it has become common practice to touch any article made of wood to ward off misfortune.

Why do we wear heels on our shoes?

Because the sandal-like footgear of olden times was not adapted to horseback riding, and when the high boots were introduced heels were put on for the purpose of giving the foot a good hold on the stirrup.

Why do brides wear veils at the marriage ceremony?

Because it was the Anglo-Saxon custom to perform the nuptial ceremony under a square piece of cloth held at each corner by a tall man, the object being to hide the bride's blushes. From hiding both bride and bridegroom the custom changed and the bride only was shielded from the inquisitive gaze, and the veil was substituted for the cloth.

Why do persons sigh?

Because an interval of several seconds, during which the walls of the chest remain rigid and cause oxygen starvation, always follows moments of mental disquietude; when nature demands her supply of oxygen the deep inhalation occurs, the expiration after which we call a sigh.

Why, when a person displays a cowardly spirit, do we say that he "shows the white feather"?

Because in the days when cockfighting was the popular sport a white feather in the tail of a bird was taken as evidence of inferior breeding and courage and the term became common among the slang phrases of the period as applied to persons who showed a lack of courage.

Why do physicians place at the head of prescriptions the letter R, with a line through the tail?

Because the letter represents the Latin word recipe, the imperative of which means "take," and the little dart (originally a thunderbolt) is the symbol of Jove or the Latin god Jupiter, which invests the writer with authority. The sign, therefore, means, "By my authority, take this," but properly translated is, "By Jupiter, take this."

Why are traveling boxes called trunks?

Because in the days of William the Conqueror boxes for carrying money and valuables were made in a very primitive fashion, the lids being simply half the trunk of a tree hollowed out; hence the name. In an old Kentish church in England there is to be seen such a trunk, which is said to be the one in which the Conqueror kept the money with which he paid his soldiers.

The Origin of Sports

By FRANK DORRANCE HOPLEY

BASEBALL

GAMES in which balls are used have been played by nearly every nation, for ages. Over 4,000 years ago, in the 12th Egyptian dynasty, historians tell us, a Coptic artist sculptured on the temple of Beni Hassan, human figures throwing and catching balls. A ball with a leather cover, used in games played on the Nile over forty centuries ago, may be seen in the British Museum in London.

In the sixteenth century the game of ball was very popular among the nobility in England, France and Italy. The Chinese have also played ball, in various ways, for centuries, and the game has also, with many variations, been played in Japan.

A commission of national ball players, ex-Senators and sportsmen was formed in 1907 to look into the origin of baseball in America. Their report was made, dated December 30 of that year. In it they unanimously declared:

First, that baseball had its origin in the United States.

Second, that the first scheme for playing it, according to the best evidence obtainable to date, was devised by Abner Doubleday, at Cooperstown, New York, in 1839.

Mr. A. G. Spalding, in his book, "America's National Game," gives a statement of Mr. A. G. Mills, one of the commission, as follows:

"In the days when Abner Doubleday attended school in Cooperstown, it was a common thing for two dozen or more of the schoolboys to join in a game of ball. Serious collisions between the players in attempting to catch the batted ball were frequent, and injury due to this cause or to the practice of putting out the runner by hitting him with the ball often occurred. It appears, for this reason, perhaps, that Doubleday provided for eleven men on a side instead of nine."

The theory of evolution of the game of baseball, as advanced by Mr. Spalding, is an interesting one. He says:

"However historians may differ as to the origin of the American National Game, all must agree that the sport had as its foundation a Ball. Without that as its base, the superstructure of the grandest pastime ever devised by man would never have been erected.

"In order to realize on the ball it is necessary to have some one put it in motion. Placing the ball in the hands of the first lad who happens along, we may be assured he will do the rest. And he does.

"'I'll tell you what we will do,' says Tom. 'I'll throw the ball against the barn. You get that old axe handle over there and strike it as it comes back. If you miss the ball and I catch it, you're out; but if you hit the ball and can run and touch the barn before I can get the ball and hit you with it, you count one. If I hit you with the ball before you get back to your place, you're out.'

"They try it, find it works well, and the third stage of the game has developed into Barn Ball, with two boys, a bat and a ball.

"Again it happens that it is not sometimes altogether convenient to play Barn Ball. Tom and Dick are coming from school with Harry. They tell him about their game of ball and the fun there is in it.

"'I'll tell you what we can do,' says Tom. 'You and I, Dick, will throw and catch, just as we did the other day, and Harry can stand between us with the club and try to hit the ball. If he misses and either of us catches the ball before it hits the ground, or on the first bound, he is out and the fellow that catches the ball takes the club.

"'If he hits the ball far enough to get to that rock over there and back again before one of us gets the ball, he counts one tally, but if one of us hits him with the ball, he is out.'

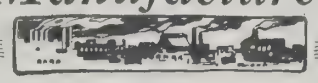
"Thus the game of One Old Cat was born, and the fourth step has been evolved, with three boys, a bat, a ball and a base."

The final step in the evolution of the game came in 1839; as has before been stated, when Abner Doubleday adopted the diamond-shaped field, and the other points of play, which were also adopted by the Knickerbocker Baseball Club in New York, upon its organization in 1845. "Then it was," Mr. Spalding says, "that the number of players participating in the game was limited to eighteen—nine on a side; a pitcher, a catcher, a short-stop, first, second and third basemen, right, center and left fielders, four bases, bat and ball, and was the game of baseball substantially as played today.

"The organization of the Knickerbocker Baseball Club was the beginning of a most important era in the history of the game, for it was the first recorded movement of that kind. For more than thirty years the Knickerbocker Club maintained an amateur organization and, as such, was a model in every respect.

"In 1846 a party of players styling themselves 'The New York Nine' issued a challenge to the Knickerbocker to play a match for a dinner, of course. The event came off in Hoboken on June 19. The contest was a very one-sided affair. The challengers won by a score of 23 to 1, only four innings being necessary to score the 23 runs.

"It was five years before the Knickerbocker Club engaged in another baseball match. In June, 1851, the Washingtons challenged the Knickerbockers who, having profited by their defeat by the New York Nine, had greatly improved their game. They appeared upon the ground in new uniforms, composed of blue trousers, white shirts and straw hats, creating a profound sensation. The score of this game was 21 to 11 in favor of the Knickerbockers, for eight innings."



The Three Arts

Agriculture

Manufacture

Transportation

A Chinese philosopher once wrote, "The well-being of the people is like a tree—agriculture is its root; manufacture and commerce are its branches and life. If the root is injured, the leaves fall, the branches break, and the tree dies."

The Dairymen's League of New York will try out an experiment in co-operation under which the farmer members will pool the proceeds of their milk.

Ohio sugar beet growers are organizing a state association through which all future dealings with the sugar refineries will be carried on.

Chicory, which is grown as a vegetable and forage crop in Europe, has become a troublesome weed in the United States.

The Department of Agriculture is ready to lend the motion picture, "Modern Concrete Road Construction," for use before schools, churches and good roads organizations.

The Bureau of Markets of the Department of Agriculture has a number of experienced men who are at the disposal of farmers wishing to organize co-operative shipping and marketing associations.

The agricultural department of Mexico is planning to establish 16 schools in places where they are most needed. Students will specialize in farm work, particularly that work having to do with irrigation.

Between 80,000,000 and 100,000,000 acres of land in the United States are too wet for cultivation, being in swamps or subject to periodical overflows.

The San Joaquin Valley raisin crop for 1919 was sold for $50,000,000.

In Alaska, potatoes planted the first week in June mature about September eleventh and yield between 7,000 to 9,000 pounds an acre. The government experiment station produced cabbages which weighed eight to twelve pounds while sugar beets grown at Matanuska contained from fourteen to seventeen per cent sugar.

Eighty-nine per cent of the foreign trade of the United States is Atlantic Coast business.

In Russia the wheat-bearing soil tapped by the Trans-Siberian Railway is greater than the total acreage of the United States, Argentina and Canada combined. During the war Siberia produced nearly four hundred million bushels of wheat. Ten thousand carloads of beans were dumped at Harbin more than two years ago and they were still there the first part of 1920 because no railroads or vessels were available to carry the produce to the markets of the world.

There were 3,373 strikes and lockouts involving 4,112,507 workers during 1919. Estimates of the losses sustained by the workers are too uncertain to be of value as statistics.

It is estimated, in a report made to the Chamber of Commerce of the United States, that for twelve manufacturing establishments employing 40,000 men, the loss annually from discharging workers and employing substitutes was $831,000.

The 30,000,000 industrial workers in the United States lose on an average nine days a year through sickness. The monetary loss to the workers is $700,000,000. The loss in productive effort amounts to 270,000,000 days a year.

The government Forest Products Laboratory estimates that there is a daily loss to manufacturers and shippers of $500,000, caused by faulty containers and improper packing.

Between four and five million Christmas trees are used in the United States every year.

Farmers of North Carolina, being unable to sell their wool at what they consider a fair price, have had it made into blankets and will sell the blankets.

Eighteen billion dollars represents the natural wealth of Canada.

Mexico has announced plans to encourage the building of a merchant marine.

Canada's potato crop averages 176.5 bushels to the acre this year against 153.5 bushels last year. The total yield was 138,527,000 bushels.

Unless some of the members reverse themselves their expressions indicate that Congress will do nothing to retard the falling price movement of farm products.

Senator-elect Heflin, of Alabama, has informed a congressional committee that the decline in the price of cotton has cost planters $1,250,000,000.

Late reports from the Southern Hemisphere forecast favorable prospects for crops of 1920-1921.

Co-operative marketing of wool through the county agent gave growers of Williamson County, Texas, 60 cents a pound at a time when local buyers were offering but 35 cents.

Overstocking of the ranges in New Mexico is said to have caused cattle losses varying from 16.7 to 35 per cent.

Twelve thousand and thirty tons of coal were discharged from the collier Ulysses at the Cristobal Coaling Plant of the Panama Canal in 15 hours and 25 minutes.

Increased business in Canada has necessitated the stringing of thousands of miles of new telegraph wires.

Twenty-nine American vessels arrived in London in November, the largest number ever registered at that port in any one month.

With six per cent of the world's population and seven per cent of its land, the United States produces 52 per cent of the world's coal, 20 per cent of the world's gold, 25 per cent of the world's wheat, 40 per cent of the world's iron and steel, 40 per cent of the world's lead, 40 per cent of the world's silver, 50 per cent of the world's zinc, 60 per cent of the world's aluminum, 60 per cent of the world's oil, 60 per cent of the world's cotton, 75 per cent of the world's corn, 85 per cent of the world's automobiles, 60 per cent of the world's copper and operates 40 per cent of the railroads of the world.

Only ten per cent of the business firms in the United States keep accurate cost systems as against 90 per cent in Germany.

Shoe factories in Auburn, Maine, which have been running half time have returned to full schedule.

A farmers' co-operative organization in Saskatchewan handled nearly 40,000,000 bushels of wheat during the year ending July 31, 1920. Two hundred and ninety-four elevators were operated.

Soft coal production for the week ending December 4 broke all records for 1920. The mines loaded 232,340 cars. Net production was estimated to be 12,727,000 tons.

A Michigan company is meeting with success in the cultivation of cranberries. Four hundred acres of marsh land are being brought under cultivation.

California farmers have taken over a new two-million-dollar terminal elevator at Oakland.

More than $54,000 worth of food was preserved last season by 1,250 girl members of food clubs organized and conducted by Ohio State University.

The Department of Agriculture urges that farmers take advantage of the winter season to make an inventory which will determine their actual financial worth. The department will furnish plans for making up these lists.

The National Sheep and Wool Bureau of America has announced it will support a plan to bring about a year's embargo on the importation of wool.

The Harvard Committee on Economic Research says, "We find no reason to change the forecast of October 15 that we 'have passed the time in the business cycle when a financial panic would have occurred, if we were to have one.'"

The census shows that a majority of this country's people live in cities and towns of more than 2,500 population.

California Honey Producers' Co-operative Exchange is putting honey up in small containers and shipping carload lots east.

The Interstate Commerce Commission has upheld the rates charged for refrigeration and transportation of butter, eggs, poultry and cheese. The ruling was in the case of the National Poultry, Butter and Egg Association against the Baltimore & Ohio, Southwestern Railroad and others.

The Department of Agriculture has notified a number of fertilizer manufacturers that prices quoted for mixed fertilizer for the spring trade are too high and that "manufacturers who exact unjust or unreasonable profit will be subject to prosecution."

If the government's shipping program is carried out the United States will probably have as much shipping in 1922 as all other countries combined, excepting Great Britain.

Six hundred cars of wheat were reported passing east through Regina, Canada, every 24 hours, the third week of December.

Two million six hundred forty-eight thousand acres are now being irrigated by water from government projects. During 1919 the value of crops grown on lands within government reclamation projects was $25,000,000 greater than the total of $125,000,000 expended on all projects constructed up to the close of the last fiscal year.

Wool stored in Louisville warehouses will be sent to Austria where the mills are closed down for lack of raw material. The finished cloth will then be returned to this country to be placed on sale. It is thought that the tariff and transportation cost will be nullified by the cheap labor in Austria. This movement will be undertaken by the Kentucky Farm Bureau Federation. About 600,000 pounds of raw wool can be disposed of in this manner.

Rice threshing in Louisiana is practically complete at this time. One plant in the irrigation district tabulated the yield received and found in an area of 9,500 acres in cultivation a yield of 6.9 bags an acre.

Bradstreet reported 1,085 failures with $39,751,859 liabilities in the United States for November. This was the largest number since January, 1918.

Forty per cent of Canadian shipyards are said to be idle.

Government chemists say that sweet potatoes make a superior table and cooking syrup. The Department of Agriculture will furnish instructions on application.

A recent survey of 32,515 Illinois farms shows that unless horse breeding be resumed on a basis twice as extensive as at present, there will be a pronounced shortage of good farm horses within the next few years.

The farming of wild fur-bearing animals and the establishment of large sanctuary tracts is urged by the Department of Agriculture as the only sure means of preserving the fur supply.

According to Lloyds, the United States built 2,009,495 tons of new ships to replace losses of the war, Great Britain built 1,234,911 tons and Japan 414,957 tons.

The state highway commissioner of Connecticut has announced the restriction of motor trucks to loads of 20,000 pounds.

There are more than 1,000 known varieties of wheat.

Australia has engaged an entomological expert to spend a year in the cactus regions of Arizona in search of insects which will assist in eradicating the cactus.

URBANA ILL

Briefly Told

During October immigrant arrivals at the port of New York exceeded departures by 49,072. For the ten completed months reported on, the excess of arrivals over departures was 193,305.

The Seattle Chamber of Commerce is in receipt of a letter from an enterprising Japanese who wishes to purchase brewing machinery of American brewery owners. He states that "breweries of this country must be totally wounded by the law of temperance."

A single county in Oregon has a larger territory than that covered by the entire state of Massachusetts and contains 9,883 square miles.

The American Quakers are furnishing one hot meal a day to 650,000 German children and nursing mothers in the sector occupied by the American troops of occupation.

Naval divers recently recovered $77,000 worth of opium from Honolulu harbor.

An anti-alcohol society has been formed by the women of Mexico City who plan to form similar societies throughout the republic.

The fact that the salmon will return unerringly to its home stream has been demonstrated by the effort to transplant salmon from the Pacific Coast to the waters of Maine. The Penobscot River was planted with salmon from the West and it was to the Penobscot and to that river alone that the adult fish returned to spawn.

The only open slave market in the world is located in the holy city of Wazzan, Morocco. The slaves are brought to Wazzan by caravan from parts of the country still unexplored.

Accident insurance companies declare that home is really the most dangerous place in the world, as twenty-five per cent of all disabling accidents are incurred there.

Secretary Colby is asking for an appropriation of $25,000 for providing protection for the original copies of the Declaration of Independence and the Constitution which are in grave danger from fire or other mishap.

Because of the diversity in railway gauges in use in the southern republics of South America the traveler is compelled to change cars at nearly every boundary line.

A married machinist of Wrentham, Massachusetts, a sergeant of the United States Marines, is heir to a small island south of the Philippines, he having been adopted by the former sultan of the island. The willed estate consists of several pearl fisheries, groves of cocoanut palms and a harem. The War Department has referred his claim to the Bureau of Insular Affairs.

During the fiscal year 1920 the printing bill for all publications issued by the Department of Commerce was $425,370.75.

President Wilson was awarded the Nobel peace prize which carries with it a grant of $40,000, which is one-fifth of the annual interest on about $9,000,000 bequeathed for that purpose by a Swedish scientist. Theodore Roosevelt and Elihu Root are the only other Americans who have received the prize.

A piece of discarded auto tire tubing cemented to the sole of the shoe will, it is said, outwear two leather half soles. This is easily done by roughing the leather with rasp or scraper, applying three coats of patch cement and a layer of cushion stock, to which is applied the cemented tubing as in the patching of a tube on the road.

Two-thirds of Canada's forests have been destroyed by fire in 75 years. At the present rate of consumption the amount of timber burned would have supplied the entire world for 450 years and represents a loss of a billion dollars.

In November 24,308 men were accepted for enlistment in the regular army, breaking the record for peace-time recruiting.

Pension disbursements for the fiscal year 1920 aggregated $213,295,314, a decrease of about $9,000,000 from last year.

The United States manufactured $80,000,000 worth of the $100,000,000 worth of toys sold in this country.

A London wallpaper manufacturer suffers considerable damage from sparrows. The sparrows flock down on the dark blue, covered pulp used in the manufacture of paper and are drowned. It is believed that the color attracts them. The pulp has no oder and there is a canal near by which provides them with drinking water.

Utah has 25,662 farms.

German motion picture producers are warring on American-made films smuggled into Germany since the armistice. The American films are for the most part sensational wild west features several years old which were sold so cheaply that certain theatrical proprietors were able to exhibit them underselling their competitors who handled German films on which royalties have been paid.

A New England prohibition enforcement director refused to prosecute a sick man in whose home he found a still and moonshine whisky at the bedside. The man was a victim of tuberculosis and needed stimulant to keep him alive.

The peace commission cost the United States $1,651,191.

Cooks are to be had without advertising in Port au Prince, Haiti. Most of them earn $1.50 a week with an additional 6 cents a day for food for themselves and family.

All the religious and civic organizations of Lexington, Kentucky, are united in a fight to suppress the habit of cursing and swearing on the streets, in the hotel lobbies, cafés and other public places of that city.

A kitten crawled inside the rim of a large flywheel in a mill at Burlington, Nebraska, and fell asleep. The machinery was set in motion and the wheel whirred for nine hours. When the machinery was stopped for the night the kitten was still alive although it had traveled the equivalent of 600 miles.

In certain parts of Russia mail is carried by buffaloes. This animal is picked for the service because of his very flat feet, which enable him to travel where horses would sink.

Through the efforts of agents and demonstrators of the University of Kentucky women of the mountains of Eastern Kentucky are rapidly being trained to cook better food, make practical clothing and observe sanitation and health rules. The women are intensely interested, many of them riding horseback through the mountains, taking a lunch, to attend the meetings.

The French district of the Landes is a country of black forests and far-spreading deserts of white sand and swamps. The inhabitants, who are for the most part shepherds, find it necessary because of the nature of the country to walk on stilts while tending their flocks.

The farmers of Serbia make their own liquor from the fruit of the plum. These plums are shaken into barrels where they are left one month and the liquor distilled from the mash. During plum time one can see two or three peasants sitting by their fires watching the distilling process.

His majesty Pu-yi, of Hsuan-tung, the last "son of heaven," came to the throne of China in 1908 when he was two years of age. The only European who ever saw him is his tutor, Mr. R. F. Johnson.

Camel steak was recently served in Paris. The taste is similar to that of horse meat but easier to digest.

Members of the feline tribe do not drive their nails in the bark of trees to sharpen them as is sometimes supposed. A male tiger will jump high up against a tree, tearing down a large piece of bark, to show his mate how strong and athletic he is. The leopard advertises his prowess by laying his killed prey high up on the branches as an offering.

In Japan hundreds of the natives throw themselves from the rocks to the cataract of Kezon, in Mikko, to die amid the beautiful rural scenery. Others jump from the edge of the crater of the Asam Volcano. A society has been formed to convince the aspirants of self-destruction of the foolishness of their intentions.

There are 6,000,000 children born every year in China.

Federal prohibition enforcement officials are going to place the following sign on hundreds of Chicago saloons and cabarets: "Beware. Any person purchasing liquor here is subject to prosecution along with the owner of the saloon."

The Price of THE DEARBORN INDEPENDENT Is Now $1.50 a Year

Many Men of Many Minds

Laurence La Tourette Driggs.—Legislation and regulation of air navigation must be deeply and immediately considered, by the aviators, by Congress and by the public. Wisely controlled, aviation will prove a wonderful boon to commerce and civilization as a whole. Federal legislation is immediately required, establishing public air highways, licensing air pilots, defining negligence and fixing responsibility so that both the aviator and the private citizen may know his legal rights.

Harry F. Sinclair.—Colleges do not educate—they help men to educate themselves. Man power is the most important asset. The accident prevention campaign not only lessens the drain upon man power, but also, by stimulating thought, adds to the effectiveness of the man power preserved.

King Constantine, of Greece.—I, upon whose family crest stands the device "the law of the people is my power," ever have had at heart the interest of the people by whom I am now recalled, by their express and indisputable will, to rule.

Governor Riggs, of Alaska.—Laws should govern, instead of revocable regulations, but where there must be regulations, such regulations should be promulgated by authority located within the territory and not 4,000 miles away.

Corinne Lowe.—Among all the new Americans the Hebrew from Russian Poland has perhaps caused the greatest disquiet to those interested in immigration. Reason for this disquiet is found in the fact that the exodus from this section is mightier than ever before. From Warsaw comes the report that between five hundred and one thousand Jews daily receive passport visés for the United States, a rate which threatens the arrival of a quarter of a million of this people within the year—and that through Warsaw alone.

Polish Jews Cause Disquiet Because of Their Numbers

Sir Campbell Stuart.—Anglo-American friendship is based on deep and firm foundations; on a community of race and a community of ideals.

Cato Sells.—The Indian's transformation from a game hunter and wanderer to a settled landholder and home builder is everywhere evident.

Representative Albert Johnson.—The exodus from Central Europe is at once serious and dangerous. The State Department knows this and has given me enough reports from its consular officers to serve as a warning. The present rush brings too many who are anti-government and anti-God. It is the most undesirable that ever came to the United States.

Eugene Manlove Rhodes.—Frontiersmen on frontiers never do anything at all resembling, as to motive, method or result, those things which frontiersmen do in films.

Thomas W. Lamont.—At present Siberia is under the Soviet Government, but sovietism there is not of the Red type that it has been in Moscow; it is a sober, rather restrained movement. Today it would appear perfectly possible for Americans to trade safely in Siberia.

George Pattullo.—Probably no country in Europe was so strike-ridden as Germany during 1919. When a population reaches the desperate state of mind summed up in "What's the use, anyhow?" it is ripe for agitation. There were agitators in plenty, and striking soon became one of the favorite German pastimes.

Ashmun Brown.—An increase in Congress is like increasing the number of directors of the plant, each new director claiming as much power as his fellow. Such a policy in industrial life would not be tolerated.

Bozeman Bulger.—The wild fowls' sense of geography, of distance and of speed is a constant source of wonder to those interested in their habits. That they are able to judge the distance and time their flight so as to reach that spot at approximately the same time after an absence of twelve months, seems *incredible*, but it is true.

Albert W. Atwood.—I have sat at dinner tables and listened to men tear from the modern system of industry, to their own satisfaction, every shred of economic or moral justification. Yet the food they ate, the chairs and tables, the costly china and linen, their suits, soft-lined shirts, pink neckties—all these were products of the system in which they could see nothing worth saving from the bombs of revolution.

Forest Crissey.—A bond salesman who handles only the soundest of securities and sells them to wage workers and men on small salaries looks to me very much like a missionary of good citizenship. But be sure to deal only with that kind of man representing a sound, conservative, established concern.

Raymond Francis Yates.—Signal engineering is one of the newer specialized branches of railroad engineering. The problem of safe, reliable automatic signaling grew with our railroad transportation systems and today thousands of men trained in this work are employed in the design, construction and maintenance of signal installations.

Wayne B. Wheeler.—The end of the liquor supply of this country is in sight.

Tasker H. Bliss.—If nations are armed to the limit against each other and each knows that the armament of the other has no use against any other than himself, can we not all see that when one approaches its limit and believes the other to be capable of further expansion, war, without warning, is almost inevitable?

Brander Matthews.—A true dialect is never a corruption—quite the contrary. As a rose has been called "only a cabbage with a college education," so we may describe standard speech as only a dialect which has enjoyed the advantages of post-graduate instruction.

Josephus Daniels.—This country should not put a general embargo upon oil, but there is a crying need for such restrictions as will not jeopardize the future needs of the merchant marine and the navy.

David Lloyd George.—War teaches us that preservation of our essential industries is as important a part of national defense as the maintenance of an army or navy.

Floyd W. Parsons.—The United States should extend the same encouragement to the new settlers of Alaska that was given by Russia to the people who settled Siberia and that is now being extended by Canada to those who are peopling its western provinces.

James Duncan.—Wherever there is the appearance of practicable co-operation, there also will be found the elements of human and business betterment. Never in our history was there more need for such practicable consideration of co-operative methods. Employers should be ready to meet representatives of workmen to discuss proposed changes in mutual intercourse and thorough understanding. We live in a time when we should all work together for the greatest possible production.

A. Barton Hepburn.—The condition of the country is very much better because the mental attitude of the public toward the business situation has changed. There has been a marked improvement, mainly psychological. People had been buying everything and anything, under the conviction that they could sell at a profit, and have been brought to realize that purchases must be made with discretion and with a view to supplying the public good. I have for the past year been very much afraid of a commercial cataclysm. I no longer have such fear. The situation will work out logically and safely unless complicated by conditions in Europe.

Industrial Changes Will Benefit, Belief of Banker

Rear Admiral Caspar F. Goodrich, U. S. N.—The United States Navy, as its name implies, belongs to the people of the United States and to no one else. If anything is wrong with our navy the fault lies ultimately with its owners, the people of the United States, because they take little or no interest in it.

Dr. Henry W. Thurston.—Until the potentialities of all children are developed, the school cannot be said to be successful. To do all this successfully, the environmental influence in the lives of the children must be studied and thoroughly understood by the school.

Martin T. Baldwin.—A tariff act is a verbal woodpile, harboring many a dark ambiguity. The clearing of its obscurities is not only an interesting intellectual and legal problem, but is also at times a matter of great financial and industrial importance.

Jean Herbette.—Two classes in Germany are in very real distress. These are the city middle classes and the wage earners. The farmers, whether landlords or peasants, are quite well off; for which the country has reason to congratulate itself.

John A. Gade.—Few tragedies equal that of the Russian nation today and no people is worthier of understanding and sympathy. After fighting for the Allied cause, they had left on the battlefield more dead than France, Great Britain and Germany together, and yet today Russia is no longer even mentioned as an Ally, its military effort is sneered at or reviled by those who should in justice feel for her the deepest gratitude.

Herbert Adams Gibbons.—If our government intends to give active aid in the establishment of peace and reconstruction, we cannot pursue a different policy in the Baltic from that of Great Britain. We must recognize and seek to strengthen the Baltic Sea republics, incidentally looking around for opportunities for trade in Eastern Europe. If we are going to disinterest ourselves in the politics of Europe, and look for a field for our diplomatic and commercial activities elsewhere, let us stop putting in our oar where we do not intend to row.

Policy in Baltic Should Be That of Great Britain

Walter Locke.—The farmer is on his way. I do not think that anything can prevent his setting up and maintaining, whether by economic action or political, or both, a force of his own to balance the economic power of private business and industry.

Guglielmo Ferrero.—So long as the war endured, the people obeyed and believed. Now that the war is ended and the people recognize how they were misled, they resist, rebel, and will no longer obey.

Lynn Haines.—Government is the most vital element in human life. It means more, not in sentiment, but in dollars and cents, to every individual than does his or her business.

Senator F. M. Simmons.—The tenant classes, and they are numerous, who raise their crops largely under mortgage or lien, have in most instances had to turn over their whole crops to the fertilizer and supply men and are left practically without anything to start upon the next crop. The landlord, who generally indorses the obligations of his tenants for fertilizer and supplies, in many instances finds the liability thus incurred exceeds his rents.

T. J. Woofter, Jr.—The responsibility of the labor leader for inter-racial peace arises from the fact that unions have shown more active prejudice to Negro labor than any other northern group, and the fact that these cases of discrimination have been widely discussed among the Negroes and have so galled them that they are very suspicious of motives of unions.

Herbert S. Weet.—The trend in education is logically toward a reorganization of the whole course of study with reference not so much to subjects as to the normal development of the individual child.

David Scott Hanchett.—The activities of a boys' club worker in a settlement are pivotal. No one is so discerning or so alert to puncture sham as the street gamin. It is these Arabs of the streets who, flocking to the neighborhood house seeking a hang-out for the gang, bring with them innate possibilities for untold good to the community or, under wrong stimulus, for being enemies—Apaches of society.

THE KING OF FOXES

Fur Farming on the Fox Ranches of Prince Edward Island

By J. A. STEVENSON

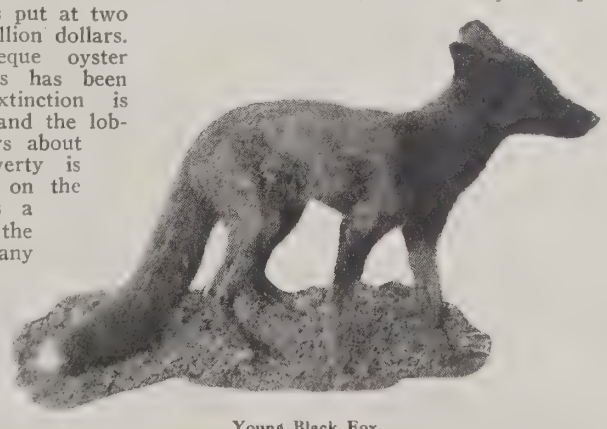
THE little Canadian province of Prince Edward Island is known as the Garden of the Dominion. Nestling in the sheltered conclave formed by the southern coast of the Gulf of St. Lawrence and protected from the Atlantic by the Cape Breton promontory and Newfoundland, its quiet is never seriously ruffled by ocean storms. Continually bathed by ozone-laden sea air its climate knows neither extreme heat nor cold and is pleasant, healthy and invigorating. Its summers are delightfully cool and its winters are enjoyable and bracing without discomfort.

Possessing no large mountains or forests and lying low in the gulf, it gives a promise of monotony to the approaching visitor. But closer investigation sweeps away this impression. Clumps of trees, lovely groves, undulating hills covered with the greenest of grass, rich meadows, fat corn lands, abundant flocks and comfortable farmhouses, churches and villages give it an appearance of well-being and prosperity. It is 130 miles in length and its width varies from two to 30 miles while its area is 2,184 square miles with a population of about 93,000.

It is cultivated from end to end, ninety per cent of its whole area being classed as "possible farm land." The chief industry is agriculture and the well-kept farms and good buildings testify to the fertility of the soil and the skill of its cultivators. There is no specialization in its field agriculture but the favorite lines are dairying, stock raising and gardening of vegetables and fruit.

Prince Edward Island has the distinction of being the only province of Canada which produces sufficient food for its own requirements. Not only does it achieve this but the value of the surplus product exported is more than sufficient to pay for all its other purchases.

Fish abound in the bays and rivers of the island and around its shores and the annual value of the catch is put at two and three-quarter million dollars. The famous Malpeque oyster which in late years has been threatened with extinction is found on the coast and the lobster industry employs about 5,000 persons. Poverty is practically unknown on the island and there is a minimum of crime; the jails rarely have many occupants. While there are some Irish on the island the main racial ingredients are Highland Scotch and French-Canadian, and the island has acquired a reputation for sending forth both to Canada and the United States more than an ordinary proportion of able men, including Franklin K. Lane, lately Secretary of the Interior, and President Schurman, of Cornell.



Critics have, however, accused Prince Edward Island of being a hopeless backwater where enterprise was unknown and energy an unnecessary quality but the charge has been belied in a most convincing way by the success with which the islanders have organized a very novel and profitable industry. They have brought scientific fur farming to a greater pitch of perfection than any other community on the globe. As far as industries go it may be reckoned young. In a way it dates back as far as 1887, but it is only in the last decade that it has become one of the staple activities to obtain general recognition. Just as the diamond is peerless among precious stones so the fur of the silver fox holds an assured preeminence among furs. The description, silver fox, is decidedly misleading, for it is the trade name for the skin of the black fox, the term silver being derived from the presence of glistening white and gray hairs among the black jet. The brush to be perfect should have a tip of pure white. On account of the luster and richness of the fur it is always fashionable in the feminine world and the demand is unlimited. But twenty years ago it looked as if this fur would soon be so scarce as to be beyond the purses of all save a favored few. Such survivors of the silver fox tribe as were left had retreated to the fastnesses of the Arctic North and the Hudson Bay Company had fixed a standard price of $1,000 for a prime pelt. In 1912 a single first-class skin brought $1,400.

In the eighties the rarity of this fur had set the mind of a trapper, Charlie Dalton, now Sir Charles Dalton and a native of Prince Edward Island, thinking. He had been a hunter ever since he was a boy and his earliest recollections concerned the setting of a trap. He foresaw the day when the silver fox would be practically impossible to secure and conceived the notion of bringing scientific knowledge and industrial organization to bear upon the problem and raising foxes upon an intensive system as if they were goats or rabbits. The more he digested the idea the more he became convinced of its feasibility. He realized that trappers, who had obtained litters of young black fox cubs and had tried to rear them, had usually failed, but he attributed their failure to lack of knowledge and proper environment. So he set himself to study the habits of the tribe and to this end acquired a collection of ordinary red foxes whose habits and needs he closely studied for some years. About 1890 he learned that a trapper friend on Anticosti Island across the gulf had two pairs of silver foxes in captivity. He bought them and installed them in special quarters which he had prepared on his farm at Tignish.

Young Red Fox

Meanwhile, it happened that another trapper called Robert Doulton had been reasoning in a similar strain and had begun preliminary studies with some silver gray animals. One day Dalton, having heard of Doulton's experiment, paid the latter a visit and was allowed to see his animals. There ensued a prolonged discussion of the problem involved, the prospects of the industry, and the best methods to pursue. The result was a decision to pool their resources and form a partnership for the commercial farming of the silver fox. They set up a large wire pen on Savage Island where Doulton had his ranch and commenced scientific breeding in good earnest. The original two pairs of silver foxes bought by Dalton produced four pups, which were successfully reared and it was proved that given congenial conditions the silver fox could be domesticated successfully.

Young Black Fox

The stock thus established was reinforced by a pair of young foxes found in a den and successfully dug out. The firm soon found themselves in possession of a considerable number of foxes and able to kill some of the older ones for their pelts, which found a profitable disposal. Neighbors who had jeered at this "shiftless fooling with wild foxes" became keenly interested in the new enterprise. Others began to embark in fox farming operations and met with gratifying success. The inevitable result followed, a boom in fox farming developed, and people who had not the remotest connection with trapping or the fur business began to start ranches. Expansion went on rapidly, especially when fox furs from the island began to realize large prices on the London market. The pioneers of the industry found themselves besieged with applications to buy pups and the demand for stock caused a virtual cessation of pelt production for the time being. Companies were floated to embark on the business and there was heavy speculation in their shares in the years preceding the war.

Full Black Fox

In 1912 there were 277 fox ranches on the island, of which 143 belonged to companies. The total value of their stock was then estimated at $10,000,000, twenty-five per cent in excess of the value of all the other live stock held by the island farmers. At that time $20,000 was not an uncommon price to pay for a pair of first-rate pups and in one case the high-water mark of $35,000 was reached. The profits on one small farm capitalized at $10,000 enabled a dividend of 500 per cent to be distributed one year. But the inflation of values was too great and the boom could not last. It had begun to collapse before the war and its outbreak, closing as it speedily did the European market for furs, hastened the end. A great deal of money was lost but the effect has been to put the industry in a healthy condition. While high prices are still obtainable for a pair of good breeders the industry is now on a pelt basis and, under good management, is extremely remunerative.

Contrary to early opinion the silver fox has not proved difficult to domesticate and farm. The chief requisites are patience, shrewdness and sympathy with the animal, coupled with the knack of noting its peculiarities and humoring them. The human factor plays a very large part in success. The average ranch contains from one to five acres and as far as possible the natural environment of the fox is reproduced. The favorite location is in a piece of thinned bush where mixed hard and soft woods will both shade from the summer heat and allow an early thaw of snow and ice and whose elevation permits good drainage. As the fox is extremely sensitive to noise, the farm should be removed as far as possible from roads and houses. The ranch is usually enclosed by a double wall of board and wire netting with the inner wall some distance from the outer boundary. The latter is designed to keep out disturbing intruders and also to prevent the escape of stray foxes who may get out of their pens. The inner space is divided into pens, and there is a double wall of wire between each. The best-sized pen for a single male measures 20 by 50 feet and 40 by 50 feet is considered necessary for a breeding pen. Between each row of pens there is a path eight feet wide with doors opening into each pen. The wire netting must be at least ten feet high while on the one hand, it is sunk deep into the ground to defeat burrowing and on the other is bent over at right angles for a foot at least to prevent climbing or jumping over. Inside the pen is a small wooden kennel, 8 by 10 feet, provided with a ridge roof, entrance to which is through a wooden tunnel. The house is divided into two compartments each 4 feet by 8. It is lined with cork, chips, chaff or similar material.

The average fox has a life of from 11 to 15 years and it is not uncommon for a rancher to start with a pair of pups costing perhaps $10,000 and find himself at the end of four years with a dozen pairs and an annual output of 40 pelts. As the young grow up, the older animals are killed so that there is no real depreciation. The chief food consists of horseflesh, tripe, coarse fish, and so on, which would otherwise be wasted and it is supplemented by biscuits, bread, vegetables, oatmeal, berries and eggs. A special fox biscuit factory has been started to cater for the industry. The general practice is to feed twice a day at regular hours.

The external organization of the industry has steadily gone ahead. The leading fox

CHANGE OF ADDRESS

To receive your copy without interruption, please observe the following:

1. Notify us at least two weeks in advance.
2. Give both *old* and *new* address.
3. Write clearly.

I Resolve

THIS is the time of resolutions; the time when we determine that we will give up all sorts of things that are harmful to us; and that we will do during the coming year a great many things that we promised ourselves last January we would do in 1920, and which, somehow, we didn't do at all.

There is a saying that "resolutions are made only to be broken" and perhaps that may be true in some cases. But, although many of our resolutions are not carried out, it is good for a man and woman, once a year at least, to resolve to do great things. It shows we are not satisfied with what we have been doing in the past, and dissatisfaction is always the road to progress. No one who sits down in smug complacence ever gets very far in any department of life. No one who has said "what's the use of making resolutions, I'll only break them," has advanced very far in physical, mental or spiritual power.

To resolve is to be like an eaglet, trying its wings; to resolve is to be as the athlete, training for the race; to resolve is to be like the scientist, groping in the ether for a new and startling revelation.

The eaglet sometimes falls to the ground with a broken wing; the athlete may not always win the marathon; the scientist may never discover all that he desired or hoped for, yet if the resolve to try had never been made, none of the three would have accomplished anything.

To make a resolution at the beginning of the year that the 365 days that are to come shall be the best, and the brightest and more filled with love and service than any previous year, enlarges the soul and gives one a firmer grip on the verities of life.

It was Charlotte Perkins Stetson who once wrote these resolutions:

"I RESOLVE

To keep my health;
To do my work;
To live;
To see to it I grow, and gain, and give;
Never to look behind me for an hour;
To wait in weakness, and to walk in power;
But always fronting onward to the light,
Robbed, starved, defeated, fallen, wide-astray—
On, with what strength I have,
Back to the way."

There is nothing in these resolutions that any man or woman may not resolve and stick to during the coming year.

Try it, you who read this, and see if the year of our Lord, One thousand, nine hundred and twenty-one will not be the biggest, the happiest, and the most glorious year that you have ever known.

Honest Labels for Woolens

THERE is before Congress a bill which if made a law will compel manufacturers of woolen goods to label their products in such a manner that the public will have no difficulty in determining whether a piece of cloth is made of virgin wool or contains shoddy.

Before the war the term "all wool" meant exactly what it implies. Then certain gentlemen in authority conceived the idea of cutting up scraps of wool, "reclaiming" they called it, and mixing it with virgin wool in the soldiers' uniforms. There was an investigation by Congress and one of the results was the establishment of the fact that goods containing shoddy have less durability than those made of virgin wool.

There are laws which protect the public against the improper labeling of food and drugs. There are laws which make it an offense to misbrand gold or silver. "Sterling" stands for genuine silver just as "14K" stands for a definite, known quality of gold.

No one doubts the value of these laws and there should be no question of the advisability of protecting woolens with a similar measure. When the public buys a piece of goods it has a right to know whether it is getting pure wool or cheap shoddy and the last ones to deny this will be honest manufacturers.

More Propaganda

IT WILL probably be just as well if the readers of the daily press will take the "blue law" yarns with a grain of salt. Dr. Crafts, who has been responsible for more reforms than any other one man in the United States and who would know about plans to put the old Sabbath observance measures into effect if anybody does, says nothing of the kind is contemplated.

The agitation over the supposed plot to enforce the customs of three hundred years ago makes one think, avers Dr. Wilbur Crafts, of the colored minister who, in announcing his text, stated, "I will divide my discourse into two parts. Firstly, I will deal with that what am in the text and secondly I will deal with those things what am not in the text. And, brethren, I will deal with the second part first."

Anyone who is at all acquainted with the caliber of the men who led the last great reform—the adoption of national prohibition—will at once absolve them of responsibility for such a scheme. If they are nothing else they are at least too smart politically to show such bad judgment. And since there is nothing in "the text" of the recognized reform organizations that even remotely resembles the drastic blue law program, it becomes necessary to look elsewhere for the authorship of the wild stories.

If we direct our course by the light of past events we will probably end our search at the lair of the press agents for the liquor interests. They are very ingenious gentlemen, these advocates of personal liberty, and they have a bag full of tricks. Some time ago, it may be remembered, they were charged with having originated and circulated the report that the prohibition organizations were about to attempt a campaign which would make the use of tobacco a felony. If their aim is to discredit prohibition by associating it with the most radical theories and theorists, they overshoot the mark when they make their tales as wild as these. And if they hope by chance to rush prohibition leaders into the mistake of supporting some such movement as they outline, they are wrong again.

The prohibition leaders will not be rushed. They are quite content with holding what they have. They even have a sense of humor. Verily, they are wise men.

Mr. Harding Wears Well

MR. HARDING proved during his presidential campaign that he was a good talker. It cannot be said that he was eloquent, for he was not. But he used straightforward language. He talked in simple words and phrases and his audience understood and liked it.

This, of course, was good but it was by no means unusual. There are plenty of plain talkers in the country and a good many of them find their way into public office. A much more valuable, and a far rarer quality is the faculty of listening well—and Mr. Harding has it.

It is not unusual for candidates for office to promise to call the best minds of the country to their aid, yet few of them perform their pledge after they are elected. Mr. Harding, however, having made such a promise is keeping it. He is calling in the leaders of the nation's thought one at a time, from Elihu Root to William Jennings Bryan, and there is no denying the fact that in so doing he has pleased the nation exceedingly.

To do Mr. Harding full justice it must be said that this is not the first time, since his election, that he has shown a soundness of judgment which has been very pleasing to the public. With all his modesty and gentleness he has handled several situations in a manner which indicates that "the velvet scabbard holds a sword of steel."

The Tariff Again

THE old wheel horses of the Lower House of Congress ought to be and probably are in their glory, for the tariff is up again and they can tinker to their hearts' delight.

To these old veterans of a hundred battles the tariff is the one legislative problem that is worthy of real consideration. To them it is ever the paramount issue. Let others fool away their time trying to decide how large the army and navy shall be, let those who will worry over a league of nations. For their part they will stick strictly to their knitting and will talk about nothing but tariff.

The tariff tinkers went into eclipse during the war but the ink was scarcely dry on the armistice papers before they were giving out statements to the effect that the only road to reconstruction was tariff revision. And now they are dragging out all the old catch lines that were used in McKinley's day and are talking about saving the American farmer, building up American industries and protecting the American public. Two recent instances of the way they work come to mind.

The emergency measure framed in the closing days of the year provided heavy duties on over twenty farm products and was lauded as the salvation of the American farmer. Absolute quiet was maintained, however, on the fact that the net result will be to increase the cost of living to the public at large.

The public has also been solemnly assured by the high protectionists that the only way to assure the continued prosperity of American industry is to build a high tariff wall around the country and thus keep out the cheap products of Europe. Nothing much is said, however, about keeping out cheap European labor or of the fact that if we refuse Europe a market for her goods we will make it impossible for her ever to repay the ten billion dollars which she owes us.

No wonder the average citizen finds debates over the tariff confusing and cannot square the statements of the tariff tinkers with what to him appears to be the simplest and most elementary laws. He, poor direct soul, does not charge off anything for the sake of pleasing the farmers nor of winning the votes of labor, nor for satisfying industry. He does not even understand that one must sacrifice something to partisan principles and political pride.

But if the average citizen cannot understand the tariff, perhaps he can find a grain of comfort in the thought that there need no longer be any worry about *getting* back to normalcy. With Congress all heated up and quarreling over the tariff we *are* back.

The Price of Ignorance

P. P. CLAXTON, Commissioner of Education, gives the public considerable food for thought when he states that the greatest tax paid in the United States is that paid for ignorance. The losses which we incur because we fail through ignorance to do things as well as they might be done, he says, amounts annually to twenty billion dollars. To put it more graphically, we could pay for our share in the World War with what we waste every 12 months.

Our sin—for waste is sin—is all the greater because it could be avoided so easily. We need but to give the various educational departments of the government the support they deserve to wipe out the greater share of this enormous loss and yet our policy toward them is invariably a niggardly one.

Comparatively few people, it seems, appreciate the great work which is being done in this country by government scientists. For instance, there are few who know that investigators of the Department of Agriculture have just returned from a 9,000-mile journey through Africa where they went in search of food plants which could be adapted to the United States. Probably few know that it was the government scientists who first introduced durum wheat. Egyptian cotton, alfalfa, rice, navel oranges and the sorghums and after demonstrating their adaptability induced the farmers to accept them.

Nor is this the only branch of endeavor which has profited by government discoveries, for there is scarcely a department of commerce or science which has not learned to do things better or more economically through the advice of these Federal bodies.

How much more could be accomplished may perhaps be realized when it is stated that out of the tremendous government budget of 1920, these highly important departments received about one cent out of every dollar of national revenue.

We must economize, of course, but there is room to question the wisdom of any budget which does not acknowledge the worth of the educational work which the government is doing and provide for developing all its possibilities.

Mr. Ford's Page

IT IS a New Year, but there will be an astonishing number of old things about it. Its newness is undeniable, but its familiar lines are unmistakable. One would find it not an easy task to separate the newness from the oldness during the year. Yet the Year itself is new. Every experience that shall befall us during its 52 weeks, will also be new. It may be familiar, known, but still it will be new. Life is made up of a repetition of similar experiences, with now and then an unfamiliar one to stand out as a landmark.

It is a new cycle of time. A new breadth, as it were, woven in the Loom, raw material of which to make what we will. That—the time cycle—at least so far as we are concerned, is new.

But it is raw material. The fully made-up year is the finished product. What it may be like we have just had the opportunity to see. A made-up year has just passed out of the Time-factory, to take its place among the other 1919 years of this era.

It is not a particularly flattering product, the year we have just finished. Stand it up, turn it around, and examine it, and it doesn't stand scrutiny very well. It appears to be decidedly amateurish and very much botched. In no single particular is it standardized. There are spots here and there upon it which would seem to indicate that moments came to the makers when they really had an idea of making something—but then they seem to have resumed their aimless puttering again.

No; as we look at the year upon which history has just affixed the label "1920" we are not willing that it should serve as a sample year. It isn't good enough.

The reason is, of course, simple to understand. The human race has not been very long in the business of Year-Making. There are only 1920 credited to the production record of the Christian Era, and that is a comparatively small number.

"But after making 1920 years, a perfect year ought to be turned out now and then," might appear to be a natural objection.

That brings us to the "labor turnover." The same people have not been engaged in making the entire 1920 years. There is an immense turnover of humanity every generation. People appear on the earth, pass a few careless apprentice years, and then seriously try—some of them—to do a man's work upon the making of the Years. But hardly have they learned the rudiments when a new shift comes, new and unaccustomed hands take up the work. The years run on, they come out precisely at the end of December on schedule time, but they do not show on their human side the marks of unity and mastery.

The year is after all but a small bit in the mosaic of the Age, and perhaps we shall be better able to judge it from a perspective which enables us to see the whole pattern; but even so, we are right in feeling that the whole mosaic of the age would be better, if each bit were better made.

Inevitably, next December, we shall have to deliver to the Builder of the Age another year, and it is natural to wonder what it may turn out to be.

What have we *new* about the year? Very little, except the time. That has never been used before, will never be used again.

But the old things that troop along into the New Year are very numerous. It is almost like the same old family moving into a new house; very little is changed after all.

It is the same old Earth, for one thing. And that is a genuine benefit. We know what the Earth will do. We know what we can absolutely depend on it to do. That is a great saving of time, for, if this year the human race had to begin all over again and by careful and costly experiment find out the powers of the Earth, the year would be almost empty.

But we know that the soil will radiate the sun's warmth in spring, that moisture and heat will create chemical conditions out of which man's food will come; we know that the earth will produce lumber and ores and material for clothing. We have learned all that. It is no longer a question of anxious uncertainty. Take up a handful of soil; in it are the elements of food, clothing, shelter for all mankind.

Then, we bring into the New Year the same old necessity of getting busy in order to set the soil doing for us the things we need. And it is remarkable, when you begin to put the soil at work, how many men you have to put at work too. If it is the era of "the man with the hoe," somebody has to make the hoe. And then somebody must take part of the product of the hoe's work to the man who helped make the hoe; and before you know it you have started the Great Sisterhood of Arts in motion—Agriculture, Manufacture, Transportation.

It may be a better Agriculture—exchanging the hoe for a tractor; it may be a better Manufacture—exchanging the burden from men to machines; it may be a better Transportation—leaving the hand-drawn or ox-drawn cart for the motor vehicle on land or in air; but in spite of improvement it is the same raising, making and carrying of what we need. It is work in its primary and essential forms.

We are also taking with us into the New Year the old-fashioned rule that what a man earns is his own, and no one has the right to take it unjustly from him. It is a very good rule; without the stability it offers, society would be as impossible as agriculture would be if there were no certainty about the order of the seasons or the operations of nature. Many men try to change this rule; they want what another man has earned, and they want to take it in the name of "society." But people who have learned this fundamental wisdom and justice of the relation between personal and property rights, never unlearn it.

It would be very hopeful, however, if we could get some new things for the New Year. We begin work on 1921 under strange conditions. The Earth is just what it always was. Human needs, which are the mainspring of all activity, are just what they always were. Material and men, the essential components of civilization, are both here in abundance, and yet there is a stoppage of activity.

Why? Because, apparently, something has happened to—what? To the soil? No. To men? No. To material resources? No. But something has happened to that quantity known as Money. They are making it "less" in the country, "contracting the currency," they call it. They are trying to make money more nearly measure up with the gold. Why? Because "they" have decreed that Gold is the basis of Money.

There is not enough gold to go around. Even as a measure of wealth, there is not enough gold to equal in figures the actual wealth. There is not enough gold in existence to pay the interest on the war debts accumulated by the nations during the last few centuries. To make business wait on gold is like making the passenger traffic of a main line dependent on the facilities of a local branch with one small train a day. If gold did the work it might be as acceptable as anything else; but it doesn't.

It would be a splendid thing if in 1921 some financier, whose business is making prosperity instead of making money, should show us the way to avoid having business tied up for money, when all the elements of business are here. Financiers have been very skillful in devising schemes which draw all the money to New York; now for a financier who shall devise a scheme to keep the money in the local communities where it is needed! As long as we must have money, let us have it under a system where it helps instead of hinders, where it keeps men in their jobs instead of letting them out. Such a plan would make 1921 a great year. It would help the millions who are not financiers, but who are always under the pressure of our present financial system.

THE New Year will have to conform to some very old rules which will continue because they are good rules. But that is no reason why the New Year should put up with old mistakes and abuses. At its very threshold we find every element of prosperity present—the need, the men, the materials—and yet because of money conditions there is a slow-up. Either there ought to be enough money to carry the essential activities of the country, or a curtailment of money's power to stop things. There is more wealth than money; and as long as real wealth is compelled to wait on the fictitious wealth which is measured in gold, troubles will continue. Here is a task for 1921.

These mail trucks sound a note of progress. But they are not helping to develop the rural mails. When photographed, they were on their way to Porto Rico, where they are now in use. The inset is of James I. Blakslee, Fourth Assistant Postmaster-General, who has much of pertinence to say.

Our "Pork-Laden" Rural Mail System

By AARON HARDY ULM

"REVISE the R. F. D. mail system in my district!" exclaimed a Congressman to a Post Office Department official recently. "It's impossible, sir, impossible. Why, the system as it now operates brings to my district $210,000 a year and it all stays there. A revision might reduce the sum as well as the number of persons it now provides with jobs. If made, I'd probably lose my job, so nothing in the way of revision is going to be done so far as I can help it."

"But suppose the patrons of the rural mails in your district were given better service as the result of an intelligent readjustment of the system?" the official asked.

"That wouldn't get me a half dozen votes," the Congressman replied. "But the resentment that would be aroused among those whose personal interests would suffer because of the changes made would be sufficient to prevent my re-election. Hence I am opposed to any disturbance of the status quo."

The status quo with regard to the rural free delivery branch of the United States postal system is not such as to fill anyone who analyzes it with enthusiasm, despite the fact that our vast network of R. F. D. routes represents one of the most creditable national achievements.

Operation of the system as now constituted entails, according to Post Office Department officials, an utterly useless waste of from ten to twenty millions of taxpayers' dollars a year. But that is an insignificant item in the system's total of shortcomings. For example—

Considerably less mail is handled by the average R. F. D. carrier than by the average city mail carrier, though the first must use a vehicle while the last must lug his load on his back.

So far as the Post Office Department knows not a single automobile truck is used in carrying mail on an R. F. D. route in the United States.

In late years there has been virtually no improvement in the types of vehicles used by R. F. D. carriers in handling mail.

Instead of encouraging the use of motor cars, and all that they could mean by way of dispatch and volume of mail handled, on R. F. D. routes, motorization is actually discouraged.

Hence instead of the R. F. D. mail system being an incentive to the building of first-class highways, in the truly modern sense, it tends if anything to discourage the building of really up-to-date roadways.

Instead of a premium being put on the true development and growth of the rural mails and their full adaptation to the needs of rural residents, growth, substantially, is penalized.

Therefore, the mails, which should be a medium of incalculable benefit to farmers, are utilized by farmers to less than ten per cent of existing capacity.

All of which finds illustration in the following startling fact:

Although the parcel post was established at the behest and for the benefit of the rural population, it is used almost exclusively by and for the benefit of town and city people. Slightly less than five per cent of all parcel post matter passing through the mails is distributed on or originates from rural free delivery territory. And four-fifths of that constitutes business going from town or city into the country, which means that the producers of foodstuffs make scarce use at all of the fine advantages which the parcel facilities afford them, presumably, for distributing their products.

While it is entirely practicable for the average R. F. D. carrier to handle from 1,800 to 2,000 pounds of mail a day—provided his route lies along roads that make the use of first-class equipment possible—the average carrier handles less than 75 pounds a day. And only 24 pounds of that is fourth-class or parcel post mail.

This means that the operation of the rural mails, as at present constituted, involves a tremendous waste of man power, vehicle power, and opportunities for economic distribution of the necessaries of life.

"There are 60,000 employes of the postal service who traverse 1,400,000 miles of highways, through producing territory, every day," says James I. Blakslee, who, as Fourth Assistant Postmaster-General, has devoted most of his energies during the last four years toward efforts to adapt the mails to the needs of producers and consumers. "If each individual carrier would transport 2,000 pounds, or one ton, the total transported would amount to 120,000,000 pounds a month. As the average consumption per man, woman and child, is about two pounds a day, this quantity would feed approximately 60,000,000 people, or two-thirds of our entire population."

Three main obstacles are in the way of that achievement, says Mr. Blakslee: the highways, the vehicles and the postage rates.

Excepting a small percentage of cases it is now impossible for the average carrier to transport a ton of freight on the roadways he must use, except in fair weather and then generally with difficulty.

That obstacle is being overcome more rapidly than heretofore but not so rapidly as should be the case. The Federal Government, under its authority to develop post roads, is now contributing about $100,000,000 a year to the construction of highways.

"Under the present system of compensation," adds Mr. Blakslee, "it would be impossible for 43,000 of the 60,000 carriers to purchase and maintain the character of equipment necessary to convey two thousand pounds of food daily even for a portion of the year."

And the postage rates, he says, in some cases are too high in proportion to the selling value of articles of food.

But those obstacles, however they may count against the fullest development of the rural mails, don't explain the wide margin—something like 95 per cent—between what is and what, under the best conditions, might be done.

In fact, with the obstacles as they are, only a small portion of immediately possible business is now carried on via the rural mails.

This declaration is proved by what is now actually done on many individual routes and in many sections of the country, which, however, are glaring exceptions to the general rule.

On the average R. F. D. route there are now handled about 7,500 pieces of mail, all kinds, a month. There lies before the writer a résume of business done on 54 select routes in 14 different states, on each of which there are handled more than 10,000 pieces of mail a month. The list begins with the record of a route out of Phoenix, Arizona. It has a length of 25.5 miles, which the carrier manages to traverse in three hours and nine minutes' time. But he has to spend nearly six and a half hours in the post office, routing his mail, which means that he gives a total of nine hours and 35 minutes each day to his job. He receives $1,830 a year salary, out of which he must provide and

Did You Know—

That the parcel post, created for the benefit of and at the behest of the rural population, is used almost wholly for urban business?

That instead of the rural mail system that on the whole prevails encouraging the use of the parcel post by farmers, its growth as a facility for distributing food is virtually penalized?

That the R. F. D. carrier who handles the most mail usually nets the least money from his job?

That the incentive therefore is for R. F. D. carriers to hold down and discourage the development of mail business?

That, as far as the Post Office Department knows, there isn't a single automobile truck used for hauling mail on a single R. F. D. route in the United States?

That on only 840 out of 43,410 R. F. D. routes is the use of any kind of motor vehicle required?

That the operation of the R. F. D. mails involves a subsidy of about $70,000,000, of which $10,000,000 to $20,000,000, according to postal experts, is utterly wasted, and could be saved by an intelligent revision that would greatly improve the service rendered?

maintain his equipment. The list ends, by graduation, with the record of a route 26.25 miles long, out of Hayward, Wisconsin. The mail handled averages 10,269 pieces a month. The carrier spends three hours and one minute in the office and two hours and six minutes on the road, making five hours and seven minutes devoted daily to his job. He receives a salary of $1,860, or $30 a year more than the carrier out of Phoenix who handles nearly twice as much mail and devotes nearly twice as much time to the handling. But both of the two routes are way above the average and if all the margins were no worse there would probably be no ground for complaint. But the margin of difference between the business handled and the compensation given for the operation of those two routes is insignificant as compared with others that exist.

Out of Mt. Washington, Missouri, there is operated a route 24¼ miles long, on which the carrier distributes 53,769 pieces of mail, on the average, each month, or 2,068 pieces during each working day. The carrier works from 5 a. m., until 5 p. m., and is paid $1,800 a year.

Not long ago the department learned of a route, issuing from a town in Georgia, that the carrier covered usually in one and a half hours a day. He was paid $2,000 a year. In that and other like cases the department does what it can to increase the work of the carrier by enlarging his route.

But, under the restrictions governing the operation of the R. F. D. mails, the routes cannot always be rearranged so as to place the work upon them on anything like par with other routes that pay no more—often less—and involve much more work.

Compare the route out of Mt. Washington, Missouri, with the following ones, taken at random, from compilations based on business done during the month of July this year:

Route 1 out of Brinson, Missouri: 2,598 pieces of mail handled a month; carrier devotes an average of four hours and nine minutes to the work; covers 23.75 miles and is paid $1,728 a year.

Route 3 out of Sadieville, Kentucky: 3,886 pieces of mail handled a month; carrier devotes five hours and nine minutes a day to duty of attending route; covers 25.84 miles and is paid $1,860 a year.

Though scores of cases like them could be given, the two cases are in some respects extremes. But they come nearer representing the average R. F. D. route than do the ones out of Phoenix, Arizona, Hayward, Wisconsin, or Mt. Washington, Missouri.

Everything else being equal, which route would you rather serve—one that would take all your working time, or one that would allow one-half or more of the day to attend some private business—one on which you would have to have a costly vehicle or one that could be served from a motorcycle? The answer is obvious.

The carrier with an easily handled route would be a fool if he built up its business to the point whereby it could not be so easily handled; for in either case, under the present system, his pay is the same—aye, equipment requirements usually cause his net pay to decline as business grows.

Hence there is no incentive for a carrier building up business on his route; quite the contrary. Increased business means for him more work, and bigger deductions from his salary for equipment and its upkeep; and, unless it comes about through extending the length of his route, with no possibility of extra allowance to take care of the added burden.

The kind of increased business that would add most to the burden of the carrier is that involving fourth-class or parcel post matter, for with it bulk and weight are the prime factors. Thus while it is to the interest of the carrier to hold all business down to the lowest minimum compatible with the existence of the route, it is especially to his advantage to prevent the development of parcel post business. Invariably, as is not the case with other classes of mail, a large volume of parcel post matter means more substantial equipment than the average carrier feels that he should be called on to provide.

It is doubtful if any other class of government employes can wield as much political influence and power as the R. F. D. carriers, by reason of their peculiar situation, possess. Invariably, they are first-class men, attentive to their work, accommodating to their patrons, and in every way personally likable. Each comes in daily and ingratiating contact with a large number of people who are out of intimate contact with general affairs. Acting concertedly, as they may do for they are well organized, they can give a Congressman or Senator more trouble than he may fear from any other group of constituents. Influenced by the pressure of circumstances, if nothing more, the average member of Congress is very attentive to the wishes of the rural carriers among his constituents.

"I attribute my continuance in Congress more to the close attention I give to matters having to do with the rural mails, especially those having to do with the interests of the carriers and small postmasters, than to any other feature of my work in Washington," said a Congressman to the writer only recently."

Congressional tenderness for R. F. D. carriers is shown by how they have fared in the matter of salary increases. Beginning with the establishment of the first permanent routes, the base pay, in 1897, was $300 a year. Since that time not more than three out of a dozen Congresses have failed to add to the salaries of carriers, who now receive a base pay of $1,800 a year. No other class of government employe has had anything like such treatment in the way of salary increases, and at none of the varying rates allowed during the last tweny-three years has the department had serious difficulty in getting capable carriers for the R. F. D. jobs.

Let it be said, however, that the pay on the whole is not excessive; in a great many cases it is yet entirely too low, even niggardly. Though it involves what is tantamount to a subsidy of $70,000,000 on R. F. D. mail service, the expenditure is entirely justified, *per se*, by the benefits to all the country from the general distribution of information the R. F. D.'s make possible.

It is not on the maintenance of the R. F. D. system, whatever the monetary cost to taxpayers who do not use it, that gives cause for complaint; it is the fact that the benefits and savings that the expenditure makes possible are realized upon to only an inexcusably small extent.

This is due, say Post Office Department experts, to the faulty way by which the expenditure is distributed. And the faulty way, say they, is attributable to the restrictions imposed by Congress on the postal service in regard to the expenditure. For example:

"You need not worry about motor routes interfering with your services," a Congressman said in a circular letter to the R. F. D. carriers in his district during a political campaign a few years ago.

The import of his statement is found in the congressional restriction on the establishment of rural routes on which the use of motor cars may be required.

While the Post Office Department may establish an old style horse-drawn route on its own motion anywhere, it cannot set up a motor route without the consent of a majority of the patrons to be served. That sounds very democratic, but there is a subtle joker in the restriction, which is solely to impede progress wherever it may interfere with the interests of individuals.

Naturally the development of roads and the increase of population necessary to make a motor rural route practicable take place in territory already served by the old style R. F. D. routes. It is easy for a carrier who can use a motor for ten months or more of the year to serve about twice the territory and patrons as the one who depends on a horse-drawn vehicle. The maximum length of a horse-drawn route is fixed by law at 36 miles. The minimum length of a motor rural route is 50 miles. The department, for some congressional reason by no means obvious, cannot set up any kind of route of a length between 36 and 50 miles. The establishment of a 50-mile or more motor route generally means the consolidation of two horse-drawn routes into one or three into two. Hence somebody invariably loses a job. There you are—that's the joker in the seemingly good old-fashioned democratic requirement that no patron of the R. F. D. mails shall be forced, against his wishes, to get his mail from a motor car instead of a buggy, light wagon, or a horse's back. It is a sorry man who as carrier can't get the majority of his patrons to withhold their names from a petition that may mean the loss of his job.

Hence, though this is the age of motorization and the horse is disappearing even from the fields (see United States Census reports now being issued) the use of motor cars is required by the government on only 840 out of 43,470 R. F. D. mail routes now in operation. And the number hasn't increased for several years.

For years the Post Office Department has urged Congress to permit the fundamentals of the entire system to be changed. What it has asked is that a fixed sum, as at present, be appropriated for the support of the rural mails and that its distribution be left in large part to the department. Instead of a uniform salary being fixed for carriers, regardless of their difficulties and the service each may render, Congress has been urged to fix a minimum wage below which no salary can go, and then to let further compensation be based on mileage covered, the equipment used and the business handled. Such an arrangement would make for the steady growth of the rural mails.

Take the Mt. Washington, Missouri route, heretofore referred to. During the month that there was distributed thereon 53,769 pieces of mail, only 170 pieces of parcel post mail were delivered on and not a single piece was taken up for shipment from the route. Yet the route runs through a rich, producing section contiguous to Kansas City, where there are a half-million consumers taxed heavily for the excessive cost of distributing food, some of which they could get from the nearly 3,000 producers on the rural route in question as easily as a letter may pass between them.

Realizing the possibilities of those 3,000 producers dealing, via the mails, directly with Kansas City consumers, the Post Office Department twice changed the source of the route from the suburb of Mt. Washington to a sub-station of the Kansas City Post Office. The change involved a shift of only a few miles.

But the carrier evidently didn't want to live in Kansas City, and the postmaster at Mt. Washington, whose income probably was reduced because of the loss of the business that arose on the route, didn't like the shift. Hence on each occasion such a row was kicked up that the department was forced to restore the status of the route. The people along the route evidently backed up the carrier and the postmaster.

With the route running from Kansas City, a patron might ship a 50-pound case of eggs directly to a Kansas City consumer at a cost of 29 cents. When the route originated from Mt. Washington the charge on the same shipment was 54 cents. Like differences prevailed on other parcel post matter passing between patrons of the route and Kansas City. But the patrons were not interested in that, because they were accustomed to making virtually no use of the parcel post privilege. And from the figures it may be assumed they had never been encouraged to make use of it; so when the carrier and postmaster kicked at the change, the patrons were ready to back them up probably for personal reasons alone.

As the patrons of the rural mails have never been encouraged, as a whole, to make use of the parcel post—the mail facility which makes it vastly to their advantage to be linked up as closely as possible with consuming markets—they usually defer all questions of their own interests in the premises to the wishes of the carriers and the postmasters.

Therefore, the average Congressman finds it to be highly to his own political interests to keep in good favor with the carriers and the postmasters who, in turn, will promote good will for him among the patrons of the rural mails.

Thus a vicious cycle, fanned by "pork" and patronage and sustained by manipulation, is set up and kept going. In a majority of congressional districts, the expenditure on rural mails is in great part largess. The annual appropriation for R. F. D. mails is now $86,800,000. It has increased to the extent of about $45,000,000 in eight years. And the increase has been virtually for salaries alone; for in the last eight years only $500,000 has been given for additions to the service.

Figures collected last July show that all the postage collected from mail matter going to or arising from rural routes totals only $51,502,331. The R. F. D.'s, it is estimated, perform only one-fourth of the service attached to the handling of that mail; which means that the patrons of the rural mails pay approximately $12,500,000 of the $86,800,000 spent on delivering mail to their door. The rest is borne by other patrons of the mails and the taxpayers generally. Hence the average Congressman with a district serried by R. F. D. routes is interested largely in getting his district's full part of the appropriation which, by strict analysis, is 75 per cent subsidy. The distribution of funds, rather than the character of the service they might make possible, most engages the thought of the lawmaker.

And to that vicious condition may in large part be attributed the failure of the parcel post as a convenience and a saving to the millions of producers remote from buying or selling markets. Where in practice it is of one item of help to the farmer, the parcel post is of a thousand items of help to big business which didn't need it. In fact, the figures would indicate that town and city people are the ones who chiefly use the parcel post in dealing with the big mail order houses.

What might be done with a soundly organized and directed R. F. D. mails service, is shown by what has been accomplished during recent years through experiments in branches of the postal service not so severely restricted by congressional legislation.

Several truck routes operated between producing sections and large cities, on a strictly business basis, with big automobile vehicles owned by the government and run by salaried postal employes, proved highly successful.

Star routes that have been put under direct government operation and likewise conducted have also been successful. One of that kind operated between Price and Vernal, Utah, increased the volume of business from 199,000 to more than 700,000 pounds a month in less than a year. They point out to you on that star route a bank building that, in the form of bundles of brick and other materials, was shipped hundreds of miles across the desert by parcel post.

But all efforts to build up parcel post business between the patrons of the ordinarily conducted rural routes and the consuming towns and cities have been virtual failures. The volume of that business today, despite the complaints about the heavy tolls taken by middlemen, is scarcely larger than it was three or four years ago.

It means that the government established a great facility for distribution and then said, in effect, that any consequential use of it shall be penalized. Hence it is employed only to the extent of about five per cent of the possible and not more than 10 per cent of the easily practicable—that is the R. F. D. mails as they exist today probably could be used in ten times the prevailing volume without entailing a cent of extra expense to the government.

(C) U. & U.

Above—This postal truck for a time connected Maryland farms, far from railroads, with the consuming public of Washington, D. C. The mail development thus begun has been practically abandoned, but not because the experiment was a failure.

Below—This mail truck shows how the postal service can utilize the motor car in facilitating distribution of foodstuffs—but comparatively few are so used.

Jewish Control of the American Theater

In 35 Years the Whole Tenor of the American Stage Has Changed. Talent Discarded for "Effects," "Extravaganza" and Lewdness

THE Theater has long been a part of the Jewish program for the guidance of public taste and the influencing of the public mind. Not only is the Theater given a special place in the program of the Protocols, but it is the instant ally night by night and week by week of any idea which the "power behind the scenes" wishes to put forth. It is not by accident that in Russia, where they now have scarcely anything else, they still have the Theater, specially revived, stimulated and supported by Jewish-Bolshevists because they believe in the Theater just as they believe in the Press; it is one of the two great means of molding popular opinion.

Everybody has assumed offhand that the Theater is Jew-controlled. Few, if put to the test, could prove it, but all believe it. The reason they believe it is not so much what they see as what they feel; the American *feel* has gone out of the Theater; a dark, Oriental atmosphere has come instead.

Not only the "legitimate" stage, so-called, but the motion picture industry—the fifth greatest of all the great industries—is also Jew-controlled, not in spots only, not 50 per cent merely, but entirely; with the natural consequence that now the world is in arms against the trivializing and demoralizing influences of that form of entertainment as at present managed. As soon as the Jew gained control of American liquor, we had a liquor problem with drastic consequences. As soon as the Jew gained control of the "movies," we had a movie problem, the consequences of which are not yet visible. It is the genius of that race to create problems of a moral character in whatever business they achieve a majority.

Every night hundreds of thousands of people give from two to three hours to the Theater, every day literal millions of people give up from 30 minutes to two hours to the Movies; and this simply means that millions of Americans every day place themselves voluntarily within range of Jewish ideas of life, love and labor, within range of Jewish propaganda sometimes cleverly, sometimes clumsily concealed. This gives the Jewish masseur of the public mind all the opportunity he desires; and his only protest now is that exposure may make his game a trifle difficult.

Slapping the Gentile's Beliefs

THE Theater is Jewish not only on its managerial side, but also on its literary and professional side. More and more plays are appearing whose author, producer, star and cast are entirely Jewish. They are not great plays, they do not remain long. This is natural enough, since the Jewish theatrical interests are not seeking artistic triumphs, they are not seeking the glory of the American stage, nor are they striving to develop great actors to take the place of the old line of worthies. Not at all. Their interest is financial and racial—getting the Gentiles' money and Judaizing the Theater. There is a tremendous Judaizing movement on; the work is almost complete. Boastful articles are already beginning to appear in the Jewish press, which is always a sign.

Gentile attendants on the Theater are frequently insulted to their faces, and never know it. Recently one of the best known Jewish entertainers on the stage indulged in vulgar and sacrilegious references to Jesus Christ, whereat the Semitic portions of his audiences went into loud laughter, while the Gentiles sat blank-faced—because the remarks were in Yiddish asides!

Time after time the Jewish entertainer did that thing, and it was very plain to one who knew that the Jewish portion of the audience was enjoying the insult to the Gentiles much more than they were enjoying the well-worn humor of the entertainer's remarks. It was a great thing for them that in several important American cities they could see and hear being done under cover, and to American Gentiles, what is being done openly to Russian Gentiles.

In the audiences referred to there was probably $4,500 to $5,000 in gate money represented. Of this the Jews present, at the very highest estimate, could not have contributed more than $500. Yet the Jewish star several times slapped the religious sensibilities of the major portion of his audience under cover of Yiddish. The Theater is felt by him and his ilk to be a Jewish institution.

Down to 1885 the American Theater was still in the hands of the Gentiles. From 1885 dates the first invasion of Jewish influence. It meant the parting of the ways, and the future historian of the American Stage will describe that year with the word "Ichabod." That year marks not only the beginning of the Jewish wedge of control, but something far more important.

It is not important that managers are now Jews whereas managers were formerly Gentiles. That is not important. The importance begins with the fact that with the change of managers there came also a decline in the art and morals of the stage, and that this decline has become accelerated as the Jewish control became widened. What Jewish control means is this: that everything has been deliberately and systematically squeezed out of the American Theater except its most undesirable elements, and these undesirable elements have been exalted to the highest place of all.

"High-brow Stuff" A Jewish Slur

THE Great Age of the American Theater is past. About the time that Jewish control appeared, Sheridan, Sothern, McCullough, Madame Janauschek, Mary Anderson, Frank Mayo, John T. Raymond, began to pass off the stage. It was natural that, life being brief, they should pass at last, but the appalling fact began to be apparent that they had left no successors! Why? Because a Hebrew hand was on the stage, and the natural genius of the stage was no longer welcomed. A new form of worship was to be established.

"Shakespeare spells ruin," was the utterance of a Jewish manager. "High-brow stuff" is also a Jewish expression. These two sayings, one appealing to the managerial end, the other to the public end of the Theater, have formed the epitaph of the classic era. All that remained after the Hebrew hand fell across the Stage were a few artists who had received their training under the Gentile school—Julia Marlowe, Tyrone Power, R. D. McLean, and, a little later, Richard Mansfield, Robert Mantell, E. H. Sothern. Two of this group remain, and with Maude Adams they constitute the last flashings of an era that has gone—an era that apparently leaves no great exemplars to perpetuate it.

The present-day average of intelligence appealed to in the American Theater does not rise above 13 to 18 years. "The tired business man" stuff (another Jewish expression) has treated the theatergoing public as if it were composed of morons. The appeal is frankly to a juvenile type of mind which can be easily molded to the ideals of the Hebraic theatrical monopoly. Clean, wholesome plays—the few that remain—are supported mainly by the rapidly vanishing race of theatergoers who survive from an earlier day; the present generation has been educated by the narrowed compass of modern dramatic themes to support plays of an entirely different type. Tragedy is taboo; the play of character, with a deeper significance than would delight the mind of a child, is out of favor; the comic opera has degenerated into a flash of color and movement—a combination of salacious farce and jazz music, usually supplied by a Jewish song-writer (the great purveyors of jazz!) and the rage is for extravaganza and burlesque.

The bedroom farce has been exalted into the first place. With the exception of "Ben Hur," which is favored by Jewish producers apparently because it holds before the public a romantic picture of a Jew (a very un-Jewish Jew, by the way), the historical drama has given way to fleshly spectacles set off with overpowering scenic effects, the principal component of which is an army of girls (mostly Gentiles!) whose investment of drapery does not exceed five ounces in weight.

The Protest of "The Little Theater"

FRIVOLITY, sensuality, indecency, appalling illiteracy and endless platitude are the marks of the American stage as it approaches its degeneracy under Jewish control.

That, of course, is the real meaning of all the "Little Theater" movements which have begun in so many cities and towns in the United States. The art of the drama, having been driven out of the Theater by the Jews, is finding a home in thousands of study circles throughout the United States. The people cannot see the real plays; therefore they read them. The plays that are acted could not be read at all, for the most part, any more than the words of the jazz songs can be read; they don't mean anything. The people who want to see the real plays and cannot, because Jewish producers won't produce them, are forming little dramatic clubs of their own, in barns and churches, in schools and neighborhood halls. The drama fled from its exploiters and has found a home with its friends.

The changes which the Jews have made in the Theater, and which any half-observant theatergoer can verify with his own eyes, are four in number.

First, they have elaborated the mechanical side, making human talent and genius less necessary. They have made the stage "realistic" instead of interpretative. The great actors needed very little machinery; the men and women on the pay rolls of the Jewish managers are helpless without the machinery. The outstanding fact about the vast majority of present-day performances of any pretension is that the mechanical part dwarfs and obscures the acting, however good. And this is the reason: knowing that good actors are growing scarce, knowing that the Jewish policy is death to talent, knowing perhaps most keenly of all that good actors constitute a running charge on his revenue, the Jewish producer prefers to put his faith and his money in wood, canvas, paint, cloth and tinsel of which scenery and costumes are made. Wood and paint never show contempt for his sordid ideals and his betrayal of his trust.

And thus we have, when we go to the theater today, bursts of color, ruffles of lace and linen, waving lines and dazzling effects of light and motion—but no ideas, a great many stage employes, but very few actors. There are drills and dances without end, but no drama.

That is one influence on the American Theater which the Jew claims, and the credit for which can be given him in full. He has put in the iridescence, but he has taken out the profounder ideas. He has placed the American public in the position of being able to remember the names of plays without being able to recall what composed them. Like the "Floradora Girls," a Jewish creation, we remember the name of the group, but not of any individual in it. The Jew has done this to perfection, but no one will contend that it represents a forward step; taken by and large, it is part of a very serious and harmful retrogression.

Second, the Jews may be credited also with having introduced Oriental sensuality to the American stage. Not even the most ardent Jewish defender will deny this, for the thing is there, before the eyes of all who will see. Little by little the mark of the filthy tide has risen against the walls of the American Theater until now it is all but engulfed. It is a truism that there is more unrefined indecency in the higher class theaters today than was ever permitted by the police in the burlesque houses. The lower classes must be restrained in the vicarious exercise of their lower natures, apparently, but the wealthier classes may go the limit. The price of the ticket and the "class" of the playhouse seems to make all the difference in the world between prohibited and permissible evil.

The "Cabaret" Policy Is Jewish

IN NEW YORK, where Jewish managers are thicker than they ever will be in Jerusalem, the limit of theatrical adventuresomeness into the realm of the forbidden is being pushed further and further. Last season's spectacle of "Aphrodite" seemed to be deliberately designed as a frontal attack on the last entrenched scruple of moral conservatism. The scenes are most Oriental in their voluptuous abandonment. Men in breech-clouts, leopard skins and buckskins, women in flimsy gowns of gossamer texture, slashed to the hips, with very little besides, made a bewildering pageant whose capstone was the unveiling of a perfectly nude girl whose body had been painted to resemble marble. Save that it was all designed, and all put through on schedule, it was almost the "limit" to which such exhibitions could go in real life. Its promoter, of course, was a Jew. As an entertainment it was infantile; the splendor of its insinuations, the daring of its situations, were the fruitage of long study of the art of seducing the popular mind.

It was said when "Aphrodite" first appeared that the police had moved against it, but some held that this was a clever press-agent stunt to excite public interest in the promised pruriency. It was also said that even had the police interference been the genuine result of outraged official minds, the fact that the Jews of New York are represented in the judiciary out of all proportion to their numbers, would have rendered the Jewish producer free from interference. In any event, the piece was not molested. The sale of narcotics is illegal, but the instilling of insidious moral poison is not.

The whole loose atmosphere of "cabaret" and "midnight frolic" entertainment is of Jewish origin and importation. Mention the best known and the worst known, they are all Jewish. The runway down which less than half-dressed girls cavort, fluttering their loose finery in the faces of the spectators, is an importation from Vienna, but a Jewish creation. The abuses of the runway will not bear description here. The Paris boulevards and Montmartre have nothing at all in the

nature of lascivious entertainment that New York cannot duplicate. *BUT* neither New York nor any other American city has that *Comedie Française* which strives to counterbalance the evil of Paris.

Where have the writers for the Stage a single chance in this welter of sensuousness? Where have the actors of tragic or comic talent a chance in such productions? It is the age of the chorus girl, a creature whose mental caliber has nothing to do with the matter, and whose stage life cannot in the very nature of things be a career.

The Making of a Stage "Star"

IT IS only occasionally that a great writer for the stage, a Shaw, a Masefield, a Barrie, an Ibsen, or any Gentile writer of merit, is permitted to get as far as actual production, and then only for a short period; the stream of colored electric lighting effects, of women and tinsel closes in behind them and they are washed away, to survive in printed books among those who still know what the Theater ought to be.

A third consequence of Jewish domination of the American stage has been the appearance of "the New York star" system, with its advertising appliances. The last few years of the Theater have been marked by numerous "stars" that really never rose and certainly never shone, but which were hoisted high on the advertising walls of the Jewish theatrical syndicates in order to give the public the impression that these feeble lantern-lights were in the highest heaven of dramatic achievement.

The trick is a department store trick. It is sheer advertising strategy. The "stars" of yesterday, who did not even survive yesterday, were either the personal favorites of managers, or goods taken off the shelf and heaped into the window for the sake of giving the appearance of a new stock. In brief, whereas in normal times the public made the "star" by their acclaim, nowadays the Jewish managers determine by their advertisements who the star shall be. The "New York stamp," which frequently means nothing at all, is the one imperial sign of favor, according to the Jewish theatrical hierarchy. It is just this "New York stamp" that the rest of the country protests against; and the "little theater" movement throughout the West and Central West is a significant protest.

A Mary Anderson or a Julia Marlowe would be impossible under the Jewish system. They were disciples of art, who later became artists, and then were rightfully acclaimed as stars. But their development was a tedious process. Their fame was based on the rising approval of the people, year after year. These actresses put in season after season traveling the same circuit, learning little by little, rounding out their work. They did not have nor did they seek the "New York stamp"; they worked first for the approval of the people of "the provinces," which is the contemptuous Jewish term for the rest of the United States. There was, however, no Jewish dictatorship of the Theater when Mary Anderson and Julia Marlowe were building their art and careers; which throws a light on the reason for there being no Mary Andersons or Julia Marlowes coming up to the succession.

The Jew seeks immediate success in all but racial affairs. In this breakdown of the Gentile Theater, the process cannot be too swift for him. The training of artists takes time. It is far simpler to have the advertising bills serve as a substitute and, as the itinerant faker-dentist had a brass band blare loud enough to drown the anguished cries of his victims, so the Jewish manager seeks to divert attention from the dramatic poverty of the Theater by throwing confetti, limbs, lingerie and spangles dazzlingly into the eyes of his audience.

These three results of Jewish control in the Theater are all explainable by a fourth; the secret of the serious change which has occurred since 1885 is found in the Jewish tendency to commercialize everything it touches. The focus of attention has been shifted from the Stage to the box office. The banal policy of "give the public what they want" is the policy of the panderer, and it entered the American Theater with the first Jewish invasion.

About 1885 two alert Jews established in New York a so-called booking agency and offered to take over the somewhat cumbersome system by which managers of theaters in St. Louis, Detroit or Omaha arranged engagements of attractions for their houses for the ensuing season. The old process involved extensive correspondence with producing managers in the East and many local managers were obliged to spend several months in New York to make up a season's bookings. The advantages were that the booking agency, supplied with a list of the "open dates" of the houses they represented, were able to lay out a complete season's itinerary, or "route," for a traveling company and enabled the producer of a play to spend his vacation at the seashore instead of passing the sultry midseason in New York, while the local manager was saved the trouble of much writing or even a trip East, and was content to let the booking concern attend to all details and send him his next season's bookings when completed.

The Origin of the Booking Trust

IN THIS manner was laid the foundation of the later-day Theatrical Trust. The booking firm was that of Klaw & Erlanger, the former a young Jew from Kentucky who had studied law, but drifted into theatrical life as an agent; the latter a young Jew from Cleveland with little education but with experience as an advance agent.

The booking system was not of their devising. They borrowed the idea from Harry C. Taylor, who had established a sort of theatrical exchange where producers and local managers could meet, desks being provided them at a small rental, and who took over the booking in the smaller cities, without foreseeing—but probably scorning—the opportunity thus placed in his hands to club the whole theatrical world into submission to his dictates.

With characteristic shrewdness Klaw & Erlanger elaborated the idea they had borrowed from Taylor, opened competition against the latter and enlisted the support of a number of young Jewish advance agents who were beginning to recognize the lucrative opportunities which the theatrical profession afforded. Prominent among their earliest supporters was Charles Frohman, employed by J. H. Haverley. His brother, Daniel, had been business manager for the Mallorys at the Madison Square Theater since 1881, and though the Frohmans stand out in relief from the background of the *Polish Jewish* influence on the theater, they found it to their advantage to co-operate with the booking firm and subsequently became prominent members of the Trust.

The Drama Becomes Merchandise

THE establishment of the Jewish booking agency system is the key to the whole problem of the decline of the American stage. The old booking system had the enormous advantage of the personal touch in the relationship between manager and company, and made possible the development of genius in accordance with the organic laws which determine its nurture, growth and fruition. Except in its highest form, acting is not an art; but heaven-born genius is no more vocal in an Edwin Booth without long training than a Bonaparte is necessarily a world conqueror without the technique of the artillery school. These two thoughts have the utmost bearing on giving the Jews the control of the theater.

There being no "syndicate," no pooling, among the Gentile managers of the 80's, they presented their stars or other attractions at rival theaters in competition as individual offerings, and at the end of a reasonable New York run, not forced for "road consumption," took their companies on a tour of the country. The manager's whole investment was probably tied up in his enterprise. He thus became a part of his group of artists, sharing their hardships of travel, their joys and sorrows. If business was good they shared the satisfaction; if otherwise, it was sink or swim for one as well as the other. In those days much was heard about troupes traveling "on their trunks." The stories were not exaggerated, but life had its better side, too. The manager and the actor were daily companions; there was a mutual absorption of ideas; the manager learned to know and appraise the "artistic temperament"—which is a tangible asset when not a form of artificial grouch or congenital ill-nature—and to respect the actor's point of view, while, reciprocally, the actor was able to place himself in the manager's position and to get his point of view from close personal affiliation.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Correspondence from Russia says that a split is appearing between the Jewish Bolshevists and their dupes, with a most curious cause. The Russians claim that the Jewish Soviet Government is secretly encouraging anti-Jewish pogroms, for which the Russian groups know that afterward they will be blamed. This alleged encouragement by official Jews of a movement against the Jews, is not by any means new in history. The Jewish leaders have always known how to make the best of "anti-Semitism." That is the reason why they work so desperately in the United States to make their people believe that any mention whatever of the Jewish Problem is "anti-Semitism." But the only reasonable explanation that now occurs to account for the alleged anti-Semitism of the Jewish Bolshevists is this: Soviet Russia is probably near its downfall. A graceful way out—from the Jewish-Bolshevist point of view—would be a wholesale rising of the Russian people against the Jews. This would bring European intervention, and—note the irony of it—a Europe that would not do anything for the Russian people will rush to help the Jews. Thus, with Russia's wealth sucked dry, the Bolshevik leaders will slip safely away, as they always do, and the whole thing will go up in smoke, attributable to "anti-Semitism."

Esther Rachel Kaminsky, a well-known Jewish actress, recently returned to Warsaw after two years' sojourn in Russia and Ukrainia. She told the reporters that in Soviet Russia artists were treated as "privileged proletarians" and that the Bolshevik officials offered her good terms if she would play for them. Miss Kaminsky preferred, however, to act on her own hook. She met with great success and was well treated everywhere.

There are some 18,000 Jews living within the borders of the newly created kingdom of the Serbs, Croats and Slovenes, commonly referred to as Jugo-Slavia. This is about ten times the Jewish population of pre-war Serbia. Colonel Abraham Baruch, who served with distinction in the Serbian Army, is now military governor of Sarajevo, where the bullet of an assassin exploded the passions that resulted in the World War. When on a recent ceremonial occasion the heads of the various churches in Sarajevo including the Jewish rabbi, called upon him with greetings, Colonel Baruch responded: "I am going to answer you briefly; 'Leshono Ha-booh b'Jerushalem'."

"Commissioner of Internal Revenue Williams has just issued instructions that hereafter rabbis desiring wine must first satisfy the state prohibition director that "the quantity applied for is not excessive." In other words, the expected has happened. The Eighteenth Amendment allows wine to be used for sacramental purposes, and the efforts of the government to interpret this religious permission in a liberal manner has been turned into license. In San Francisco, the abuse of the wine privilege was so shocking that prominent Jews recently interfered to stop a traffic which damaged the fair name of Judaism in that city. A rabbi, last summer, was offered $500 a month by a firm, provided he would move to San Francisco and sign his applications in favor of that liquor concern. Reform Jews are quite willing to use grape juice instead of wine. If orthodox Jews still insist on the tradition of wine, let them also insist that the permission to use wine, which our government allows, be not turned into a money-making scheme for a few Jews, to the shame of the great majority."—Dr. Rudolph I. Coffee, in Chicago *Sentinel*.

"Though we Jews do not meddle in international politics (!)," says the editor of a Chicago Jewish paper, "we certainly rejoice at the breaking down of the White Terror in Russia. All its leaders, Korniloff, Kalidine, Koltchak, Denikin, Yudenitch and Wrangel, have picked out the Jews as their scapegoat . . . . The pogroms in the Ukraine will completely stop when the few bandits like Balkowitsch and Machno still roaming around the country will be rounded up by the Soviet forces and annihilated." This certainly is clear as to which side in Russia commands the sympathy and support of American Jewry.

The Chicago *Forward*, of December 21, has an article on the industrial situation, in which occur the following passages:

"The workman cannot wait until the abolition of the capitalistic system is an accomplished fact. The number of laborers who are out of work grows with every day, so something has to be done by the workmen's class.

"The associated *Jewish trade workers*, of Chicago, are therefore doing a good thing in behalf of the workmen by calling *on the 26th of December a meeting* of all trade unions, branches of workmen's clubs and socialistic organizations. Many single workmen and also whole organizations go around with plans to better the present condition by production organizations and the like. Only a conference of the whole labor movement can bring light in deciding what can be done in the present situation. It is therefore essential that all labor organizations shall be interested in the question of lack of work, that they help discuss it in that meeting, and that they send delegates to that important conference, which is called by the United Jewish trade organizations, of Chicago."

The restrictions on immigration into Palestine imposed by the government of Sir Herbert Samuel have aroused much protest among Jews in England and on the Continent. Such radical factions as the Poalei Zion, the Zerei Zion and all those who look to Israel Zangwill as their leader are especially fierce in their denunciation of the measure. They point out that these restrictions are arbitrary and despotic in nature and more severe than the immigration restrictions of the United States or Canada. These factions further charge that the Zionist Organization has misled the Jewish people by making it believe for a long time that the British Government had handed over to it the entire control of immigration and emigration, while it now transpires that the British Government retains full and exclusive control of all such matters. It is said that if Palestine is really to be the "Jewish homeland" in Mr. Balfour's historic phrase, then no Jew should be excluded or expelled from the country, no matter what his sins of omission or commission may be. The whole controversy discloses ticklish possibilities in Sir Herbert Samuel's position as a zealous Zionist on the one hand and as a loyal British pro-consul on the other.

Metal That Defies the Melting Pot

What the Government Officially Thinks of Some of the Immigrants:

THE non-British aliens who obtain vises consist chiefly of Poles and Polish Jews, who have large families, and generally are engaged in the garment trade. They are an undesirable class of immigrant, as they live almost entirely in large cities, particularly New York.

It is estimated that persons waiting for vises at the present time will be in excess of 400 per diem. At least 350,000 Polish Jews and Poles are preparing to proceed to the United States during the current year. Some estimates place the total at 500,000 and 1,000,000 as the number of persons who may emigrate. This is due to filtration of persons from the newly acquired territory of Poland.

Restriction of emigration from Poland is highly desirable because of the unassimilable character of the large majority of the emigrants and because of the immediate danger of their carrying contagious diseases now prevailing in that country.

Excerpts from an official Department of State report, dated December 11, 1920, submitted at the request of Representative Albert Johnson, chairman, Committee on Immigration, House of Representatives.

THE discomforts the immigrants were suffering at overcrowded Ellis Island rather than the perils they brought the nation were the inspirations of the attention first directed toward the incoming hordes last summer. But attention once directed toward the Ellis Island situation could not fail to focus on the undesirability of the quality of the immigrants.

The New York port's accommodations were taxed to the limit in handling immigration as early as last June. Since then, instead of decreasing, the immigration tide has increased. In July, 83,959 persons were admitted to the country. In August, immigrants totaled 86,500. In September the total was approximately 98,400. In October the 100,000 mark was passed.

How extensive is the immigration likely to become? is the natural inquiry.

The answer was best stated in the report of the House Immigration Committee filed with the proposed bill for drastically limiting the tide of incomers. So alarming did the great majority of the committee view the present situation that they reported the proposed bill favorably on the opening day of the short session of Congress and asked the House to limit debate to four hours and pass it immediately.

If there were in existence a ship that could hold 3,000,000 human beings, the 3,000,000 Jews of Poland would board it to escape to America.

The committee's report on the Jewish situation shows their comprehension that the immigration problem is one of races rather than numbers. The class legislation inhibition in American law, however, prevents exclusion of the undesirables from the racial standpoint, so the committee was obliged to go to the length of urging almost total exclusion of all immigrants. But of the matter of remedies for immigration evils, discussion will be had later.

In the House Committee's report, attention is paid to the volume and class of immigrants coming into the country. It is pointed out that all countries contribute to the flood, but that Jews form a majority of the newcomers.

These conclusions agree with the information offered by Ellis Island officials and variously presented by observers during recent months.

Statistics of the Immigration Department at Washington for the fiscal year ending June 30, 1920, show that the net increase in foreign-born population was approximately 200,000, of which about 16,000 were listed as Hebrews. This discrepancy from statements regarding the Jewish rush of immigrants is due to two facts, first that many Jews were listed under the names of other nationalities and second, that the big rush from Danzig and other Jewish centers began this summer, at the close of the fiscal year.

The Ellis Island immigrants include a few from the United Kingdom and the Scandinavian countries, even fewer from France and Holland, and practically none from Russia. Spaniards and Portuguese are fairly numerous, but until comparatively recently emigration to the countries of Southeastern Europe more than counterbalanced immigration from those lands.

Outside of relatively insignificant numbers of immigrants from small nations, this cataloging leaves to consider:

Jewish immigration
Central European immigration
Italian immigration.

In theory, immigration is forbidden from Germany and Austria, as it is impossible from isolated Russia. In fact, however, vast numbers of immigrants are coming into the country who until they left for this land had never been on soil other than that which belonged to the German and Austro-Hungarian empires prior to the armistice.

There is perhaps a little grim humor in this fact that we exclude immigrants from countries with which we are still theoretically at war, while we welcome freely un-warlike immigrants from the same lands.

Persons who visit Ellis Island comment with surprise on the fact that German is the language they hear most frequently. The explanation is simple. The partitioning by the Peace Conference of the Central Empires placed many sections under new governments. Poland, Czecho-Slovakia, Jugo-Slavia and several other new nations sprang up. From these lands come Jews who speak only German or Hungarian. While our government has not ratified and recognized the Versailles Treaty as making a peace with the Central Empires, still we treat as nations the governments that treaty set up and are therefore able to admit immigrants from them.

Poland is the country which furnishes the largest proportion of immigrants. They are with few exceptions Jews. Some, it is true, have always lived in parts of the German Empire which still remain under control of the German Republic, but with ready consciences they have been able to tell the American consuls at the port of embarkation that they are Poles, Czechs, Slovenes, or what not.

Thus it is that the country is filling up with thousands of German-speaking Jews, while millions of Teutons of the same stock that forms a large part of the Anglo - Saxon - Celtic - Teuton backbone of the country, are excluded.

Frederick A. Wallis, immigration commissioner, recently announced that several millions of Germans were eager to come into this country as soon as peace was concluded. Their scruples which forbid them to claim a nationality other than their own seem to bar their entrance, however, while their Jewish next-door neighbors continue to come in droves.

Poland is the place from which the great proportion of immigration is coming. Warsaw is the center of the movement. Danzig is the port of embarkation.

A few years before the war, Poles furnished a large percentage of the immigration. Immigration of persons of Polish extraction is light now, although government statistics hereafter will probably indicate the contrary. Many of the Jews call themselves Poles. the continuance by the Polish Government of a large standing army is a cause of the comparative smallness of Polish immigration.

Jews are taking advantage of the state of war with Germany and Austria, the Russian isolation, and the large standing armies in Poland and other countries, to occupy every bit of available space on the ocean liners bound for America.

"There are 250,000 Jews in Warsaw, determined to get into the United States," said Ole Hansen, former mayor of Seattle who returned a few weeks ago from an investigation in Europe. The House Committee's estimate of three millions followed early in December.

Italian immigration, next to the Jewish, is the largest with which the authorities have to deal. It is not the same quality as that of the Jews but it, too, presents a problem.

Officials at Ellis Island say that the Jews entering the country are with rare exceptions of a very low type. Dispatches which have seeped into the country from Warsaw indicate that the Poles believe the emigration to America is gradually ridding their country of the worst type of Jew, however bad some of those remaining may be.

"TYPES"

The Italian immigration, as distinguished from the Jewish, is viewed by the immigration officers as largely productive. The incoming Jew who will add productive impulse to the country is the rarity; the incoming Italian who will not is the rarity. That refers to the present status. It is reported that 3,000,000 Italians are awaiting opportunities to come to this country. It may well be that in that great number there will be many undesirables.

At present, however, the Italians returning consist of Italian reservists, whose character may be judged by the fact that they returned voluntarily to their country on the outbreak of the war. In addition there are the wives and children of Italians now in the country. These latter are, of course, for the time being burdens on the productivity of the country. But it is assumed that the children growing up under American institutions may be expected to become good citizens.

But there is a problem presented by the Italian immigrant—perhaps it would be better to say the Sicilian, Neapolitan, or Calabrian immigrant. From these districts there have come the banditti who have terrorized the foreign sections of New Orleans, Chicago, New York, St. Louis, Detroit and other cities in years back. They furnish the "sawed-off shotgun" gangs.

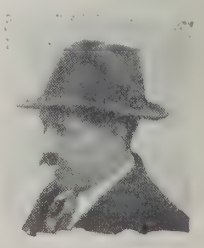
Periodical outbreaks of these warring elements, call them the Mafia, the black hand, or what you will, have resulted from trade jealousies and blackmail operations. Police in the cities in which epidemics of killings have occurred have without notable exception been powerless to check the feudist murders.

The exclusion of these professional outlaws who live by a code of their own and in defiance of American law is a matter of selection and investigation. Immigration laws give the authorities power to exclude known criminals, but the necessity of proof makes the law practically worthless.

The Jew immigration problem, therefore, is viewed by the Ellis Island authorities as a racial exclusion problem; the Italian exclusion problem is considered a matter of individual investigation and selection. Immigration officers have long cherished the suspicion that European police forces have encouraged and aided their criminal classes to come to the United States.

American law provides no means of investigation of the character of immigrants except such as can be made by inquiry at the port of entry. American consuls, rushed with demands for passports, can only see that the formal printed questions on the application blanks are asked; they have no way of checking up each applicant's record in the community from which he comes. The viséing of passports is therefore little more than a formality. Some countries have regular investigation agencies working in countries from which immigration comes, and each applicant's record is closely scrutinized before he is allowed to sail.

One other matter should be considered before the question of the remedy for the immigration evil is considered. This is the ability of the agencies the United States possesses to cope with the great tide of newcomers.



Newspaper articles for several months have pointed out the inadequacy of Ellis Island facilities to care for the great numbers of steerage passengers who enter the country.

There is no question of the truth of these articles. Solutions to the problem have been largely confined to suggestions of the establishment of more immigration stations and the enlarging of the inspecting force.

At Ellis Island, however, from the overworked officials who are on the job from early morning until late at night there is another suggestion voiced with unanimity. It is:

"Cut down the immigration."

The Ellis Island inspectors are experienced, and in most cases able men who have retained their jobs at rather low scales of pay because of real interest in the work they are carrying on. Their ability to perform the work has been unquestioned.

They are a rather despondent lot just at present, partially because of overwork, but more largely because of the futility of much of their work.

Applicants for admission to the United States pass rigid medical and physical tests and are then examined as to their mentality under the literacy law. Immigration inspectors working sincerely have been lenient in their requirements. But they have felt that their duty called for the exclusion of undesirables. They have so recommended.

But in seven out of ten cases, the persons whom the immigration board asked be kept out of the country as menaces appeals to the Secretary of Labor have overruled the board. Last year only 2,777 immigrants were rejected finally and only 111 of these failed because of the literacy test.

Appeals to sympathy, political pleas and other reasons of similar nature, have contributed to the action of the appeal official in admitting the all too few thousands the local Ellis Island board ruled were unfit to associate with American citizens.

The matter of proposed remedies and the possibility of effectuating them will be taken up in the third and last article of this series.

Yaqui, Last Indians to Yield, Turn to Peace

After 400 Years of Warfare, Lay Down Knives to Pick Up Hoes

By H. H. DUNN

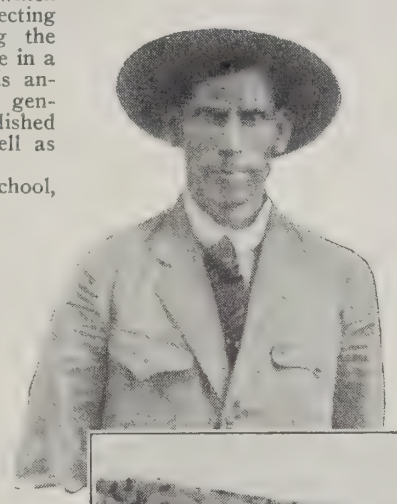
THE last tribe of Indians of North America, and the last but two in the New World, has yielded to the march of civilization, and, after nearly 400 years of constant warfare against the whites, laid down its knives to pick up shovels and hoes, and turned in its rifles in exchange for tractors and harrows. The tribe, which still numbers somewhat more than 3,000 individuals, is the Yaqui, who have held their mountain valleys and villages in the state of Sonora, in the northwest corner of Mexico, against all comers ever since they arrived there, supposedly in the Athapascan migration, possibly later, but certainly before the coming of the Spanish *Conquistadores,* in 1520, for these Iberian adventurers found the Yaqui a powerful tribe, whom neither they nor their Mexican successors in the Land of *Mañana* have been able to subdue.

Yet, this fall, the Yaqui "elder men," led by Chief Mori, went voluntarily to Hermosillo, the capital of the Mexican state of Sonora, and there bound themselves by treaty, not only to forego their raids on the Mexican villages of the coast and to permit exploration of their country by geologists and mineralogists, but also to send their young men and women with such of the older ones as may wish to go, to the reservation set apart for them at Potam, Sonora, on which the Mexican Government is now erecting buildings for their use, and installing the latest agricultural machinery for their use in a farm demonstration school. Later, it is announced by the Sonoran Government, a general industrial school will be established there, teaching mechanical trades as well as farming.

In addition to this reservation and school, the Yaqui have been given permanent hereditary titles to all the domain they now occupy in the mountains of the headquarters of the Yaqui and Mayo and Fuerte rivers, with preference in the filing on any and all government lands they may wish to take up, especially in the cases of those who have no title or right to any of the tribal lands. The Yaqui agree to furnish 200 young men annually for training in the Mexican federal army, each year's quota to be released from its enlistment at the expiration of three years' service. The government pledges itself to send no armed expeditions to enforce any of its laws, but to leave the policing of the tribe—except those on the Potam reservation—to the council of elder men of the tribe. Where disputes arise between families of the tribe which this council finds itself unable to settle, a regularly established court from the state of Sonora will go to the Yaqui territory and, sitting there, render judgment, to which the Yaqui bind themselves to submit.

In return for the surrender of some 2,000 Mauser and other modern rifles, which the Yaqui have taken in their raids, the government furnishes hunting rifles and ammunition, not to exceed 1,000, estimated to be the number of men and boys who will hunt. The government also agrees to furnish every adult male Yaqui, head of a family, who will agree to cultivate faithfully a tract of land, a team of mules, wagon, seed and such farming implements as he may need, at cost, the Indian to pay for them in long-time yearly payments. Some 300 Indians already have asked for this equipment.

The story of this surrender—which carries the memory back to the days of the Five Nations, and follows down to Geronimo's last outbreak and arrest—was brought to the United States by the first Yaqui ever to come to this country on a mission of peace. He is Captain Cajeme Mori, son of the ruling chief of the Yaqui, who arrived in New Orleans, on his way to the agricultural demonstration stations in the sugar, cotton and rice districts of Louisiana, and the Mississippi Agricultural and Mechanical College, to study farming methods and the use of modern agricultural machinery.



Captain Mori, who has been for five years on the staff of General Plutarco Elias-Calles, former governor of the state of Sonora, and one of the leaders in the recent revolution which established a new government in Mexico, was largely instrumental in bringing his father and the Yaqui tribesmen to bend their knees to civilization, but he gives all the credit for the peace treaty to General Alvaro Obregon and to General Elias-Calles.

A tall, thin man, with the long face and black eyes of the Navajo, and the high cheek bones of the Brule Sioux is Captain Mori, and his Spanish crackles like the mesquite pods of his native Sonora when the fire sweeps the prairie, in decided contrast to the liquid, elided syllables of the Mexican.

"The cry of all Mexico," he said, "is, 'Let us have peace.' It is natural that the mass of the people, who have been at war among themselves for only ten years, should be weary of war, but sometimes it seems impossible for me to believe that my people, who have been fighting some invader or another for four centuries or more, should have made peace as they did, without a battle, solely on the word of one or two men in whom they had confidence.

"But they signed it, and now the many pages of Mexican history stained with deportations, small wars, raids, forays and massacres, appear to have been turned to the fertile fields swept clean for the plow by the scythe of the machete and the machine-gun. Ever since white men came to the New World, there has been trouble with the Yaqui, that branch of the great Ataplascan migration which halted—both actually in point of movement, and in point of progress in civilization—in the mountains of Western Mexico more than ten centuries ago. Discussion of the rights and wrongs of the quarrel is beside the question, now that peace has been made, but the first historical mention of the Yaqui is in the sixteenth century, when the first band of *Conquistradores* came into what is now Sonora. After continuous small wars, the first treaty was made when Don Francisco Ybarra brought my people, nominally, under the Spanish crown.

"One hundred and thirty years passed, a long period of broken agreements, and in 1740 another treaty of peace was signed, and a battalion of Yaqui soldiers, incorporated, just the same as now, in the governmental army, tried to bind the wild race to the royal rulers. This peace, however, did not last long, for the Yaqui demanded absolute control of their tribal lands in the Yaqui River Valley, and, failing to get this, again took to the warpath. In 1768 there was an outbreak which exceeded any preceding it, and the war lasted three years, when, both sides being exhausted and the forces of the crown far from their base, peace was concluded, which lasted until 1781.

Captain Cajeme Mori, son of Chief Mori, of the Yaqui Indians, who tells the story of the peace his tribe has signed.

"During this period of quiet, towns sprang up in the Yaqui River Valley, and plantations blossomed all over the lower part of Sonora. Gradually, the Yaqui saw their lands slipping away from them, and once more they began war, without warning. Within the next year, they destroyed more than a score of towns and villages, virtually all of which, except Altar and Alamos, are still in ruins, the white people having feared to rebuild them during all the 140 years which have succeeded since that time. Concepción and San Pedro, two of the towns destroyed, had about 5,000 inhabitants each, and were the largest towns at that time in Sonora.

The first meeting of the Yaqui peace delegates and the agents of the state government of Sonora on the lagoon near Empalme, just outside Guaymas. The Yaqui are on the extreme right.

"Up to 1832, warfare was intermittent, but constant, not a year going by without its foray by the Yaqui, or an expedition against them by federal forces of the many governments which alternately ruled in Mexico. The fight against the Spanish governors was transferred, whole-heartedly, and with the unanimous consent of the tribe, to their successors of the Mexican Government, when the nation won its independence from Spain, and continued until the powerful General Jose Urrea patched up another peace treaty, which held until the French invasion. Internal quarrels kept so many troops in the field that no further attempt was made to take lands from the Yaqui, and they remained quietly in the Yaqui River Valley, mere watchers of the conflict for state control on the plains and in the valleys below.

"In 1860, however, the Yaqui again went on the warpath, and stayed there until after Mexico had disposed of Maximilian and the Napoleonic dream of New World Empire, and a governor appointed by Benito Juarez had taken his seat in Arizpe, then capital of Sonora. General Ambrosio Pesquiera, who had almost as many 'ups-and-downs' as Francisco Villa, being one day dictator and the next day revolutionist, obtained a treaty with the Yaqui, but the coming of Francisco Serna to supersede Pesquiera ended that period of peace, and small combats continued until 1894, when the best-remembered of all the Yaqui outbreaks took place, to continue, to all practical intents and purposes, until May, 1920.

"Thousands in Sonora, and hundreds along the United States border of that state have cause to remember that 'Twenty-six Years' War,' as it is still known in Mexico. It was led, on the part of the Yaqui, by Cajeme Mori, shrewdest, but, at the same time, most implacable and most cruel of all the Yaqui against the whites. One factor which maintained the failure of the federal government to bring peace, was the alternation of Ramon Corral, afterward vice president of Mexico, and General Luis E. Torres, as governors of Sonora. Corral sought peace by granting the demands of the Yaqui; Torres held fast to a policy of extermination. Thousands of Yaqui men were deported to Yucatana, Quintana Roo and other distant parts of Mexico, under Torres' direction, while, when Corral ruled in Hermosillo, lands and money were given the Yaqui. No permanent result could have been expected from such an arrangement, and none developed.

"When, succeeding Torres, Mayotorena became governor, conditions went from bad to worse, for Mayotorena had neither the conciliatory attitude of Corral nor the iron hand of Torres, but vacillated, from day to day, between the two, while Mexico herself was so torn by the Madero, Orozco, Zapata, Villa, Carranza and other lesser revolutionary movements that the government forces, neither in numbers, morale nor spirit, were able to cope with the determined and vengeful Yaqui. Through this period, however, two men had been rising slowly to considerable strength in Western Mexico—Alvaro Obregon in Sinaloa, and Plutarco Elias-Calles in Sonora. The former made personal friends of the Yaqui chiefs, and when he became military governor of Sonora let them alone, merely repulsing their raids, sometimes swooping down on them just as they were preparing to start a raid, but never molesting them while they remained quiet, on their own lands. They began to respect Obregon, then to fear him, and, finally to admire him, as a man who, as you Americans say, always 'beat them to it.'

"General Elias-Calles succeeded General Obregon as governor of Sonora in 1917, but, largely because the Yaqui did not know him personally, he was unable to arrange a peace, though the forays became much less destructive, and further apart. Meanwhile, General Obregon, who was even then preparing for his own revolutionary movement, incorporated a regiment of Yaqui soldiers into his army, and invited me to represent the Yaqui on his staff. After three conferences with my father, Chief Mori, in which Obregon came alone and unattended to my father's headquarters on the upper Yaqui River, my father consented, and 600 Yaqui youths, with me, joined the state army of Sonora at Hermosillo. We soon learned that General Obregon was, even then, a vital influence in Mexican affairs, and to us it seemed that he was destined to take an even more important place. Naturally, we communicated this to the leaders of our people, with the result that a series of conferences were held, culminating in the recent visit of my father to Hermosillo, where the treaty of peace was signed.

General Plutarco Elias-Calles, former governor of Sonora, with whom the Yaqui signed their recent peace treaty.

"Under this treaty, the Yaqui retain all their lands. The schools of Sonora are opened to them free of all charge, even for such books as they may need. Another regiment of Yaqui young men has been taken into the federal army, and those who remained on the reservation have been allowed to retain their arms. An agricultural demonstration station is being established at Potam, about midway between Empalme, the Sud Pacific junction just outside Guaymas, and Navajoa, farther to the south. Here buildings are being erected for homes for the married men and living quarters for the single men, and all who wish will be taught how to farm the lands which have been set apart permanently for them. There is already a settlement of nearly 800 Yaqui at Potam, and the other Yaqui settlements, in which live now some 2,200 more of my people, are sending their younger element to learn at the Potam schools and farms. My father has firmly assured me that, so long as he is chief of the tribe, there will be no further trouble, and, as I am entitled to succeed him, I have assured the Mexican Government that I will continue his policy.

"Not only is this the best thing possible for my people, but it removes at once from the thousands of acres of fertile but uncultivated lands in Sonora and Northern Sinaloa the one menace which has kept them from being another California—the constant danger of raids by the Yaqui. Two large irrigation and farming projects in these two states, operated by Americans, which never have been able to attract American farmers to their lands because of these raids, but now I expect to see American farms, villages and towns, and, best of all, American agricultural methods, established throughout both states."

The Wood Hollow Papers

By ROBERT PAGE LINCOLN

This is the first of a number of wild life studies which will be made for The Dearborn Independent by Mr. Lincoln. We feel that "The Wood Hollow Papers" will prove a charming addition to the several unique features of this weekly.

IT IS strange, now that I think of it, I do not recall ever having seen the smaller members of the family of woodpeckers (in which we find the hairy and the downy woodpeckers) engaged in killing insects on the ground; indeed the few times I have seen any of these trunk working birds actually on the ground have been around the trees wherein I have established feed boxes—for these industrious little fellows are not above accepting some few choice sunflower seeds to round out and top off a meal composed of insect fare. Where some seeds have fallen to the ground I have seen them leave the tree trunks, descending to pick them up.

During the summer I have never witnessed a hairy or a downy woodpecker on the ground. But the same is hardly true of the golden-winged woodpecker, commonly known as the flicker. While it is well fitted by nature for tree work, like all members of the species, still ants constitute its principal fare. If you have ever witnessed a flicker delving and probing in an ant hole you have witnessed animation headed with a capital A. I recall with a smile the first time I had the honor of seeing this beautiful bird at this strange task of filling up on ants. My first glance showed me the flicker, but what he was engaged in doing was a mystery. He was energetically teetering up and down with his head. I saw his bill driven into the ground until I felt sure that the bill and everything back of it would soon be relentlessly imprisoned. Later, when he had flown I went to the place and by digging down I discovered that it was an ant hole the fellow had been enlarging, and it required but the putting of one and one together to ascertain the reason. Some time later I obtained a specimen of this variety of bird from a youthful scamp who had slain it with a sling shot made from the inner tube of a bicycle tire—and upon cutting open the stomach and studying the contents I discovered to my amazement that it was quite full of large ants. Observation in later years has given me reason to believe that this member of the woodpecker family is one of the deadliest enemies of the ants.

All of the winter birds are expressly fond of suet. I have fastened some parts of this delectable bird food (so easily acquired) to the tree outside the kitchen door and more in the oak by the shed. In the black oak by the door I have hung up three heads of sunflower seeds, and in the protected box by the shed I have placed the shelled seeds. The birds visit the boxes and the suet, coming from miles around, it would seem, and when they have had their fill proceed to the trees to fill up again on the insect mites and eggs which they consume in such vast quantities. Men who profess to have an illuminating inner knowledge of just how many insects a bird can do away with in one day, or in a given hour, assure me that the little black-capped chickadee consumes the mere matter of five thousand plant-lice eggs in one hour. This does not surprise me in the least. Sufficient in itself to say that from a careful watch of these vivacious little feathered bundles of joy I can truly add my confirmation to the above estimate. There is hardly one bird that puts in more time on the trees in the winter than the chickadee.

I can always tell when a stranger puts in his appearance at my feed box. There may have been silence before one or two seeds have been pecked open and the meats gobbled down, but immediately thereafter a jocund voice will break upon the wintry stillness that would cause most any one to turn. The feeling of surprise and unutterable delight upon finding such select morsels of food within so easy reach no doubt tickles the wee, small chickadee soul through and through. Then they will at once "give thanks" by pouring out a most ridiculous burble of music, turning around the limb in flighty exuberance; and even standing on their ears—if I may be permitted to say. I have now come to believe that the visitants at my bird box not only sing sweeter songs but I am sure there is not one tree on the place that has not been pickpocketed and fleeced of its insect life.

Invariably it is the blithsome song of *chick-a-dee-dee-dee* that you hear issuing from this little fellow with probably a *dee-dee* softly thereafter as though the measure were not quite complete without these later admissions. But occasionally this night-crowned minstrel of the snow-lands will pipe forth a whistling note or two so infinitely sweet that one pauses in his footsteps, half turning to see if it is possible that the sound is of the earth, or if, inadvertently, the doors of heaven have been left ajar. But it is then that you see that winsome sprite up there in the tree, winking his eye at you, as if saying: "Fooled you, did I? Ha-ha, thought I would!"

The chickadee specializes in the destruction of the cankerworm moth. It makes short shrift of both the female and of the eggs that later become the so-called "measuring worm," the deadliest foe of the trees in spring and early summer. The moth progeny, however, is but one of the food elements that the chickadee is after. It will pry out bark and scale insects, grubs and borers and tree lice in great quantities. The kinglet is perhaps one of the most thorough insect killers that we have among the winter birds, in that it diligently works over every inch of a limb and leaves no recess or crevice uninvestigated. Nevertheless, the chickadee is a close second; a competitor that is neck to neck with that thumb-long, golden-capped protector of the pines.

The hairy woodpecker (a familiar winter bird) is always busy ministering to the welfare of man. As a clan they have little to say, but in a material way they give a good account of themselves. I am of the belief that the brown creeper, the hairy woodpecker and the downy woodpecker are the true protectors of the apple orchards, with, of course, the chickadees working in collaboration: while the chickadees are set to work on the limbs the other three feathered investigators are busy on the trunks. Just so is apportioned the tasks in nature; as though each were given a duty to fulfill, which is done with exactness and unfailing faith. Millions of dollars are spent annually in preparations with which the fruit trees are sprayed, but were these birds encouraged to come to the orchards by the putting up of seed boxes and half-pound pieces of suet arranged here and there at convenient places the amount of good coming as a result could hardly be estimated. Apple trees in the winter contain the millions of eggs of insects that will rise like a scourge in the early summer when the leaves come forth. The time to destroy them is in the winter when they can be "nipped in the bud" at their very inception. To make an orchard a point of attraction by the setting up of feed boxes and tying suet to the limbs is to draw numbers of birds to that location. Fear not; they will not be dependent upon the seeds for their livelihood. They will feed a little on them and then instead of flying away will start in to investigate into the inner mysteries of the bark cells of the near-by trees where the tenacious insect life holds out.

The hairy woodpecker has whitish underparts with darkish upperparts. The wings are barred with white, and there is a white stripe above the eyes; likewise a white stripe under the eyes. There is a whitish stripe upon the back that identifies him.

Dryobates villosus (which is his Latin name) has a little mate, devoid of many of the markings that he possesses; for she is clothed in a demure brown coloration. This mate is received with the utmost care and attention in the summer, during the mating season, but just how scandalously he treats the mate in the winter is understood from the fact that he will make himself a den-hole with the utmost care in some convenient tree, even to lining it with choice woodland "fabrics," and will there take up winter quarters. But the mate must care for herself; probably roosting in the doorway should she be afraid of the dark. However, there is reason to believe that she, too, makes herself a winter nest. It has often been a matter of concern with me as I lay in bed at night (and especially on very cold and snappy nights) how the birds are faring. Returning home one evening in the gray, chilly dusk in late November it was my luck to notice a hairy woodpecker enter a knot-hole in the side of a tree, and since he did not come out again while I waited it was my opinion that he had "gone to roost." The next day I scaled the tree with much labor and peered in and my suspicions were proved to be borne out, for there was a nest within warm enough to baffle the most harassing gale.

(Continued next week)

Fur Farming of the Fox Ranches of Prince Edward Island

Concluded from page 3

ranchers have organized the Prince Edward Island Fox Breeders Association and have drawn up regulations to govern the classification of foxes. All the best grades are now pedigreed and classified as eligible for registration under Class A—the highest—in the record book kept by the association.

As long as the London fur market, which was the greatest in the world, was open, pelts were easily disposed of by auction at the seasonal sales held there. The prices being very satisfactory the farmers were content with the system. But when the London market was shut down, prices of pelts fell heavily and it became imperative to find new markets. There was a great demand in the United States but the conditions of marketing were very different. In London the fur auctions were open but in the United States the directors of the auctions were often also dealers and price rigging was not unknown. The fox farmers soon found that attempts to sell individually in the new market would bring poor results. So the Fox Breeders Association decided to form a fur sales board with an energetic manager in charge. Many ranchers bound themselves to sell their pelts only through it. It conducted some propaganda to dissipate prejudices against farm-bred pelts and met with excellent success in the fur markets of St. Louis and New York. In 1917 the Fur Sales Board controlled 85 per cent of the furs produced on the island of which 70 per cent were sold at an average of $250 a skin. It controls today a smaller proportion of the sales, because the London and Parisian markets are now open and individual ranchers are shipping their pelts there. This year, however, the exchange situation has dealt a heavy blow to the export trade to Europe and many pelts will go south of the border. Prices are much lower than before the war but the decline is balanced by the improvement in stock and better quality of their pelts.

There are now 3,000 foxes on Prince Edward Island farms. One ranch which the writer visited held ninety breeding pairs and seventy more for killing for their pelts before Christmas. The industry has reached a stage which enables it to support its own literature, a paper called the *Silver Fox Magazine*, having a considerable circulation. Prince Edward Island fox furs have now as established a place in the markets of the world as Californian peaches or Brazilian coffee, and the success which has attended their farming has resulted in similar ranches being established on the Canadian mainland and at various places in the United States, chiefly in Maine and Michigan. This industry has the promise of great potential wealth and is regarded with great favor by the Dominion and provincial governments which render it various kinds of assistance. And the remarkable thing is that it has been built up in a quarter of a century from a few pairs of wild foxes. It has been feared that extensive production of the silver fox pelt will depress prices but with a lower price will come increased demand and mass production and it will be a great boon to the people of the northern half of this continent if good furs can be procured at moderate prices.

Some Wonderful Fibs of Bygone Years

SAPPHO did not throw herself from the Leucadian Cliff for love of Phaon; the story of her life is false, as her respectability and purity have been established. She was a matron of the highest character, the mother of a large family.

Cleopatra did not dissolve a pearl in wine, as chemists prove it is impossible.

Hannibal did not make his way through the Alps by splitting the rocks with vinegar, as science has proved this was impossible.

Richard III was not a hunchback, but a soldier of fine form with some pretensions to good looks and great personal strength and courage.

The Pass of Thermopylae was defended, not by three hundred, but at least seven thousand Greeks, or according to some writers, twelve thousand.

The Siege of Troy was largely a myth, and even according to Homer's own account Helen must have been sixty years old when Paris fell in love with her.

Witches were never burned at Salem, Massachusetts. In the outbreak of the anti-witch fanaticism of 1691-1692, nineteen persons were hanged, but not one was burned.

Louis XVI was not the pink of dignified propriety at his execution as portrayed by the historians. He screamed for help, struggling with the executioner and beseeching mercy.

Diogenes never lived in a tub. The story that he did so has no better origin than a comment by a biographer that "a man so crabbed ought to have lived in a tub, like a dog."

The Swiss Confederation was not founded by William Tell, he did not shoot an apple from the head of his son, and even his name cannot be found in the archives of the cantons.

Alexander the Great did not weep for other worlds to conquer. There is reason to believe that his army met with a serious reverse in India that induced him to retrace his steps.

The Round Tower at Newport, Rhode Island, claimed to be associated with the viking days—a view in which Longfellow concurred—had no such association; is but an ordinary prosaic windmill of no historic importance.

Constantine was not quite the saint history terms him, for he murdered his wife, one or two of his sons, and a goodly number of his relatives. A Christian only in name, he knew little or nothing of the religion he professed.

Columbus did not make an egg stand on end to confute his opponents. The feat was performed by Brunelleschi, the architect, to silence critics who asked him how he was going to support the dome of the Cathedral of Florence.

The blood of Rizzio, Marie Stuart's favorite, cannot be seen on the floor where he was murdered by Darnley and the other conspirators. What is visible is a daub of red paint, annually renewed for the delectation of gaping tourists.

Philip III of Spain was not roasted to death by a fire, because the red tape of royal etiquette forbade any one to touch the royal person. He died a natural death. This is a stock story saddled, with variations, on many sticklers for court ceremony.

Philip VI, flying from the battlefield of Crecy, when challenged late at night before the gate of the castle of Blois, did not cry out defiantly: "It is the fortune of France," but he did say beseechingly: "Open, open, it is the unfortunate King of France."

Abbe Edgeworth never made the famous invocation to Louis XVI on the scaffold, "Son of St. Louis, ascend to heaven." He acknowledged to Lord Holland that the speech was made for him on the evening of the execution by the editor of a newspaper.

Columbus did not, on his fourth voyage to the New World, when wrecked in 1504 on the island of Jamaica, move the inhospitable and superstitious savages by predicting an eclipse of the moon as showing the displeasure of the Great Spirit. There was no lunar eclipse anywhere near the specified time.

Charles I did not sleep soundly at Whitehall on the night preceding his death, as Hume states it, undisturbed by the noise of the workman erecting his scaffold. He did not sleep at Whitehall at all that night, soundly or otherwise, but he passed the night at St. James's, far removed from sight or sound of the ghastly preparations.

Nero was not the monster that history portrays. His mother, Agrippina, was not put to death by his order, nor did he play either the harp or the fiddle while Rome burned, nor did he sing, "The Burning of Troy" on this occasion. The stories originated from Tacitus, who cordially hated Nero, and from Petronius Arbiter, who was put to death for a conspiracy against Nero.

Ballads of the Dead Year

By JOHN BENSON

Peace

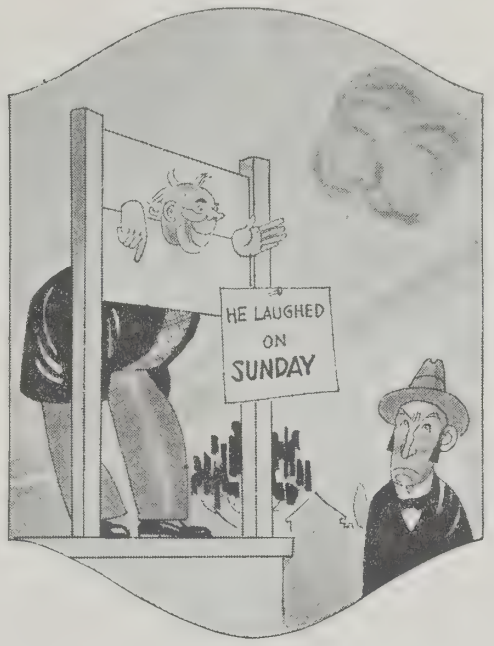
Now all the world's at peace, dear,
On this, our New Year's Day,
Yes, all the world's at peace, dear,
Except the U. S. A.
The blessed dove has come, dear,
And driven war away,
Though still the battle drum, dear,
Sounds in the U. S. A.
But though they are at peace, dear,
And war with us holds sway,
They fight and do not cease, dear—
But not the U. S. A.

Sunday

Here the News that's going,
Great big movement growing,
Going to have a Sunday like the Pilgrim Fathers had.
No more Sunday playing,
Any one caught straying
Will be popped into the cooler for a bad, bad lad.

Oh Sunday!
How I wish it was Monday,
For that is one day
That I detest!
Oh dearie
But Sunday is dreary,
And I grow weary
Of all that rest.

Everybody walking,
Even streetcars balking,
Unless you have a ticket to your pew in church.
Sunday dyed with blueing,
Nothing, nothing doing,
And if you have a pack of cards they'll come and search.



Oh Sunday!
But you are a dun day
When old Mrs. Grundy
Puts on her best.
Oh brighteyes!
I may live till the sunrise,
But tell the live guys
I died of rest.

Ships

The ships that float the Starry Flag
They must have keels of gold,
And every one of them can brag
A diamond-studded hold.
Oh, what is there that we should dread,
That we should scrimp and hoard?
A billion? Here, just take it, said
The U. S. Shipping Board.

Oh spend and spend and spend and spend,
There's more than we can use,
Just pass the money to a friend—
He wins, you cannot lose.
For folks may cry and folks may rail
In dissonant accord,
But nobody will go to jail,
Averred the Shipping Board.

If someone tries to find the dough
And where the billions went,
There's not a soul on earth will know
How anything was spent.
The war was won, we won the war.
The public can afford
A billion less, a billion more—
What's that to us, The Board?

Ireland

Saint Patrick was an Irish saint,
He drove the snakes away,
And Ireland was a quiet place
In good St. Patrick's day.

Each morning then would sally forth
A thousand Irish kings,
With followers all fully armed
With swords and clubs and things.

At every crossroads they would stand
And tunk each other's beans,
To music of the cheering of
A flock of fair colleens.

At eve they gathered up the chunks
And carted them away,
Refreshed themselves and rested then,
To fight another day.

Those peaceful days of yore are gone,
Alas, woe's me, alack!
And everybody wishes now
That they could bring them back.

Prohibition

The bootlegger slinks in the gloaming,
And the rum runners run in the night
Where once the malt liquors were foaming
Quite openly out in the light.
A year by the law of the nation
We've all been as dry as can be,
Though there has been much agitation
Because of the high price of ski.

The rum runner sits in his mansion,
The bootlegger rides in his car,
And think of their fortunes' expansion
And just how much dryer we are.
They're strong for the law of the nation,
The boys that take all they can get,
And hope till the end of creation
We never again will be wet.

Lenin

There's a tough, hard fighting burly
Ruling over Moscow town,
And they fight him late and early
But they cannot pull him down.
You may hate him, execrate him,
He's the enemy of right.
But you've got to hand it to him
That the beggar sure can fight.

Taxes

Taxes on your drinking, taxes on your food,
Taxes on your clothing and you can't go nude.
Taxes when you're walking, taxes when you ride,
Taxes on the bridegroom and upon the bride.

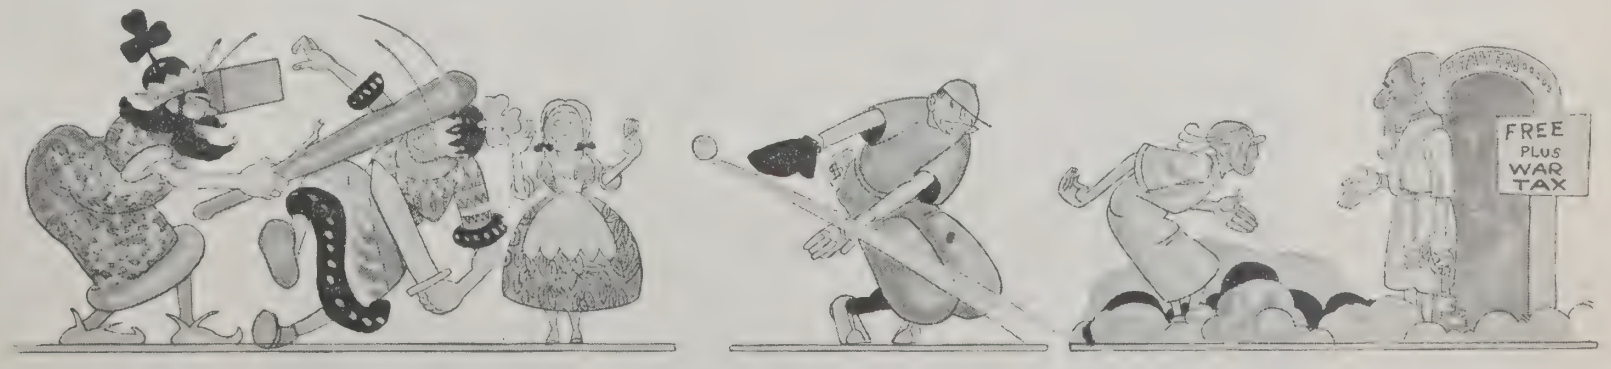
Taxes on the chickens, taxes on the cow,
Taxes on the eggs in the old haymow.
Taxes on your income, taxes on your breath,
Tax you while you're living, and then tax your death.

Venizelos

There was a chap named Venizelos,
He was the savior of his land!
All acclaimed this Venizelos
Wonderful, superb and grand!
He was a statesman and a scholar,
He was the idol of the Greeks,
Hark to the multitudes that holler
When this Venizelos speaks.

One day the Greeks held an election,
Old man Venizelos ran,
Votes that he got defied detection,
For they couldn't find the man.
Smashed their idol in the polling—
Never heard that he was that—
Set the old steam roller rolling,
Squashed poor Venizelos flat.

Baseball



Scandal, scandal, my, my, my!
Baseball's got a big black eye.
Game's been bought and sold and all,
Stuff's all off with old baseball.
Never care to see or hear—
What did Babe Ruth hit this year?

Scandal, scandal, oh, oh, oh!
Baseball's rotten, got to go.
Stars have gone and thrown their game,
Plunged it fathoms deep in shame.
Nothing in the sport to stir—
What! Ty Cobb a manager?

Normalcy

Old-fashioned ways,
Old-fashioned days,
How it delights us
To give them our praise.
How soft they look,
Times we forsook,
Future affrights us—
Let's turn back the book.

Long winter nights,
Kerosene lights,
Climb to the attic
Up three gloomy flights.
Dear station hack,
Roads soft and black,
Oh, joy ecstatic,
If they should come back.

Pushing Back the Brush Line in Wisconsin

By FRED L. HOLMES

"IF ALL acres of land cleared of stumps in Wisconsin this year by the use of war explosives were planted to potatoes they would produce over one-half the present potato crop for the state. The potatoes on the cleared land alone would be sufficient to feed 4,000,000 people one year—probably one and one-half times as many potatoes as are used annually in Wisconsin."

Mr. E. R. Jones, of the agricultural engineering department of the University of Wisconsin, thus made graphic the use of a war destructive agency applied to constructive peace-time uses. He was explaining the results obtained from using dynamite and TNT in clearing the wild cut-over lands of Northern Wisconsin. By this method 100,000 acres of land were cleared from stumps this year. At an average yield of 25 bushels to the acre this land would produce 2,500,000 bushels of wheat; or on an average of 200 bushels of potatoes to the acre it would produce 20,000,000 bushels. Here is a work that helps to obliterate the hunger line.

This is but a single application of the idea to one state situation.

The era of the lumberman is rapidly passing from the Mississippi Valley, but in its trail stand the charred stumps and tangled brush. Clear the land of this débris and it will sing with a harvest. Other states in the Mississippi Valley have the same stump problem and the lands that will ultimately be released by diverting war destructive agencies to the avenues of peace will produce crops to feed the teeming millions of the world.

"About 10,000,000 acres of cut-over lands in Northern Wisconsin are in the twilight between the lumberman's paradise and the farmer's estate," continued Mr. Jones, explaining the possibilities of this drive to push back the brush line in order to increase the world production of foodstuffs. "Beneath the jungle of fallen logs, stumps and tree tops is a soil that bids fair to do more for humanity by raising wheat for food than it did by raising logs for lumber."

Before the story is told as to how these high explosives are utilized, let us get a fuller view of the land clearing problem. It is not local; it is national. In the Mississippi Valley, in the pine belt of the South and on the Pacific Coast are thousands of acres that will ultimately yield to crop producing by the conversion of the application of dynamite from war to peace-time use.

"A low-priced and effective explosive is one of the great needs in making available for settlement the large areas of undeveloped land in the cut-over states," declared John Swenehart, who has charge of this land clearing experimental work for Wisconsin.

"A conservative estimate places the lands adapted to agriculture in the upper Mississippi River states alone at 35,000,000 acres. That this land is fertile has been shown by the thousands of settlers already on the ground. Many of these families are building farms and futures there; their greatest need is more land cleared. In most instances they have the necessary labor, but little money. Explosives they must have—the more abundant and inexpensive the shorter the road to success.

"Estimates made by the United States Soil Survey and the various colleges of agriculture show that the value of the land in these states when reclaimed will be increased by more than one million dollars. The hastening of the day when this land will be settled and under the plow will mark an epoch in the development of these districts.

"In addition to the vast area yet to be reclaimed in the upper Mississippi River Valley there are the cut-over lands of the South, which are some of the most fertile in the country. In such states as Georgia, Alabama, Louisiana and Mississippi the development of the cut-over lands represents one of the country's largest problems. While figures indicating the value of the reclamation of these lands are not available, it is obvious that the amounts are enormous

"Similarly in the Pacific Northwest there are large areas of rich land awaiting development. The part which explosives are to play in this development must be important. No matter how much machinery is available, and no matter what other methods may be devised, vast quantities of explosives will always be needed. When it is realized that the cost of developing each acre in the upper lake states and over a great portion of the southern pine land is less than the annual returns from prevailing crops, it will be evident that anything which aids in a quicker development of these resources is of national importance."

For ten years before the close of the war about 30,000 acres of land were annually cleared in Wisconsin. To do this required the use of 1,000 stump-pulling machines and 1,000,000 pounds of dynamite. The call for foods during the war awakened a new interest in land clearing. From a rainy day farm job it became a regular daily task for the homesteader. Special trains were organized by the university loaded with stump pulling machinery, accompanied by experts in the use of dynamite to teach the settler new methods of land clearing. As many as 3,000 people came to a single demonstration. In 1918 a train called the "Land Clearing Special" was operated in upper Wisconsin for 13 weeks, making 15 five-day demonstration stops in 14 counties and traveling on four different railroads.

The advantage of electric firing was established. This

Above—This acre of stumps has been charged with explosive and electrically connected for simultaneous firing.
Below—The same acre of stumps in the air following the touching of an electric button.

makes possible the distribution of the charge under a stump with a decayed top or spreading shallow roots.

Then came the signing of the armistice and within a few days the newspaper notice that 3,000,000 pounds of TNT, this high-powered war explosive, had been taken to the mid-Atlantic Ocean and dumped.

John Swenehart read the newspaper report. He was then in Northern Wisconsin helping the farmers with their land clearing problems.

"Why destroy this explosive? I believe TNT is just the thing needed to clear the lands of Northern Wisconsin," commented Mr. Swenehart to one of his superiors. And in January, 1919, he made application for the shipment of 500 pounds to be used for experimental stumping purposes.

"I made the first trials in March and by May I was satisfied that by cartridging the explosive it was less sensitive than dynamite and safer," said Mr. Swenehart. This was all pioneer work in trying this new explosive for such a purpose. Down at Pittsburgh, trials had been made on less than a dozen stumps, but it remained for Swenehart to give wide application to the stump-blowing plan by using TNT.

One day in June, 1919, Congressman A. P. Nelson, who lives in Northern Wisconsin, wired the Wisconsin College of Agriculture from Washington asking if 200,000 pounds of TNT could be used for experimental purposes in clearing land in Northern Wisconsin.

Dean H. L. Russell, head of the college, agreed. A plan was worked out to furnish the explosive to 2,000 farmers in consignments of 100 pounds each. The farmer was to have it at cost and was to make a report to the college on the results obtained.

TNT is a yellow crystalline powder, made in three grades, differing technically but not in practical application. Grade II is the one most commonly available from the war surplus. This varies in color from different manufactures, being often light yellow in color and very dry. It also may be dark brown and somewhat greasy. For practical purposes in stump work, no account need be taken of these variations in color or appearance.

In strength TNT is about one-third stronger than ordinary dynamites when loads of less than two pounds are used. If the quantity of material used in one load is more than two pounds, the TNT seems to exert a stronger effect than ordinary dynamites.

The explosive as it came from the government was in bulk form and to put the product in shape that it might be handled safely by the farmers required the establishment of a cartridging plant at Salmo, on the Bayfield Peninsula that juts out into Lake Superior. Twenty men were employed to put the explosive into condition for handling. The explosive was delivered to the farmers at a cost of eight cents a pound. And it produced commendable results. Not a man was injured. The average settler was able to use it. These experiments of 1919 fixed the policy to be followed this year.

It was found that the best results could be obtained by using dynamite and TNT together. During the year 1920 the United States Government released 550,000 pounds of TNT for use by 5,500 farmers and at the same time 2,500,000 pounds of dynamite have been utilized—over 3,000,000 pounds of war explosives. On the average it requires 30 pounds of explosives to clear an acre of land. The state is no longer required to cartridge the explosive, since this work is now being done at the Barkesdale plant of the Du Pont Powder Company.

The TNT which is stored in government warehouses at Sparta under the supervision of the War Department is released, a carload at a time, to the state for land clearing experimental purposes only upon the approval of the Secretary of War.

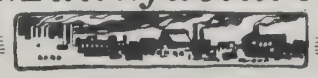
The blasting has gone on in twenty-two counties of Northern Wisconsin this year. These comprise about one-third of the area of the state. In the county of Marinette 18,000 acres were cleared this year.

"With an average of 200 bushels of potatoes to the acre, the planting of these 18,000 acres would produce a sum sufficient to pay one and one-half times the annual expense of running the United States Senate, mileage, salaries, clerk hire and printing," commented Mr. Swenehart.

In the march of civilization across the continent in the past 350 years stumps and timber have diverted settlement. First the open places were taken, and then gradually by the use of main strength clearings were made and finally the stumps uprooted by the brawn of man. Later came the use of horses and machinery for stump dentistry. More rapid methods are at hand. Where only one stump could be removed by a single effort of man or horse power, a dozen stumps, and in one case almost an acre, have been blown into the air at one time, by the use of an electric igniter.

The cost an acre varies with the number of stumps. The expense varies from $20 to $100 an acre. Lands that are worth $25 an acre with stumps sell for $100 an acre when cleared. As soon as the stumps are out of the ground, piled and burned, the land is ready for the plow.

"How applicable are the sinews of war diverted to the arts of peace! With a careful handling of dynamite and TNT, the now useless lands of the Mississippi Valley can be quickly cleared, the brush line pushed back and the food supply of the nation multiplied," declared Mr. Jones. "What the world wants is more food."



Piling up the stumps ready for burning. One hundred thousand acres have been cleared by explosives.

The Three Arts

Agriculture

Manufacture

Transportation

The Department of Agriculture tested 29,638 samples of seeds for farmers during the fiscal year ending June 30, 1920.

Forty-five export associations, with a total of 772 members representing 1,000 plants located in 42 states in the Union, are now operating under the Export Trade Act. The products exported run from clothespins to locomotives.

The Supreme Court has ordered the separation of the Lehigh Valley Railroad from its coal interests, which the court found to comprise 90,000 acres.

The United States Director of Sales announced that 44 locomotives originally built for the Russian Government are offered for sale to American railroads for $25,000 each.

Michigan and Ohio railroads have informed the Interstate Commerce Commission that failure of the state railroad bodies to grant increases in rates means an annual loss of $8,000,000.

Robert Cain, a farmer living near Peru, Indiana, has formed a company with a capital of $27,000 in which the officers and stockholders are all members of his family. Sons and daughters will, in this way, draw a share of the farm profits every year.

The American Farm Bureau Federation says: "Power farming will solve the matter of more intensive tillage and the more extensive agricultural operations necessary to the support of the country. We must look to power farming machinery for the solution of the farm labor shortage."

Fifty-five per cent of our foreign commerce is carried in American ships as compared with 8 per cent before the war.

The British department of scientific and industrial research announced the discovery of a method of drying strawberries. The product is said to have the appearance of a small reddish fig and to have the consistency of raisins.

Reports from the Pacific Coast are to the effect that this season's olive crop will be 4,000 tons lighter than that of 1919.

Advices from Australia are to the effect that thousands of returned soldiers are planting raisin grapes and that the Australia Dried Fruit Association looks for an annual production of 100,000 tons of raisins within 10 years. Australia is now producing 20,000 tons of raisins annually.

The Director of Census reports that the recent nation-wide population count cost $23,765,000.

A naval officer has informed a Senate sub-committee that a British cable company turned copies of American commercial messages over to British business men during the war, thus giving the British knowledge of the intentions of their competitors.

Canadian railway fares dropped 10 per cent, January 1, 1921.

C. Price-Green, Canadian railway commissioner, declares the prairie states of Canada will produce a billion bushels of grain in the not far distant future.

The use of motion pictures to demonstrate trade possibilities of foreign countries is proving a success. A special representative of the Chilean Government is using this method in New Orleans to convey an accurate impression of the natural resources and opportunities awaiting the American investor in that country.

Three thousand farmers have enlisted in the government's campaign to better the grade of live stock in the United States and have agreed to breed from purebred sires only.

Italy has begun actual construction work on the electrification of her railways.

The state labor commissioner of Iowa is establishing a clearing bureau where floating labor can be directed to waiting jobs.

Cuba has started to grind the new crop of sugar. There are still 250,000 tons of the old crop unsold.

Scientists in the Bureau of Plant Industry have made a movie in which the scenes are photographed through a microscope and show the activities of organisms which destroy plant life.

American shipbuilders broke pre-war launching records of the world during the last fiscal year.

The Federal Trade Commission has cited the Minneapolis Chamber of Commerce as a grain trust guilty of engaging in unfair competition. It is alleged that the chamber of commerce has a monopoly of the grain trade of Minneapolis and the immediate territory.

Early industrial returns on Canada's foreign trade for the last year indicate that her production of farm implements was more than sufficient to meet the needs of the country. The Dominion purchased foreign farm implements to the value of $878,752 but exported enough of its own manufacture to make the balance in its favor total $4,862,479.

Delegates to the National Rivers and Harbors Congress were told by an official of the Mississippi Valley Association that appropriations for inland waterways have proved wasteful because no single project has been completed.

Late prices of American coal in French markets are causing much comment. The United States is now making deliveries at $14 a ton, or $2 under the British price.

"A National Problem"

A SOBER national thought with regard to the importance, the absolute necessity of a sustained agriculture in this country is imperative. There is, perhaps, no single solution for the situation which the farmers are now facing, but there are many steps which can and should be taken to place our agriculture on a more satisfactory basis and to stabilize the business of farming, not in the interests of the farmer alone but in the interest of the nation as a whole. The matter is of such tremendous importance to our entire population that it should be recognized everywhere as a national problem and dealt with as such.—Annual report of Secretary of Agriculture.

Canadian farmers have proposed a wheat pool which will represent 8,500,000 acres, half of Canada's wheat territory. If adopted the plan will bind farmers who enter to sell only through the pool for five years.

The Pittsburgh station of the United States Bureau of Mines has developed a new fuel made of coke dust and particles of soft coal.

Official statistics show 500,000 workers are unemployed in Great Britain.

Government experts from the Department of Agriculture have completed a 9,000-mile journey through Africa in search of new plants which may be of value in the United States.

Michigan's highway department plans to build 1,000 miles of good roads each year.

Reductions in wages are announced by many industries. Shoe and woolen factories announce cuts which run as high as twenty-two and one-half per cent.

It is announced that a number of Yorkshire, England, woolen mills have accepted Russian orders for thousands of yards of textiles.

Canadian immigration totals approximately 190,000 for the past year. Ottawa announces that a considerable number of the newcomers are Polish Jews.

America's trade balance shrank $63,000,000 in November.

Philadelphia textile manufacturers have organized to resist the practice of contract cancellations.

For the first time in a third of a century one-half the officers and crews of American vessels engaged in foreign trade are American citizens.

The American Bureau of Markets reports that crop conditions in the Southern Hemisphere indicate excellent yields.

Indications are that the tariff bill now in the course of preparation will contain provisions for putting a protective tariff on farm products.

A bill has been introduced in Congress which would amend the Farm Loan Act to provide five per cent bonds in denominations of $50, $100, $500 and $1,000 and to limit series to $50,000.

The Michigan State Agricultural College, East Lansing, will soon issue a new and improved farm account book.

New census statistics show the number of farms in New Hampshire has decreased 24.1 per cent in the last ten years. In 1910 the farms of that state totaled 27,053. The census taken in 1920 places them at 20,523. The same statistics show the number of Ohio farms decreased 5.6 per cent and those of Delaware 6.4 per cent.

The Ohio Farm Bureau Federation and the state Grange plan the unification of the state-wide system of co-operative grain elevators owned by the farmers of Ohio. It is their intention to organize a $1,000,000 holding company for this purpose.

Government figures from correspondents and agents throughout the nation do not indicate a curtailment of wheat planting.

Reports compiled over a wide territory and considerable space of time show that purebred or grade dairy cows frequently earn 25 to 100 per cent more for their owners than scrub cows.

Durum wheat, introduced from Russia in 1898, now produces an annual crop worth $50,000,000. Egyptian cotton, introduced in 1901, is the basis of the long staple cotton industry of the South, and the 1919 crop was figured at $20,000,000. The Department of Agriculture introduced both of these crops.

The Bureau of Public Roads has prepared a bulletin (No. 852) on the adaption and use of concrete piping in drainage ditches or irrigation projects.

The *Scientific American* is authority for the statement that there are 350,000 tractors in use in the United States today against 40,000 at the time this country entered the World War.

Lloyd's Register reports 114 tank steamers in process of construction. The United States is building 79, the United Kingdom 32 and other countries three.

There are 25,000,000 dairy cows in the United States, from which there is produced approximately 90,000,000 pounds of milk a year.

Briefly Told

A full-blooded American Indian chief, well educated and supervisor of an Indian reservation school, is laboriously carving a totem pole, upon which is inscribed the history of the Snohomish Indian tribe. When complete the pole will stand more than one hundred feet high and will measure seven feet in diameter.

One person out of every 159 in the entire United States was on the government civil service pay roll July 31, 1920.

Between four and five million evergreen trees were felled this year to brighten American homes, churches and community centers Christmas.

It is estimated fifteen million persons will die in China this winter. In the face of this China maintains an army of a million troops.

Skyscrapers now being erected in Chile are said to be earthquakeproof.

Chinatown of London is rapidly extending. Frugal and saving habits enable the Chinese to pay rents too big for the pockets of thousands of whites. Many English girls take Chinese for their husbands. It is said, however, that the Chinese is a hard and consistent worker and proves himself a model husband.

More than 2,700,000,000 gallons of mineral oils were exported by the United States in the year 1918.

The United States Navy has one hundred ships, of various types, in process of construction.

To check automobile thieving the state of Maryland has installed in every town, hamlet and city of the state call boxes which are in direct connection with a main office in Baltimore.

An engineer in Brussels has succeeded in manufacturing artificial coal of great heating capacity from the vegetable refuse of peat beds. The new fuel is called "gasol" coal and has a heating capacity of 7,500 units and burns with a bright flame, leaving no cinders.

The war department of Honduras has purchased two American-built airplanes. During peace times the machines will be used for transporting mail over the country where there are no railroads or highways.

Coal fields and nitrate regions of Chile will soon be "bone dry" if the measure now before Parliament is adopted. The movement has the support of both laborers and employers.

Canada is buying airplanes from England for fire patrol and survey work. An attempt will also be made to use them in the seal industry.

The metallic base of ordinary clay is aluminum.

The American Institute in Berlin received from America thirteen tons of scientific, literature, the first large shipment since the war.

The Brazilian Government has recognized the government of President Alvaro Obregon, of Mexico.

The sale of worthless stock in wildcat motion picture companies amounts to more than $250,000,000 annually.

A light car with flanged wheels placed on the railroads of Alaska and drawn by dog teams is known as a "pupmobile."

A Chicago man recently made his will verbally on a phonograph record. Two attorneys dictated their names as the spoken "signatures" of witnesses.

Chicago police will use gas bombs to drive crooks into the open when they are besieged in houses by the authorities.

Counterfeiters working in the Orient are making fifty-dollar bills of dollar and two-dollar Federal Reserve notes. Original numbers are obliterated and large numerals are drawn in their place by a pen and ink artist.

Because of the alcohol they contained many navy compasses have been broken open according to the annual report of the superintendent of the Naval Observatory.

As a direct result of solar observations weather forecasts for months ahead will be possible within a few years, according to R. M. Stewart, assistant director of the Canadian Dominion Observatory.

It is believed that Mexican laborers who are smuggled across the Rio Grande in large numbers have brought the pink bollworm into Texas in their cotton bedding.

Final returns indicate that the volume of tourist travel to our national parks and monuments exceeded the million mark for the year 1920.

Caproni, the Italian airplane inventor, plans a giant plane which will carry 300 persons across the Atlantic in thirty-six hours. Provisions will be made for dining and sleeping accommodations.

The motion picture industry in America has pledged itself to raise two and one-half million dollars to aid starving children in Europe.

A Chicago woman left $3,000 to provide a home and luxuries for her pet poodle dog.

The United States Army is the smallest among the great powers.

The president of Armenia states that the help from America through the Near East Relief has saved at least 1,000,000 lives. Five hundred and sixty thousand children are being cared for.

Though oil was discovered on the farm of a mail carrier of Dallas, Texas, assuring him of an income of $15,000 a month, he reports for duty at the post office each morning with the other carriers ready for his day's work.

The homemakers' department of the Boston League of Women Voters challenges the mine owners to prove that the present prices of coal are necessary. They claim the present price tends to lower the morale and affect the welfare of 110,000,000 people.

The War Department has announced the testing of a new long-range machine-gun firing 400 to 500 bullets a minute. The gun carries a bullet five times as heavy as those fired by the Springfield rifle and will shoot about twice as far as an ordinary machine-gun.

Due to inadequate salary provision the Geological Survey service finds it almost impossible to retain in their employ technical men of high value in their specialized fields.

The natives of the Apennines boil and roast chestnuts and grind the meat into a fine flour which they use in making small cakes that are cooked between hot stones. In winter the natives go down into the city of Florence to sell their wares on the streets where trade is always brisk.

Forty out of the 48 states have adopted mothers' pensions in some form.

In England a law provides that checks written without consideration in payment of losses at gaming or for any other immoral purpose are invalid in law.

During 1919 there were 7,969 deaths caused by automobile accidents.

Diamond experts declare that weather has a great effect on precious stones. Murky, foggy days will make even the purest stone appear imperfect.

An old painting by Rembrandt was found recently in a little village in the Hartz Mountains. It is painted on an octagonal piece of oak two feet high by one and half feet wide and is still in the original frame. It was probably painted in 1630 or 1631 during Rembrandt's stay in Leiden.

Objects 45 feet beneath the surface of clear water have been successfully photographed from airplane.

An English scientist has perfected an apparatus for running electric current through milk as a substitute for pasteurization. The temperature of the milk does not rise above 148 degrees Fahrenheit and is not cooked or altered through the heating.

In effort to keep hired help on his farm of 400 acres, a Virginia farmer has installed a motion picture outfit in a cowshed, heated by wood-burning stoves and lighted by storage battery electricity. He is proving that the motion picture on the farm counteracts the drift to the cities.

King Christian, of Denmark, recently visited Pope Benedict. This is the first time since 1474 that a king of Denmark has entered the Vatican.

The Alien Flood That Perils America

This is the last of the striking series of articles that have presented the immigration problem to you. Excerpts from official reports are powerful arguments for restriction.

UNIVERSITY OF ILLINOIS LIBRARY
JAN 11 1921

The Prince With No Worlds to Conquer

Whom shall he marry? What influence can he exercise? What good did his trip to his dominions beyond the seas do? A romantic character whom his people love.

A Scandal Creditable to All

The newspaper headlines read, "When John Kissed Mary Ellen"; it's an absorbing little tale of the political power of a woman of a Far West Canadian province.

The Rise of the First Jewish Theatrical Trust

How art was prostituted to commerce. Famous actors revolted, but were beaten. "Give the Public what it wants" means that the public will have to take the kind of entertainment it can get.

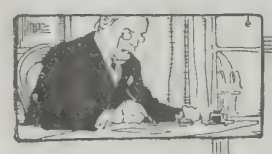
Mr. Ford's Page *The Editorials* *Briefly Told*

Many Men of Many Minds *The Three Arts*

and the many other features that go to make up THE DEARBORN INDEPENDENT?

The Wood Hollow Papers



Another chapter of the unique and altogether charming stories on the winter habits of the better known feathered visitors.

Our "Little White Navy"—Must It Go?

Do you know that the oldest branch of the service is the United States Coast Guard, which the combatant arm would swallow up?

Trinidad's Lake—on Which Men May Walk

A story on the digging out of the material used to boulevard the city—a task set in the beauties of a tropical island.

Many Men of Many Minds

A. Barton Hepburn.—Several months ago the country was in a very precarious position, because the endless circle of raising wages and raising prices was going on unabated. A wave of conservatism, inspired by the fiscal authorities, and forced by action of the reserve banks, called a halt and made people "stop, look and listen." They are now looking to the future, taking account of stock, curtailing commitments and exercising more wholesome and conservative judgment.

Corinne Lowe.—The dikes built up about America by the war have been destroyed, and as a result seas of immigration are inundating our shores. During a single day of this past autumn more than six thousand people were admitted to America through our island gateway.

Dr. R. S. MacElwee.—Prices cannot stay permanently above what the public will pay—or can pay, according to their standards of life and purchasing power—nor can prices sink permanently below the cost of production. Both of these points, however, can be moved. The cost of production may be lowered by more efficient methods of manufacture or agriculture, or mining, by mass production, by the introduction of labor saving machinery. The purchasing power of the public may be increased by increasing general prosperity.

Prices and Costs and How Both Can Be Slashed

P. Harvey Middleton.—The Britisher has learned by long experience that periods of economic depression are good times in which to lay the foundation abroad for future business, and he has learned to wait.

Andre Tardieu.—The execution of the Treaty of Versailles is necessary for the life of France.

Roger H. Williams.—When buying will again resume its regular course and how it can be stimulated to do so constitute the most serious questions before business today.

J. W. Alexander.—I am gratified to know that the great commercial, industrial and financial organizations affected are determined more than ever before to find an outlet to the sea not only by the Mississippi River and its tributaries, but by the Great Lakes as well.

Washington B. Vanderlip.—Russia must have supplies, and she wants to buy them from the United States rather than from any other country because she considers this country is the only real friend she has in the world.

George P. Brett.—If the wealth and energy now devoted so freely to golf and similar games could be used to rehabilitate our abandoned farms, and these country homes could be occupied by those of our city populations who have a little leisure and moderate means to cultivate them, and who now find it so difficult to secure homes in our large cities, it could not fail to result in incalculable value to the country at large and to the people who take up this valuable work; and it would also be the means of increasing the food supplies of the nation, which is the ever-present duty of us all.

Use Time for Golf on Farm Work, Do Country Good

H. G. Wells.—The only power capable of playing the rôle of eleventh-hour helper to Russia singled-handed is the United States of America.

Edwin A. Alderman.—Commerce has come to have a far broader meaning to the young American of today than it had before the war. A "business course" no longer means bookkeeping and the mere technicalities of mercantile routine. The young man who enters college now, contemplating a business career, has an interest that goes much deeper than that. The prominent place of international trade in the news of the day, in the discussion that goes on around him in his home, has aroused his desire to get down to bed rock. He is concerned with economic laws and principles. Geography and history are studied for the light they throw upon the great trade currents, upon the rise and fall of various industries in all parts of the world.

P. P. Claxton.—To fill both the actual vacancies and the positions held by men and women with insufficient preparation, we ought to have two hundred thousand teachers turned out from the normal and training schools every year for the next decade.

General Robert Georges Nivelle.—Treaties? Honestly, I feel that between America and France there need be none. Our interests are not in conflict and never can be; our sentiments are one, for liberty, equality, fraternity; our ideals are the same.

Sir Auckland Geddes.—It takes the best effort of the two great branches into which the "Britronord" stock has divided—the British and the American—working together in sympathy and understanding, to hold the towering structure of our civilization from collapse.

Charles Moreau Harger.—Financial interests are deeply concerned about what the farm country is doing. Almost daily come to the leading bankers of the producing states telegrams and letters from Eastern manufacturers and business men asking what is the trend of trade and the outlook for production.

Chester T. Crowell.—You must pin your faith to the proposition that there are too many sound men in this country for a few fools to ruin it.

Senator William S. Kenyon.—The greatest economic problem now before the American people for consideration is that of agriculture. During the war, 23,000 new millionaires were created. No one has heard of any farmer millionaires as a result of the war.

Colonel Guy D. Goff.—America can rise to heights unknown by any nation in the past through candid, fearless judgment, unpleasant though some of its decisions may be. A large number of our people, some of them in places of high trust, have been dishonest. Punish them. More have been incompetent. Supplant them. Prepare men who will neither be dishonest nor incompetent, meantime, by the most enlightened education that the world has ever known.

Punish Dishonest, Urges Goff, of Shipping Board

Basil Stoica.—Rumania wishes to live in peace and friendship with Hungary as with the rest of her neighbors; but the Rumanian statesmen realize that peaceful and friendly co-operation is possible only with a regenerate democratic Magyar state, and not with a régime of militarist revenge-seekers.

Samuel Rea.—Some affirmative action should be taken now that Federal authority is firmly established to permit, even to encourage, such co-operation among carriers as shall tend to eliminate the economic wastes of competition without endangering its manifest advantages to the public at large.

Major-General Charles H. Martin.—The young man from abroad who enlists in the Army for three years, provided he is of average intelligence, can be honorably discharged with a working knowledge of the English language and a common school education as well, plus a sound body, an alert mentality and an American heart.

Richard Mai.—Though the Hohenzollerns have presumably run their course, the monarchical idea is far from dead, particularly in South Germany, where the paternalism of the local rulers met with universal approval. The separation from them was very painful, above all in Baden, Hesse, and Wurttemberg, where the legislative chambers voted them the thanks of their peoples.

Floyd W. Parsons.—Our policy of burdening settlers of Alaska with prohibitive conditions instead of offering inducements has resulted in sending thousands of hardy pioneers to the other countries having a better understanding of the fundamentals of empire building. It is no fault of the Territory's physical resources that the total population of this Northland after fifty-three years of Yankee occupation is less than the number of inhabitants in an average-sized American city.

George Bernard Shaw.—The whole capitalized world is bursting with an impulse toward the "dictatorship of the proletariat," because the proletariat means simply the whole body of people who live by working as against the handful who, as the Duke of Northumberland put it, live by owning or, as Ruskin put it, by begging and stealing.

Herbert Hoover.—The test of idealism's work in a nation or an individual is the extent to which the idealism becomes concrete in service.

Frederick MacKenzie.—The vocational rehabilitation of disabled industrial workers is essentially the state's business. Each commonwealth owes this opportunity to its own citizens who need it.

Frederick A. Wallis.—We need tests that will determine whether an immigrant man or woman intends to be a real worker and a real law-abiding citizen. It undoubtedly would be a good thing if we could establish some sort of preferential selective scheme for the admission of immigrants—for instance, the admission of thousands who would go to the farms—and exclude the barterers and the lazy, for these are the classes that mostly make for radicalism. We need the man of good intentions, but we cannot establish any sort of preferential admission without first amending the Constitution of the United States.

Real Workers Are Needed, Selective Scheme Is Urged

Dr. Frank W. Gunsaulus.—Physiologically, no man is educated who is not trained to the simultaneous use of head, heart and hands. Thinking resolves all the problems of things. No heart is safe without a good head. Dream, duty and deed should go together. Mere uniformity is not unity. Man is more than a machine. Institutions were made for humanity and not humanity for institutions. The whole end and aim of education should be the unfoldment of personality. This is the American and democratic, as opposed to the Prussian and autocratic, ideal.

Dr. Joseph I. Vance.—Religion, to be worth anything, must decline to bend to business. The preacher who says what he is expected to say would better stay dumb. The sermon that offends nobody belongs on the slag dump.

J. Ogden Armour.—I do not object to destructive political opinion being expressed. I think we all ought to be given, as far as possible, the complete news on strikes, on disorders of every kind, and the actual progress, as it is fairly noted, of radicalism.

Albert J. Beveridge.—Public speaking is the highest of fine arts. An address should be merely a conversation on a large scale. Say nothing unless you actually have something to say. Make sure that you know your subject in detail. Speak so plainly that even the dullest person may understand what you are talking about. Use simple, clear language. Be so fair in your talk that your worst enemy will have to admit that you at least were fair; that you took no undue advantage of him or his party. Never argue on the side that you yourself know to be wrong or unjust.

Public Speaking Highest of Fine Arts, Says Beveridge

Alexander Graham Bell.—Light travels in waves the same as electricity, and I believe it will soon be used not only in transatlantic telephonic communication but in telephone cable work as well.

John Dos Passos.—Spanish-speaking peoples must be made to feel that there is more in the United States than ignorance and intolerance and aggression, that there is a body of opinion that puts humanity before national interests and class interests. We must outshout the priests of Baal.

A. Del Castillo.—If the police were dependable and well-disciplined, and if the middle classes understood how to help themselves, this campaign of hatred which is ruining Spain might be avoided. As it is, a day of final settlement is coming, and there is no doubt whatever but that it will be a bloody one.

The Prince With No Worlds to Conquer

By GEORGE F. KEARNEY

ALL England is still speculating as to what the Prince of Wales told Mr. Lloyd George and his cabinet on that memorable morning, two days after he returned from his tour of the Empire, when he appeared unexpectedly at Number 10 Downing Street. It was not merely a formal visit. A restless prince, fresh from a trip that was a complete diplomatic triumph, asked for bigger things to do.

When he returned home he found the English newspapers discussing how best he could further serve the Empire. Correspondents who followed him throughout his trip had privately informed their editors that the prince, while perfectly willing to do anything that the government required of him, was anxious to take a more active part in politics. Mr. Massingham in the London *Nation* had been urging that he be appointed Viceroy of Ireland in the hope that the amiable prince could bring about a friendly solution of the Irish question. The prince is understood to have given a great deal of thought to this suggestion and was willing to undertake the responsibility on condition, however, that he be given a free hand.

In other quarters it was suggested that the prince call a conference of men representing both the dominions and the colonies of the British Empire with a view to discussing the many difficult problems that have arisen in their relation to the mother country. It was felt that this would be a fitting climax to his successful trip in which he seemed to win so thoroughly the hearts of the people. The question arose here, again, as to whether the prince would be given a free hand or whether he would function merely as an agreeable figurehead.

The Prince of Wales is said to have some very definite ideas in regard to the future relation of Great Britain to the Empire. He has been keen enough to accept the perpetual ovation extended him during his recent journey in a graceful manner but he spent a great deal of his time quizzing the people he met intimately with a view to getting an understanding of the new movements that seem to be disrupting the Empire. He is the one man in all England who has attempted seriously to study the problem of the modern Empire at first hand and his viewpoint is said to be in accord with the younger school of British political thinkers. He was particularly impressed with Mr. Hughes, the Labor prime minister of Australia, and he has frequently expressed his admiration of General Smuts, of South Africa. But then, again, tradition discountenances the right of a prince to hold pronounced political views and certainly he is not expected to express any opinion that would bring him in opposition to the ideas of any of his subjects.

The Prince of Wales did not like the postponement of his trip through India until the situation there had cleared. He was eager to go anyway, and the fear for his personal safety did not please him. Moreover, it was argued that the prince's avoidance of India might be assigned to a lack of personal courage on his part and also a confession on the part of the representatives of the Crown in India that they could not cope with the situation. Certainly the prince cannot be accused of cowardice after the many experiences the British general staff had with their prince who would not stay out of the front line trenches. During the war he particularly resented the undue care taken of him and it comes as no surprise that he was disappointed at the curtailment of the trip to India.

All these things have come up for active discussion at the meeting of the cabinet and the king's privy council. They now realize that the little slip of a boy, winsome but ineffectual, whom they knew before the war, has changed.

"During those four years," the prince has said of his war experiences, "I found my manhood." Then there recurs frequently in his speeches (which he now insists upon writing himself except on very special occasions) the statement that he wants to represent in the presence of his elders the "younger generation of England." The British Empire has a new Prince of Wales, eager to play more than a polite rôle in the dark future of his nation and more confident than his ancestors that his subjects are not adverse to the active participation, along constitutional lines, of the Crown in politics.

Already the Prince of Wales has shown himself to be the strongest of his line. Edward the Seventh was a jovial king, fond of pleasure, but he did not have the mental qualities of his mother, Queen Victoria. George the Fifth's reign is frequently spoken of as the darkest of his family, for, prior to the war, there was a marked lack of enthusiasm in England for the royal family. It will be remembered that Edward the Seventh once ventured the prediction that his son George would be the last to sit on the English throne. The beginning of the present reign saw the rising tide of radicalism in England with a growing discontent with the old order sweeping over the country. There has been a strong movement for a republic for the British Empire during his reign and certainly the British Crown has had many occasions to remember that the monarchy is strictly a constitutional one. Yet the war brought the royal family into more prominence and the advisors of the king have kept him before his subjects as much as possible in always an agreeable rôle. Hence, when H. G. Wells, during the war, suggested that a republic be set up, the personal popularity of the royal family, and particularly the affection of the English people for their Prince of Wales, made his movement seem ridiculous.

As a matter of fact, the open advocacy of a republic by H. G. Wells has greatly strengthened the hand of the monarchy. It is interesting to note that the Labor party of Great Britain, planning to take over the government and make Great Britain a socialistic state, still would tolerate a royal family. Mr. J. H. Thomas, the president of the National Union of Railway and Transportation Workers, who is so frequently mentioned as the "next Labor prime minister of Great Britain," has gone to some length in his new book, "When Labor Rules," to explain that the king must be retained as an effective symbol of the nation, although the ideals of the Labor party seem at variance with the idea of special privileges granted to anyone by reason of their birth.

Had the Prince of Wales exhibited less real character during the war, the attitude of the English people toward their monarchy would have been very different. King Edward's prophecy might have come true. At best the prince, with less of his power to compel affection, would have inherited a shadowy throne. It would have been a doubtful inheritance and his plight must have been as unhappy as that of the late King Alexander of Greece. Instead, the English people are looking forward to the reign of the present Prince of Wales to restore the real dignity of the throne. He is to be a new king in the history of dynasties who will function as a champion of the common people. He is the one man in the whole Empire who does not have to struggle for his position, and, as such, he could function as a check on the ambitions of the professional politician.

(C) Underwood & Underwood

General Pershing and Prince of Wales review U. S. troops in London.

In their Prince of Wales, whom the nation worships, the English people are seeing a new hope for the future. They expect him to rule by the divine right of their love and Great Britain is weary of the type of political autocrat who wields power that would make a czar turn green with envy. They want their new monarch to symbolize their national sense of honor in an active way, for the English people are not particularly proud of the rôle their government has played recently in world politics. It is hoped that the Prince of Wales will speak with the voice of the traditional England to whom the world is very greatly indebted.

A situation arose in regard to the hunger strike of the late lord mayor of Cork which illustrates how inarticulate the Crown has become since the days of the energetic Victoria and how really a constitutional monarch could be used to reconcile warring factions within the Empire. The relatives of Terence MacSwiney petitioned King George for a clemency of the Crown. It is well known that this present king has a sympathetic attitude toward Ireland which differs slightly from the opinions held by the present ministers. The response was not made immediately and, when the king replied, one read between the lines of his note a real regret that the matter of determining whether the lord mayor should be released must be referred to the government in power. England knows that both King George and his son are in favor of a more kindly treatment of Ireland.

One gathers that the restlessness of the Prince of Wales is watched in governmental circles with very great concern. An open break between the prince and the cabinet might end disastrously for the cabinet because of the prince's personal popularity. It is significant, then, that the prince has been rebuffed by the cabinet in his desire to do a man's job for his people. Since his return from his tour of the Empire he has slipped back into his old life with its round of formalities and hunting parties. Therein lies the tragedy of a prince with no worlds to conquer.

A study of the face of the Prince of Wales gives us an insight into his present state of mind. His successes have not turned his head and there is not a haughty or a self-conscious line in his face. His eyes quiver with an interest in everybody about him. It is an intensely human countenance. A motion picture director would say of him that he had a good "screen" face, and he certainly takes an excellent picture. Yet even those pictures, and certainly his face which one sees as he rides through London, reveal a quality which we have called wistful. Study this expression a bit more closely and you will discover that there are elements of sadness that impel this wistful look. He is a prince rich in the love of his people, but a beggar indeed, when it comes to responsibilities. It is quite evident that the present government does not intend to allow the prince to fulfill his ambition to play a more vital part in the life of his nation.

What, then, is his attitude toward the perfunctory tasks that make up his everyday life? Almost every minute of the time he appears in public he is being photographed. He has been snapped under all sorts of conditions and it is remarkable that there are no pictures revealing a bored prince. Nor has he ever been known to lose his temper even under the most vexing circumstances. He has developed a genius for sensing his crowd and he always falls in with the spirit of the moment. His craftsmanship is perfect. Every public appearance yields a new incident to endear him to his people.

Not long ago he was asked by the London *Daily Mirror* to write a message to the children of the Empire in which he would embody his philosophy of life. He epitomized his whole attitude in his closing sentence when he said, "Always play the game to the end." It was, in fact, the autobiography of his past, present and future. No matter how disappointed he may be by the lack of real responsibilities, no matter how much he sighs for worlds to conquer, England has the confidence that their prince will play his game to the end. His father has a certain soured expression but it is inconceivable that the prince would ever reveal in his countenance any more than a sad wistfulness. Being pleasant is a mighty difficult job and particularly so if one is a prince. The royal family is compelled to take their recreation very seriously and a whole nation watches the young heir as a stern but kindly parent would. If he appears in uniform it must be correct in every detail. There are a hundred thousand odd points of etiquette that must be observed scrupulously by the prince. He must never forget a name or a face. He must have the history of England's countryside at his finger-tips for use in impromptu speeches. He must have an easy familiarity with the history and the work of the many institutions which he visits during the year. When entertaining a foreign diplomat he must

A Naval Holiday

THE rapidity with which the suggestion for a naval holiday is winning approval should be encouraging not only to the friends of peace but to all those who have hoped for the curtailment of government expenditures. There is no doubt that the United States today holds the balance of power in the question of whether competitive naval building programs are to continue. The only other nations which compare with us on the sea today are Great Britain and Japan. Great Britain leads us, but by so small a margin that should our present plans be carried out we will pass the ancient Mistress of the Seas within a relatively short time. Japan, building ships feverishly, claims that she is actuated purely by distrust of the naval program of the United States. Therefore the initiative in this movement lies with us.

No doubt the proposal will be treated with scorn by the proponents of the "big navy" idea, yet it is to be noticed in this connection that no less prominent an adherent of American supremacy on the seas than Secretary Daniels agrees that universal curtailment of naval expenditures would be a wise step. Mr. Daniels has said in the past that the United States must either enter the League of Nations or have a Navy second to none. But he has never said that he thought the Navy should be twice or three times its present size and strength. It might be half as large and, if Great Britain and Japan kept their force on a similar scale, provide us with exactly as much safety as it does today.

We smile at the antics of a dog which chases its own tail. What must the gods think when they see nations paralleling one another in naval building programs which cost billions of dollars but which do not change the balance of power?

It is said that for the next 25 years the annual budget of the United States Government will not fall below three and one-half billion dollars. This means that taxes will not be appreciably lighter for a quarter of a century, if ever, and that unless some stern trimming is done they may be considerably higher. Politicians may talk about reducing expenses by cutting down government departments, and what they say may sound good from the platform and perhaps win votes, but even if the pledge is carried out it will butter few parsnips for the taxpayers.

It is well, of course, to begin by saving the pennies, but why stop there? Why talk about the necessity of cutting down the number of twenty-five hundred dollar clerks in Washington and overlook twenty-five million dollar battleships?

Time to Stop This

ONE of the proudest boasts of the present century is its development of the principles of organization. Nations boast of the clock-like regularity of their railroad systems and of the ceaseless coming and going of their ships, all made possible by organization. They look back little more than a century to the prairie wagon and the sailing vessel and, comparing them with the transcontinental express and the ocean liner of today, declare that distance has been practically annihilated and that the organization of resources has been the moving agent.

Yet with hundreds of ships swinging idly at anchor and with barns and granaries in the United States and Canada bulging with the products of a great harvest, millions of people are starving to death in Europe and China—dying for want of the food which is here in surplus.

Written out on paper the proposition seems simple enough. We have more food here than we need. Other parts of the world have less food than they require. In between lie idle ships. Yet the food does not move. It is obvious that with this situation existing there is no reason for famine and that only the lack of a comprehensive plan for beating the expense is responsible.

The Navy yards wherein are built great engines of destruction resound with activity. Scientists are calculating the possibilities of new weapons of warfare to take lives in greater numbers than any known heretofore. We can organize for war, we can find the money and the means to provide for death and destruction but seemingly we are unable to perfect the machinery of organization which will make it possible for nations to save nations from famine.

Private philanthropy is the only means we appear to have discovered to date. It is not an adequate means, it never has been adequate and it never will be. As an expedient it might be applauded but as an adopted and established method it falls short. Simply because it is possible to form a bucket brigade at a fire is no reason for depending on bucket brigades to extinguish all fires.

Why not an international commission with international funds?

The World of Make-Believe

SHE was an old lady of eighty who for years had not walked a dozen steps without assistance. He was a small boy of seven, with a crippled limb, who could not move without the use of a crutch. And these two were playing hide-and-go-seek together.

"You have three chances to guess where I'm hiding, Grandma," said the boy.

The old lady chuckled. "Behind the bush," she guessed.

"No."

"Back of that chair on the piazza."

"No, but you're getting warm."

"I know, under the couch."

The boy laughed gleefully.

"You've caught me," he said. "Now it's your turn to hide, Grandma."

All the afternoon the old lady and the boy of seven played the game together without moving from their chairs. They might have sat there, sick and heartsore because of their limitations, but instead they entered the world of make-believe and the hours were full of sunshine.

What an example for those men and women who are continually complaining and bewailing what fate has brought them!

If you have big troubles, little ones, or imaginary ones, a good way to chase them from you is to take a trip into the land of make-believe.

Perhaps you are a man or woman in a country town, tied there by force of circumstances over which you have no control. You are doing your best, but the way seems irksome. You long for a wider range of vision, to travel and see the things which have so far been denied you. You want scenes besides those which are pertinent to your everyday life.

Make books your companions. Whenever you are weary of the things that are, read one which deals of distant lands. Put yourself in the place of the author and see the things he tells about, through his eyes. Make believe you are there yourself. One such trip a week will give you a new interest in life, and make the drudgery of your commonplace life easier to bear.

Perhaps you are bound to the city, with its rush and bustle and exacting conditions. You long for the hills and the fields, and day after day you must be at your desk, in the factory, the office or the store. At night take up a book like Van Dyke's "Little Rivers" and vizualize the scenes which he depicts. It won't be long before you can hear the purl of the brook and the singing of the birds in the trees, instead of the noise of the street cars, and can breathe the perfume of the flowers which nod their heads in the warm summer breeze. Make believe you are there, with the man who tells the story, and feel the exhilaration of it all.

If your troubles are real ones, and you are confined within the four walls of your room, don't sit in gloom and count the figures on the wall paper. It won't do you any good. Take courage, and a trip to the land of make-believe through the medium of books, magazines and pictures. Let poetry unfold to you a new region of thought and purpose which you have never explored before. Think of the old lady of eighty and the boy of seven who could not walk, but who found happiness through playing hide-and-go-seek, through make-believe.

The Margin of Safety

ALTHOUGH the story may be an old one, it is worth repeating, of the man who desired to engage a careful driver. There were several applicants for the position, and they were taken to where the road ran around the edge of a precipice. "Now," said the employer, "I want each one of you to tell me how near you can drive to the edge with safety."

The men walked the length of the road, examined it carefully, peered over the edge into the ravine below, and then made their reports.

"I would drive not nearer than two feet," said the first man. "I would go as close as one foot," reported another. "I am an expert driver," said the third, "I could drive within six inches of the edge with perfect safety."

The fourth man spoke slowly.

"I do not know how near to the edge I could drive with safety," he said. "I wouldn't try to find out. I would keep as far away from the edge of the cliff as possible."

He got the job.

There are many people, and their name is legion, who always try to see how near they can come to a fire and yet not get burned. They are not content to keep as far away from danger as possible, they must flirt with it. They will venture to where the sparks are flying and there is a likelihood of their getting singed and burned.

The woman who, while really upright, plays with the fire of temptation, and risks her reputation that she may enjoy the excitement of a clandestine meeting or an indiscreet act is trying to see how near to the precipice she can get without falling over and braving a plunge to the rocks below.

The young man who endangers his business position and social standing through the frequenting of questionable resorts and making companions of those who have an unsavory reputation believes that his position is so secure that he can drive near the edge of the precipice with immunity, but there is always danger that the ground may crumble and sink beneath his feet, and that he may drop into the abyss that is waiting to receive him.

The business man, the politician, the statesman, the professional man, the woman of society, the youth, the maiden of tender years, who are trying to see how near to the fire they can get without being burned, who are endeavoring to drive as close to the edge of the precipice as possible without going over, are one and all courting danger.

They are all blinded with the glamour of the game of chance which they are playing, and in which they are almost certain to lose, and go over the brink of the cliff to destruction.

One cannot play with fire without getting burned; one cannot associate with the low and vicious, even if they be garbed in the clothes of a gentleman or lady, without to some measure becoming smeared with the filth which is underneath their garments of respectability. A man or woman, a boy or girl, cannot afford to see how near to the danger line they can go before they pay the penalty.

Mock Heroics

WHEN the government of Italy finally decided to stop humoring D'Annunzio and to treat him as the rebel he was so fond of proclaiming himself, the poet changed his mind about spilling his life's blood and, according to advices, mounted his airplane and fled to safety.

A year ago the world was rather inclined to admire the daring and spirit of the poet-aviator. It is conceivable even that if the Italian Government had moved against him at Fiume when his fine frenzy was at its height, that he might have attracted so much sympathy and his friends have proved so embarrassing that there would have been a national tragedy. But the Italian Government was wise. It knew the value of waiting. It left D'Annunzio alone and the longer it ignored him the less seriously the world looked upon him.

The world likes high notes now and then but when a hero hangs to them like a curbstone quartet to a barber shop chord, common folk become weary. They would tire even of watching Napoleon standing by the sea at St. Helena or of seeing the boy munch peanuts on the burning deck.

Really, though, the world expected something better of D'Annunzio than his parting words at Fiume. "I have decided," he said, "that Italy is not worth dying for." That sentiment from a man who has been threatening every day and sometimes twice a day to spill his blood for his country, will make the world chuckle.

Even the poet's friends should be satisfied by this time that he is not a second Garibaldi.

Mr. Ford's Page

WHEN men grew tired of waiting for the wind to blow, they invented something that would take its place. For sails they substituted steam engines. For windmills they substituted force pumps. There was no objection to the wind, but there was objection to waiting for it. Men wanted something they could start themselves. They could light a fire in the steam engine and make things go. They could work the pump handle and keep water flowing. They could start things.

That is really the mark of human progress, when men can start things going, without waiting for the usual natural currents to create a movement. Some men can think; that is, they can start their mind working, they can determine when and on what problem their mind shall go to work, quite regardless of mood or liking. But other men can only receive thoughts; they are recipients, not projectors. Their minds are open stretches over which plays now cloud, now sun; they take what impressions they receive; their minds are sensitive plates, not creative dynamos.

There has been a certain amount of control achieved in the material world, but until the same degree of control is achieved in the economic and social world, we can hardly be said to have made progress.

Men no longer wait for the wind to blow, but they "wait for business to start up again."

Men no longer depend on the wind-driven pump, but they still wait for "things to take a turn."

That is, in everything but mechanical power we are still in the primitive age of our fathers. We are still dependent on the whim of the wind. If it blows, we go; if it is calm, we stand still. We speak about "business" with something of the same tone of the inevitable that we use when speaking about the weather. Panics come like rainstorms, depressions like cloudy days, prosperity like "a bright spell," for all that human beings can do with regard to controlling these things.

The question is constantly becoming more and more pressing as to the amount of control that mankind can exercise over these matters.

As a matter of fact, the heart of the problem is just in that point. It is a human cause, whether you designate it ignorance or selfishness or what not—it is human. If it be mostly ignorance, the cure is in knowledge. If it be mostly selfishness, the cure is in social-mindedness.

But the one point to be clear about is that the cause is in humanity and not in outer Nature. If the Earth had at any time failed, the basis of human society would have been wrecked beyond repair. But there have been seed time and harvest continuously, and though there have been local crop failures, never has a failure occurred that would have prevented the whole world being satisfied if transportation conditions had been equal to the need. The Earth has always yielded enough to feed the people on it; the Earth goes on doing it year by year. Even with Central China and Eastern Europe starving, there is still enough food on the earth to feed the entire human race.

Now, we may use very high-sounding names to describe the activities which engage us during this life, but the one term which describes them all is "getting a living." And a living means food, clothing, shelter. Food means agriculture; clothing means manufacture; all three mean transportation. The basis of all is the Earth; it has never failed.

And yet it cannot be denied that as long as mankind regards its economic welfare as the effect of natural forces, now blowing toward prosperity and now toward depression, there is sufficient appearance of uncontrollable fate to give color to the supposition. If things are let alone to go down to zero, they do come back; and if things are let to rage along in a riot of prosperity with no thought of the future, they do come to a fall. There is just enough to justify man's lazy supposition that "if it's to be, it's to be" and nothing that he can do can change the result.

There are economic laws, but who knows what they are? The bankers don't know. The men who would frame the laws so that a gold dollar would mean much more than a man's labor don't know. Nobody whose interest is merely himself, whose sense of prosperity ends with his own position or business, can possibly know what economic laws are. And that accounts for the various rules set up for finance and industry—wholly artificial rules—which pass as "laws," but which break down with sufficient frequency to prove that they are not even good guesses.

The basis of all economic reasoning is the Earth and its products. If these are present, you have the beginning. The process then becomes a simple use of what is on hand in order that it may reproduce itself in the necessities of life. To make the yield of the Earth, in all its forms, large enough and dependable enough to serve as the basis for real life, the life which is more than eating and sleeping, is the highest service of any economic system.

Now, just there is probably where the sprout of the next development is to be looked for. We can make things—why, the problem of production is one of the most brilliant instances of human ingenuity. We can make any number of different sort of things by the millions. The material side of our life is splendidly provided for. There are enough processes and improvements now pigeonholed and awaiting application, to bring the physical side of life to almost millennial completeness.

Then what's the trouble? Principally this: if we had advanced to a type of life which was not mainly material (although, of course, it would necessarily rest on a material basis), then our interest would naturally center there, and our only interest in the underlying material and economic processes would be to see that they worked right.

Just now, we are wrapped up in the things we are doing without being particularly concerned about the reasons why we do them. Our whole competitive system, our whole creative expression, all the play of our faculties are confined to one of the lower chambers of life, which is the chamber of material production and its by-products of success and the going standard of wealth. And it is regarded by some very short-sighted people as being to their interest that the present system never shall be perfect because it would interfere with the narrow scope of rivalry which is now afforded. It is perfectly plain why the outlook upon a standardized economic world should fill some people with dismay because of its dullness.

No need as yet to fear the dullness of a world which is in perfect economic adjustment, for mankind will never consent to perfect adjustment until he finds in a higher sphere the same outlet he now finds in the lower sphere. There was a time when part of man's business was to make fires, and keep making fires; making fires was a career to him. Then came the time when higher interests claimed him, and he wanted a fire that would burn of itself without bothering him. Finally he put his fire downstairs in a furnace where he could not even see it and where it need not trouble him more than once a day. Lately he has been putting it farther away still, in a central power house where it doesn't bother him at all. And it is all the time becoming a more perfect fire. He has grown. He now wants only the products of the fire. He does not want imperfections in his fire to distract attention from his higher interests.

Just so with mankind; it will wholly solve the economic problem when it gets an interest higher than the economic problem. Any kind of life mankind may live needs bread. Therefore, in order to prevent the question of bread breaking into his higher interest, he will come to the point where he will agree that the whole bread question ought to be placed on a standard base.

IT IS only when we get a higher interest that we require of the lower activities that they do not bother us. Most of the perfection of control which we exercise in material matters is due to our desire to get quit of them, that we may apply ourselves to things that interest us. In that way the perfection of our economic system is to come—by getting an interest so much above it, that the economic system may be freed of its blemishes in order to free us of its bother. As long as materialism constitutes our chief sphere of action and interest, its very imperfections will serve ignorance, ambition or greed. But when our interests are elevated and purified, the economic sphere will be cleaned up, because it will not then be an end in itself, but a kitchen essential. The charm of a kitchen essential is that it gives no bother.

Our "Little White Navy"—Must It Go?

By AARON HARDY ULM

HOW many persons know that the United States Government operates a "Little White Navy" for humanitarian purposes? It is the first and oldest organization in the way of a navy the country has possessed. It is a navy and it isn't. Ships make up its chief equipment and they are always prepared and ready for a fight, and in war time they become regular fighting vessels like those of the martial navy. But a fight is about the last thing that our "Little White Navy" looks for or engages in, for its prime purpose is to save, rather than destroy, life and property.

Our "Little White Navy" is known officially as the United States Coast Guard, which it became in 1915 when the United States Revenue Cutter Service and the United States Life-Saving Service were combined in a single organization. Each branch is an adjunct of government peculiar to this country, as nothing exactly like either of them is maintained by any other government. And because of that and other reasons, a fight is being made for the abolition of the Coast Guard, by letting it be swallowed whole by the regular United States Navy. In fact, the outlook for further long continued life for the historic Coast Guard isn't very good, as tremendous support has developed for the movement looking to its extinction.

The question presented is, however, of much interest, for it involves the future of a branch of government that is of more sentimental quality probably than any other branch. It also involves a problem of national policy, the militarization of a governmental activity that ordinarily has nothing to do with war—which, indeed, represents on the whole the very antithesis of war, that is, humanitarianism.

But the Navy wants the Coast Guard and most of the Coast Guard wants to get into the Navy; so if the dominant sentiment in officialdom prevails there will pass, before much longer, one of the most picturesque organizations in the world. Whatever the merits of the controversy, many who are informed on Coast Guard history will grieve to see the records closed on that organization as a separate and distinct unit of our governmental machinery.

The Coast Guard, now insignificant in strength as compared with that of its big fighting brother of the sea, is an older institution than the United States Navy itself. In the early days of the nation there was no navy, excepting the few fighting ships sent forth during the Revolution. In truth, early sentiment in the United States was rather opposed to the existence of either a navy or standing army. But the government had to have some kind of armed force to look after the ports and prevent smuggling. Alexander Hamilton, first Secretary of the United States Treasury, recommended organization of the Revenue Cutter Service, which the First Congress authorized in 1790. The list of duties first given it reflect an age that has all but passed; chiefly those duties were to suppress piracy and prevent smuggling in bulk, two evils now almost unknown. The Revenue Cutter Service also looked after the enforcement of port regulations and shipping laws in general. Gradually there was imposed on the service certain humanitarian duties that came in time to engage the bulk of its activities. At first these consisted of lending aid to vessels in distress along the coast. Ours was the first government to provide for that and virtually the only one that makes distinct provision for it now. As the country grew there came to be imposed on the Revenue Cutter Service many other duties of like kind, such as the location and destruction of derelicts on the seas, the supplying of medical assistance to fishermen on the Grand Banks and in Alaskan waters and, in recent years, the maintenance of an international ice patrol in the North Atlantic.

The crude beginnings of a Life-Saving Service were developed in connection with the Revenue Cutter Service about the middle of the last century. Ours was the first government to provide such a service for persons who risk their lives in taking care of shipping along the coast, and is virtually the only one that attends to it wholly now.

The Life-Saving Service, after it was fairly developed, branched off from the Revenue Cutter organization and became a separate unit. Its organization on its present basis is due very largely to a man now living, Sumner I. Kimball, who directed it for a period of nearly a half century. Mr. Kimball, though now in a situation of semi-retirement, is one of the oldest officials of the government, his services dating from the early sixties.

Kimball's long row of annual reports probably contains the records of more and finer adventure and heroism than will be found in imaginative form in all the novels of W. Clark Russell, Joseph Conrad and J. Fenimore Cooper. It was his custom to include a description of the chief life-saving incidents that were participated in by his men during each year. Many fiction writers have gone to his reports for material, of which he recorded enough to keep a half dozen romancers busy for a lifetime.

The Life-Saving Service evolved a code of firm traditions that will compare with those of any organization in existence. The chief one is that when other life is endangered, those in the service shall hold back from no sacrifice involved in giving relief. There are many recorded stories like that of the life-saver who served at the Shark River Station, New Jersey. There was a wreck off-shore and many sailors were on the verge of water graves. The life-saver was helping to launch a boat to go to their rescue, when a relative hastened to his side.

"Your brother is dying and wants to see you right away," said the messenger.

"Sorry, but I can't go to him now," the life-saver responded as he leaped into his boat.

One life-saver at an inland station on the Ohio River near Louisville saved more than 500 lives during his several terms of service.

Long periods of service was and still is largely customary in the Life-Saving Service. In many sections families have engaged in the work for several generations. In the Cape Hatteras area, where dangerous waters require the maintenance of many stations, members of three families have made up most of the personnel of all stations for the last fifty years.

It was from one of those stations that among the most daring of recent life-saving exploits took place. It occurred during the late days of the war when the British tank steamer Mirlo was torpedoed by a German submarine just north of Cape Hatteras. The crew had just time to leap into a couple of lifeboats before the vessel sank. Thousands of gallons of oil released from the shattered tanks, spread over the surface of the sea, caught fire; and in a moment acres of water were covered with roaring flame. Into the cauldron a United States life-saving crew, which had hastened to the spot from its station ashore, drove a power boat and rescued every endangered sailor.

(C) Chas A. Harbaugh

A Coast Guard crew going through the breakers on its way to a shipwreck. When a vessel strands close to the shore the breeches buoy is ordinarily employed to effect a rescue.

It was also a surfman belonging to the life-saving branch of the Coast Guard who drove a sled across the Seward Peninsula in the early winter of 1918 and carried relief to native communities that but for the help would probably have been depopulated by the influenza epidemic.

And it was the officers and crew from the Revenue Cutter *Unalga* that in the spring of the following year saved the population of Unalaska from destruction by the "flu."

One of the firmest traditions of both branches of the United States Coast Guard is that, though they are required to relieve only such distress as occurs on the navigable waters of the country, no call of humanity reaching it shall ever be ignored.

Hence the kinds of relief both branches give on land as well as at sea veritably run the entire gamut of distress. Life-saving crews often turn physicians and doctor persons who are stricken along the coast remote from regular physicians. They put out fires, and even pull the automobiles of careless tourists out of the mud, and never fail to take in and care for any wanderer in need who passes their way.

The property saved by the revenue cutters in the way of wrecked merchant vessels or ships in distress along the coast, totals in the tens of millions every year. The service they give is always free which means a lot to the shipping served; though they have the right to make salvage charges in cases wherein the government is imposed upon. The lives rescued from distressed vessels number in the hundreds every year. And the persons rescued from peril by the life-saving crews occupying the hundreds of stations scattered along our more than 5,000 miles of coast line are almost innumerable.

Though its humanitarian and salvage work comprises most of its activities, the Coast Guard performs many law-enforcing duties. These have to do chiefly with the Federal revenue and shipping laws. They keep order among all vessels within the three-mile limit, have the right to hail and board, and even to use force when necessary. Small guns are carried by the revenue cutters which are operated along military lines.

They look after the enforcement of regulations governing the importation of opium and assist the immigration authorities in keeping Chinese from coming into the country. One of the singular duties now imposed upon it is the prevention—so far as it can—of the clandestine importation of liquors as barred by the Eighteenth Amendment. This requires the operation of special coast patrols in several sections of the country, particularly around the Florida peninsula, on some portions of the Great Lakes and on parts of the Pacific Coast.

National prohibition to an extent has revived the ancient art or evil of smuggling in bulk. They are now using Eagle boats and submarine chasers in patrolling those coasts that are most favorable to the ways of the blockade liquor runners who, during the last year, have become quite numerous. Several vessels loading with prohibited drinkables have been overhauled as they sneaked toward obscure landing places. From one more than $4,000 worth of cognac was taken and confiscated, a few months ago.

The Coast Guard has its own fleet of vessels. They are small craft, constructed specially for the policing and rescue work they must render. They are so constructed, however, that in war time they may be taken over and operated as a part of the Navy. In fact, on the declaration of war the Coast Guard automatically becomes a part of the naval forces. It so served in the recent war during which the greatest single naval disaster involved a Coast Guard vessel, the *Tampa,* which was sunk by a submarine while doing escort duty in the English Channel. Every one of its 110 officers and men was lost.

The good record of the Coast Guard in the war gave impetus to the long-standing demand that that service be merged with the Navy in peace as well as war time.

The Navy people are almost unanimous for it. They contend that all government activity having to do with things that float, that is with the sea, should be under a single head, while in peace time the Coast Guard is an adjunct of the Treasury Department. They claim that the Navy could take over the Coast Guard equipment and, together with its own, render the same service more capably and cheaply.

The Navy is supported in its contention by a majority of the Coast Guard personnel. They claim that Coast Guard officers would have more opportunity for development, certainly more for advancement in rank, if they were naval officers.

But there are many people in the Coast Guard and outside of it who do not favor the merger. They claim that the question transcends the mere matter of economy and personal opportunity. It goes into fundamentals.

Military organizations, no matter how capable as such, are not noted for enthusiasm over or great success in any kind of practicable peace-time work that does not bear on preparation for war. Every time somebody suggests that naval vessels be employed in peace time for cargo-carrying, or other practical work, the professional naval men seem insulted. When the Navy was directed to use warships in bringing American soldiers back from France, it is said many naval officers considered it a "desecration" for a warship to be turned temporarily into an army transport.

Former Secretary of the Navy Myer opposed the absorption of the Coast Guard by the Navy on the ground that the Navy's sole business in time of peace is to prepare for war, and that peace time duties of a practical nature would weaken it as a war machine.

The Navy might not comprehend the fine humanitarian point of view that has become a tradition of the two branches of the Coast Guard; for humanitarianism and war are not very harmonious.

But the absorption of the Coast Guard would give the Navy a practicable and constructive claim on popular support, for it would then be able to point to money-saving and life-saving duties it performed during peace time intervals.

And it would give Coast Guard officers chances of high promotion they do not now possess; for the highest rank in the Coast Guard only parallels that of a lieutenant-commander in the Navy.

This Congress may decide the question, as hearings on a pending bill providing for the merger have been held. Though the question is still pending, it is one of the oldest having to do with government activities. The merger was proposed almost concurrently with the beginnings of the Navy nearly a hundred and fifty years ago and has been renewed regularly ever since.

If it finally prevails one of the most interesting, picturesque, historic and singular of government institutions will cease to be as an entity separate from war-making activities.

Above—Launching a United States Coast Guard Life-saving boat. Right—The beach patrol of the Coast Guard, burning a signal to warn a vessel away from inshore dangers; many ships are saved by these warnings. Below—The breeches buoy, probably the most used mechanism for rescuing people from vessels stranded near the shore.

The Rise of the First Jewish Theatrical Trust

Noted Actors Made Brave But Losing Fight Against the Spoliators of Theatric Art. The Harrison Grey Fiske Lawsuit

IT HAS long been known among dramatic critics that the reason for the maintenance of "Ben Hur" in the theater for nineteen years is this: it is the most successful of all the vehicles for pro-Semitism now on the stage. That will appear to be a prejudicial statement in the minds of the thousands who have seen and enjoyed "Ben Hur," but there is truth in it. The point which should not be overlooked, however, is that *if* "Ben Hur" is useful in framing the public mind favorably toward the Jews, it is not because of a pro-Semitic intention in the story. That may be the intention of the producers, Messrs. Klaw and Erlanger, but it was not the intention of General Lew Wallace.

It would seem that art and fate conspire against the propagandist play, for in no other way can the failure of avowedly pro-Semitic drama be explained. Perhaps there was never such a serious and even strenuous attempt made to force the Jewish controlled theater into the service of pro-Semitism as has been made in recent months. And the attempts, with one possible exception, have been failures. Lavishly produced, heralded by an unbroken clacque of press announcement, swathed in an initial chorus of praise, sponsored by officialdom which had been dragged out to stand godfather to the productions, they nevertheless have failed.

Be it said to the credit of the American Jew that he has been one of the causes of the failure. A most significant and hopeful sign was the reaction of the intelligent Jewish community against the attempt to utilize the stage as a hustings to boost the Jew into an unreal eminence and desirability. Certain competent Jews wrote their opinions about this with much freedom and wisdom. And they evinced a spirit which, if it could be made to permeate all Jewish activities, would quickly dispose of the Jewish Question under whatever phase it may be considered. It is this spirit of judging Jewish interests in the light of the whole which promises a helpful and lasting solution of all the differences which unfortunately have been permitted to arise between the people of Judah and the others.

Running Out the Stock Companies

THE fact of Jewish control of the theater is not of itself a ground for complaint. If certain Jews, working separately or in groups, have succeeded in wrenching this rich business from its former Gentile control, that is purely a matter of commercial interest. It is precisely on the same footing as if one group of Gentiles won the control from another group of Gentiles. It may be regarded as a business matter. In this, as in other business matters, however, there is the ethical test of *how the control was gained* and *how it is used.* Society is usually willing to receive the fact of control with equanimity, providing the control is not used for anti-social purposes.

The fact that the old-time Gentile producing managers usually died poor—Augustin Daly being about the only exception—while Jewish producing managers wax immensely wealthy (there being on this side the exception of the late Charles Frohman), would indicate that the Gentile managers were better artists and poorer business men than the Jewish managers. At least poorer business men, perhaps; and in any case working on a system whose chief object was to produce plays and not profits.

The advent of Jewish control put the theater on a more commercialized basis than it had previously known. It really represented applying the Trust Idea to the theater before it had been largely applied to industry. As early as the year 1896 the Theatrical Trust controlled 37 theaters in strategic cities. The men composing this alliance were Klaw and Erlanger, Nixon and Zimmerman, and Hayman and Frohman. All but Zimmerman were Jews, and his racial origin was a subject of dispute. This group was later joined by Rich and Harris, of Boston, and Joseph Brookes, all known as Jews.

Controlling these theaters, the Trust was able to assure a long season to both managers and playing companies. Outside the Trust, the managers and companies were left to make arrangements between each other, which resembled a species of barnstorming.

The effect on the independent theaters and managers was disastrous. The Trust boosted royalties on plays from $50 to $450 and eventually to $1,000 a week. This of itself cut off the material of the stock companies with which the independent managers endeavored to keep open their houses.

The running out of the stock companies by excessive charges for the use of plays that had already been used in the regular theaters of the Trust, really served Jewish interests in another way. The motion picture industry was coming to the front. It was a Jewish enterprise from the first. There never was any need to drive Gentiles out of that, because the Gentiles never had a chance to get in. Thus, the driving out of the stock companies threw the empty theaters over to the "movies," and the benefit was again confined to a particular racial group.

This will answer the question so frequently asked by people who wonder why the theaters they formerly saw offering plays at all seasons, are now devoting the larger part of the year to "movies."

It was not to be expected that this sort of thing could be put through without a struggle. There was a struggle and a severe one, but it is ended with what the public can see today.

The opposition offered by the artists was prolonged and dignified. Francis Wilson, Nat C. Goodwin, James A. Herne, James O'Neil, Richard Mansfield, Mrs. Fiske and James K. Hackett stood out for a time, all of them with the exception of Goodwin bound by a forfeit of $1,000 if they deserted the cause of a free theater.

Joseph Jefferson was always with the actors in this opposition and continued of the same mind to the end, playing in both Trust and anti-Trust houses.

When Nat Goodwin Surrendered

IT IS a matter of record that Nat Goodwin was the first to give in. He was the head and front of the opposition, but he had his weaknesses which were well known to the Trust, and upon these they played. One of his weaknesses was for New York engagements, and he was offered a long engagement at the Knickerbocker Theater. He was also given the promise of dates wherever and whenever he wanted them. Goodwin thereupon deserted the alliance of stars and became the henchman of the Trust. (The "Trust" was the name by which the new control was known in these days. The racial name was not given although the racial nature was plainly discerned.)

Nat Goodwin's star began to decline from that day. He made a final essay as Shylock, and with that he was practically ushered out as a headliner of the serious stage.

Richard Mansfield and Francis Wilson were delivering nightly curtain speeches against the Trust wherever they appeared, and although the public was sympathetic it was very much like the present state of affairs—what could the public do? What can an unorganized public ever do against a small, organized, determined minority? The public hardly ever appears as a party in any of the movements that concerns itself; the public is the prize for which the parties strive.

The Trust dealt strongly with Wilson. His dates were canceled. Neither his status nor his ability was of any avail to him. One of the Trust made an open statement: "Mr. Wilson is a shining mark, and we determined to make an example of him for the benefit of the lesser offenders."

Wilson's strong spirit was finally subdued to see "reason." In 1898 the Philadelphia members of the Trust offered him $50,000 for his business, and he took it.

In due time Richard Mansfield also surrendered, and Mrs. Fiske was left alone to carry on the fight.

The Dramatic Mirror Braves Judah

THE Theatrical Trust, which must be described as Jewish, because it was that, was at the beginning of the new century in full control of the field. It had reduced what was essentially an art to a time-clock, cash-register system, working with the mechanical precision of a well-managed factory. It suppressed individuality and initiative, killed off competition, drove out the independent manager and star, excluded all but foreign playwrights of established reputation, fostered the popularity of inferior talent which was predominantly Jewish, sought to debase the service of the dramatic critics of the public press, foisted countless "stars" of mushroom growth upon a helpless public while driving real stars into obscurity; it handled plays, theaters and actors like factory products, and now began a process of vulgarizing and commercializing everything connected with the theater.

If space permitted, a number of opinions could be presented here from men like William Dean Howells, Norman Hapgood and Thomas Bailey Aldrich, whose concern was for the theater, but who voiced no other observation as to the racial influences at work.

Their concern was justified. It is quite possible that many who read this article are not interested in the theater, and are, in fact, convinced that the theater is a menace. Very well. What principally makes it a menace? This—that the stage today represents the principal cultural element of 50 per cent of the people. What the average young person absorbs as to good form, proper deportment, refinement as contrasted with coarseness, correctness of speech or choice of words, customs and feelings of other nations, even fashions of clothes, as well as ideas of religion and law, are derived from what he sees and hears at the theater. The masses' sole idea of the homes and the life of the rich is derived from the stage and the movies. More wrong notions are given, more prejudices created by the Jewish controlled theater in one week, than can be charged against a serious study of the Jewish Question in a century. People sometimes wonder where the ideas of the younger generation come from. This is the answer.

As was just said, all the original opposers of this new control of the theater surrendered and left Mrs. Fiske to fight alone. She had, however, an ally in her husband, Harrison Grey Fiske, who was editor of the New York *Dramatic Mirror.*

Mrs. Fiske herself had said: "The incompetent men who have seized upon the affairs of the stage in this country have all but killed art, ambition and decency."

Her husband wrote in his paper: "What then should be expected of a band of adventurers of infamous origin, of no breeding and utterly without artistic taste? . . . . Let it be kept in mind that the ruling number of these men who compose the Theatrical Trust are absolutely unfit to serve in any but the most subordinate places in the economy of the stage and that they ought not to be tolerated even in these places except under a discipline, active, vigorous and uncompromising. Their records are disreputable and in some cases criminal, and their methods are in keeping with their records." (First printed in the *Dramatic Mirror,* December 25, 1897; reprinted March 19, 1898.)

This attack was regarded, foolishly and wrongfully of course, as an attack on the whole House of Israel and, as is always the case when one Jew is censured for wrongdoing, all the Jews in the United States came to the rescue. Pressure was brought to bear on a famous news company which handled the circulation of the most important magazines in the United States. Leading hotels were induced to withdraw the *Dramatic Mirror* from their news stands. *Mirror* correspondents were refused admittance to theaters controlled by the Trust. Any number of underground influences were set in operation to "get" Fiske and his business.

A Case That Proved Itself

SUIT was brought against Fiske for $10,000 damages for the strictures he had printed upon the personal character of certain members of the Trust. Fiske replied in his answer, setting up various facts against specific members of the Trust, their records, actions, and so on. One he accused of carrying on business under a fictitious name ("cover name," as it is known in Jewish circles). Another he accused of charging managers for advertising expenses that were never incurred. Another he accused of issuing "complimentary" tickets in which he did a private speculative business of his own, selling them and pocketing the proceeds. Another he accused of specific crime for which he had been arrested and convicted.

He charged that the Trust as a whole advertised in various cities that "the original New York company" would play, charging exorbitant admission fees on the strength of this advertisement, when in truth these were secondary companies and not the one advertised.

A strange court hearing was held in which the magistrate did not wish to hear any of Fiske's testimony, even forbidding him to enter official records of the criminal proceedings had against a certain member of the Trust. The magistrate did not seem to want to hear what Fiske based his statements upon. There was a serious shooting scrape involving a woman, but the magistrate did not want to hear about it. There was even considerable difficulty on the part of Fiske's lawyer in procuring the attendance of Abraham L. Erlanger at court, although he was one of the complainants.

All the important questions asked of Klaw were overruled.

As to Al Hayman, the court overruled all questions relating to his real name and the circumstances under which he left Australia.

The facts were not brought out in this hearing, but the whole character of the hearing was made known to the public. Fiske was bound over to the Grand Jury, with $300 bail in every allegation of libel.

The Grand Jury lost no time in dismissing all the complaints against Fiske. The Trust members had come off badly because of their evident unwillingness

Jewish World Notes

Swastika "Anti-Semitic"
Why Jewish Artists Change Their Names
Jewish Aliens Bring Most Money

Lord Reading Winces

NOTHING could more strikingly illustrate Jewish readiness to make capital out of assumed reflections on the race than a recent incident in the Criminal Court of Appeal in London. In the course of a trial, Sir Ernest Wild, counsel for the Crown, referred to the defendant as "a Jewish money lender." Lord Reading, the lord chief justice, who was sitting with Mr. Justice Darling in the case, at once hotly reprimanded the eminent barrister, declaring that the phrase was grossly improper and intended to reflect upon the Jewish race. According to the Jewish press, spectators who crowded the court room "rose and applauded" Lord Reading's criticism. American Jewish papers play up the story on their front pages under such sensational headlines as: "Lord Reading Publicly Rebukes Jew-Baiters" and "Lord Reading Cheered for Anti-Semitic Rebuke." Curiously enough in the Chicago *Israelite's* report the writer says, quite without quotation marks or sense of inconsistency: "The case was one in which a Jewish money lender was involved," using, as a matter of intelligent narration, the very term for the use of which he attacks Sir Ernest Wild as a "Jew-baiter"! Lord Darling, whose unfailing humor has lighted up many an otherwise drab day in court and who is a warm London favorite, quietly suggested when the chief justice's anger had cooled down a bit that he (Lord Darling) saw nothing improper in the Crown prosecutor's language and that he had never found fault when a witness was asked whether or not he was a Scotchman or even a Scotch money lender, although he was himself a Scotchman. But the Jewish lord chief justice insisted that the intent was to throw discredit upon the witness, "because of the general prejudice against Jews." The affair has given rise to an interesting newspaper discussion, the *Times'* comment being that Jews must not complain when a cheap witticism is made at their expense and declaring that the trouble with the Jews is that they are over-anxious to proclaim themselves as "Englishmen," while the Scotch are proud of their nationality. One Jewish writer declares that 'the word Jew was interjected by the Crown counsel to prejudice the defendant by creating on the minds of the jury the impression that only Jewish money lenders are dishonest." And quite ingenuously he goes on: "From this point of view, Lord Reading, who himself is a Jew, was right. There is prejudice against Jews and people are apt to connect that term with everything crooked and corrupt." The writer does not say why.

Cohens Many

Next to Smith, the most numerous name in the new city directory of New York is Cohen. Of the 1,096,250 names listed in the boroughs of Manhattan and the Bronx, approximately 8,000 are of the Smith clan and some 7,100 bear the name of Cohen or Cohn. The proportion of Cohens in Brooklyn would probably be larger, and if the "Gentile front" modifications of the name that have been widely adopted—such as Cowen, Cowan, Kohn, Kern, Keene, Keane, Cohan, Colby and Cahen—were included, the Smiths would possibly be outnumbered.

Jews in Harding's Cabinet?

The Jewish press has been busy with predictions of the choice by President-elect Harding of one or more Jews for his cabinet advisers. Julius Kahn, chairman of the House Committee on Military Affairs, was boomed for Secretary of War in recognition of his aid in carrying California for the Republicans. Otto H. Kahn, Jacob H. Schiff's successor as head of the great international Jewish banking firm of Kuhn, Loeb & Company, and who has been much in the limelight lately in connection with his testimony before the congressional committee on taxation, was groomed for Secretary of the Treasury, and Albert Lasker, head of a Chicago advertising agency who directed Harding's publicity bureau during the campaign, was put forward for the post of Secretary of Commerce or Interior.

The Exclusive Jew

The drastic clause in the will of the late Sir Charles Henry, by which he cut off from any share in his estate any descendant who should marry outside of the Jewish race, has suggested to the Chicago *Israelite* a contest among its readers in which $60 in prizes are provided for the best answers to the question, "What Is Your Opinion of Intermarriage?" In announcing the contest, it is asked editorially: "What spirit of self-contempt makes the Jewish young man especially believe that an alliance with a non-Jewess (almost invariably of a lower social scale) bears some peculiar dazzle and glitter? . . . . *Judaism is not merely a religion;* Judaism is a mode of living, a philosophy of life. Intermarriage always brings tears and heartbreak. The process of adjustment (no matter how much a man and woman really love one another) is difficult even when they have a common background and pretty much the same point of view. This is infinitely complicated when they thrust in differences of racial temperament, habits and customs; *a diametrically opposite way of looking at things,* a different religion and a different theology."

The Jew That Shakespeare Drew

Despite Jewish insistence in America on banishing Shakespeare's masterpiece, "The Merchant of Venice," from our public libraries and schools because of fancied "anti-Semitism" in the portrayal of the character of Shylock, Sir Sidney Lee, a Jew, is recognized in England as the greatest living Shakespearean critic and commentator, while George Brandes, a Danish Jew, also ranks high among Shakespearean scholars. Needless to add, neither of these critics shares or approves of the silliness shown by the American Jews about Shylock.

Epstein Leaves England

Jacob Epstein, the Jewish "genius" whose rashly daring and grotesque sculpture labeled "Christ" aroused such a storm of protest recently in London, is about to return to this country. Although naturalized in England, he is American-born.

Father of Psycho-Analysis a Jew

What has come to be widely known as the "Freudian Theory" of "Psycho-Analysis," which is the subject of warm controversy among psychologists on either side of the Atlantic, is the product of Dr. Sigmund Freud, a Viennese Jew.

Jewish Immigrants Bring Most Money

Although we hear much of the destitution of the Jews of Eastern Europe, Ellis Island officials state that of the immigrants coming in during the last few months the Jews outnumber all other races about two to one and bring in more money than any others, having an average of $300 each. The Dutch and Flemish come next with an average of $237; then the Swiss with $235, then the English with $214, the Polish with $190, and the Scotch, Irish, Scandinavians, French and Finnish, with an average of $119, the North Italians with $95 apiece and the South Italians with $62 and the Portuguese, $41. It is also to be taken into account that it costs the immigrants much more to cross the ocean than it did in pre-war days. Steerage fares from European ports, which used to average $25 to $27, are now up to about $110, with the exchange heavily against them. If these Eastern Jews are really destitute, who is financing the new exodus?

The Jew Hero

"Potterism," the sensational novel which is being boomed as a "best seller," has a Jewish hero—quite a striking character who "stands out like a giant among the pigmy Gentile characters in the book," according to a Jewish review.

Chanukah and Revolution

The Jews in America gave more than usual emphasis this year to the celebration of Chanukah, the Feast of Dedication, which began on the evening of December 5, and continued for eight days. The feast is celebrated in commemoration of the successful Jewish revolution led by Judas Maccabeus against the Syrian king, Antiochus IV, or Epiphanes, which filled the three years between 165 and 168 B. C. Chanukah especially marks the rededication of the Temple in Jerusalem, which signified the formal pronouncement of the re-establishment of the Independent Jewish Commonwealth. This year the Tract Commission of American Hebrew Congregations distributed widely, for the use of the Gentile press, accounts of the significance of Chanukah. Oddly enough, the celebration was simultaneous in Russia, England and America with the celebration of the anniversary of another successful revolution, that of the Russian Bolshevists.

Swastika Forbidden

Herr Haenisch, the German minister of education, has issued an order forbidding the wearing of the swastika by students. It is asserted that students had adopted this ancient symbol as an indication that the wearer had no Semitic blood in his veins. The minister takes the ground that such insignia "incite anti-Semitism."

Camouflage, Says the Chicago Israelite

Says the Chicago *Israelite:* "Not every public performer who happens to be a Jew desires that fact to be known. Indeed as a rule, Jewish artists change their names or if their cognomens sound Jewish they describe themselves as foreigners, as either Russians, Poles, Germans, Italians, Frenchmen, and so on. This is true of the women as well as of the men. Newspapermen know Jasha Heifetz, Efraim Zimbalist, Mischa Elman, Alma Gluck, Sophie Braslau, Mana Zucca, Rosa Raisa, David Warfield, Louis Mann, Clara Lippman and others prominent on the stage and the platform are Jews and Jewesses. And when that fact is pushed into the background and the managers of these artists bill them as "Russian" and "Polish" and what not, they cannot be blamed if they take these people at their own valuation. And incidentally, when Jewish comedians so-called will cease mocking Jews on the stage and refrain from singing vulgar songs in bad Yiddish and still more vile English, it will, too, help to inspire respect for the Jewish people.

Unless?

Commenting on the recent pronunciamento of the American Jewish committees against what they term "Anti-Semitism," the Chicago *Tribune* sagely remarks: "We do not think anti-Semitism will make headway in this country, unless the Jews themselves should organize *Semitism* and attempt thus to influence public policy for special causes or for particular Jewish interests."

The Rise of the First Jewish Theatrical Trust

Concluded from page 8

to meet the case. They were revealed to be a much lower type of men than the American public had supposed was in charge of the American Theater. They were shown to be a type that would not even stop at demanding the discharge of a local newspaper reporter whose critique of their plays did not please them.

The fight of the dramatic critics first against the bribery and then against the bludgeoning of the Theatrical Trust makes a story of which echoes have frequently come to the American public through the press. Conciliatory at first, with managers, actors, playwrights and critics, the Trust, as soon as it gained power, showed the claws beneath the velvet. It had the millions of dollars of the public coming its way, why should it care?

Whenever a critic opposed its methods or pointed out the inferior, coarse and degrading character of the Trust productions, he was ordered barred from the Trust's theaters, and local managers were instructed to demand his discharge from his newspaper. It is with mingled feelings that an American is compelled to relate that in many, many cases the demand was complied with, the papers being threatened with the loss of Sunday advertising! But here and there courageous writers on the Stage held to the honor of their profession and refused to be bribed or intimidated.

Writers like James S. Metcalfe, of *Life;* Hillery Bell, of the New York *Press;* Frederick F. Schrader, of the Washington *Post;* Norman Hapgood, on the New York *Evening Globe;* James O'Donnell Bennett, of the Chicago *Record-Herald,* stood out against the Trust and made their fight. Metcalfe went so far as to bring suit against the Trust for unlawful exclusion from a place of public amusement. The courts were kind to the Trust. They decided that a theater may pick its patrons. Even in very recent years the Trust has followed blacklisted dramatic critics in an effort to prevent their employment by newspapers.

The Theatrical Trust does not exist in the form it did ten years ago. It grew arrogant and bred secret enemies among its own people. A new force arose, but it also was Jewish, as it originated in the Shubert Brothers with David Belasco. Instead of one, the American people have now a dual dictatorship of the stage. The rage of the day is not plays, but playhouses. With not three plays of any character to distinguish them from the dregs of the stage, there are now building in New York alone a dozen new playhouses. The theatrical business has entered upon its real estate phase. There is money in renting chairs at the rate of $1 to $3 an hour. The renting of the chairs is a reality. The Stage is rapidly becoming an illusion.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

The Alien Flood That Perils America's Future

More Official Evidence of the Type of 1920 Immigration:

The Johnson Bill, to restrict immigration and save this country from the millions of undesirables who would leave their homes across the seas to become economic parasites sowing seeds of dissension in this country, has passed the House of Representatives.

It has gone to the Senate, and is in committee. The opponents of the measure frankly hope to "amend it to death," if they are unable to delay its passage sufficiently to permit the entrance into America of those whom they would befriend.

If you are of that American temperament that does not wish to believe the worst, will you accept the word of the United States Government, as spoken by representatives of the Department of State, who, with no axes to grind, made the reports which are appended here? And their reports, mind you, have been characterized by certain influences in this country as propaganda designed to create religious and racial prejudice!

From the majority report of the Committee on Immigration of the House:

Members of the committee found the new immigration at Ellis Island to consist practically of all nationalities except Orientals. It found by far the largest percentage of immigrants to be peoples of Jewish extraction. On the steamship New Amsterdam, sailing from Rotterdam, the committee found that 80 per cent of the steerage passengers were from Galicia, practically all of Jewish extraction. On the New Rochelle, arriving from Danzig, the committee estimated that more than 90 per cent were of the Semitic race. The committee is confirmed in the belief that the major portion of recent arrivals come without funds. It was apparent to the committee that a large percentage of those arriving were incapable of earning a livelihood. These are temporarily detained, causing great congestion, much delay, and pitiful distress, until relatives or others arrive to give bond that the newcomers will not become public charges.

A study of the new immigration from Central Europe convinced many members of the Immigration Committee that the arriving immigrants are not those who might go to the farms; that they are not agriculturists, but mainly additional population for our principal coastal cities and congested industrial districts.

Members of the committee questioned many immigrants at Ellis Island and found that most of them were bound for cities, such as New York, Detroit, Pittsburgh, Philadelphia, Cleveland, and others already crying out because of unemployment and lack of housing facilities. . . . During the one month of October, 1920, it is estimated that of the 74,665 immigrants arriving at Ellis Island, more than 75 per cent were of the Semitic race.

Excerpts from reports made to the Department of State and furnished to the Committee on Immigration at its request, submitted by Wilbur J. Carr, head of the consular service:

RUMANIA, *Bucharest.*—Possibly 10 per cent of applicants are Rumanians from Transylvania or the Old Kingdom. The remainder are Jews, mostly from Bessarabia and Bukovina, practically all, except women and children, being petty merchants or salesmen. It should also be noted that the proportion of men emigrating is increasing and that not a few are probably fugitives from Ukrainia who have managed to obtain Rumanian passports. Ninety per cent of applicants are Jews of both sexes and all ages.

AUSTRIA, *Vienna.*—Sixty per cent of the present emigrants are of the Jewish race . . . . The favorite occupation of these emigrants is merchant or clerk.

FRANCE, *Tunis.*—Mostly poverty-stricken, often illiterate, Sicilians and Maltese laborers and families, migrating to better their condition; day laborers, mechanics, masons, joiners, and similar workers and dependents.

GERMANY, *Berlin.*—It is estimated that 2,000,000 Germans desire to emigrate to the United States if passport restrictions are removed. The Germans who proceed to the United States are not of the most desirable class, due to the fact that military service is at present in most cases an absolute bar.

GREECE, *Athens.*—A great majority of the emigrants to the United States from this district are of the peasant class and represent a low form of unskilled labor. Very few of them have any trade.

ITALY, *Catania.*—A large proportion of aliens from this district going to the United States are inimical to the best interests of the American Government.

Florence.—The only really effective way of eliminating those inimical to American interests from aliens coming to America from a country so honeycombed with socialistic ideas and activities of every degree as Italy would be to suspend emigration altogether.

NETHERLANDS, *Rotterdam.*—The great mass of aliens passing through Rotterdam at the present time are Russian Poles or Polish Jews of the usual ghetto type. Most of them are more or less directly and frankly getting out of Poland to avoid war conditions. They are filthy, un-American and often dangerous in their habits.

POLAND, *Warsaw.*—Concerning the general characteristics of aliens emigrating to the United States from Poland and the occupation or trade followed by them reports indicate such to be substantially as follows:

(a) Physically deficient:—(1) Wasted by disease and lack of food supplies; (2) Reduced to an unprecedented state of life during the period of the war, as the result of oppression and want; (3) Present existence in squalor and filth.

(b) Mentally deficient:—(1) Illy educated, if not illiterate, and too frequently with minds so stultified as to admit of little betterment; (2) Abnormally twisted because of (a) reaction from war strain, (b) shock of revolutionary disorders, (c) the dullness and stultification resulting from past years of oppression and abuse.

(c) Economically undesirable:—(1) Twenty per cent is given as a round and generous estimate of productive laborers among present applicants for visés. This estimate is meant to include workers, or those who may be expected to become workers, from both sexes. The remaining percentage may be expected to be a drain on the resources of America for years; (2) Of the 50 per cent of emigrants from Poland who may be termed efficients, 40 per cent—of the total number of immigrants—will enter a trade as a middleman, not a producer. These will thrive on the efforts of their associates; (3) The productive labor, small percentage as it is, will be found in America in the sweatshops in the large centers of population. It is decidedly not agricultural, but urban in character. In this report female applicants as housewives, and so on, are of course termed as efficients.

(d) Socially undesirable:—(1) Eighty-five to ninety per cent lack any conception of patriotic or national spirit. And the majority of this percentage is mentally incapable of acquiring it. (2) Seventy-five per cent or upward will congregate in the large urban centers, such as New York or Baltimore, and add to undesirable congestion, already a grave civic problem; (3) Immigrants of similar class are to be found already in the United States who, taken as a class and not individually, have proved unassimilable; (4) All Europe is experiencing in the reaction from the war a corruption of moral standards. This may even be most noticeable in Germany. The introduction of these lowered standards cannot fail to have its evil influence in the United States.

(e) At the moment, 90 per cent may be regarded as a low estimate of the proportion representing the Jewish race among emigrants to America from Poland.

(f) The unassimilability of these classes politically is a fact too often proved in the past to bear any argument.

Excerpts from reports of officers who have visited Poland:

One immigrant aid society, which has offices in Poland, is said to be planning to send 250,000 emigrants of one race alone, the Jewish, to the United States within the next three years.

The increase of emigration from Poland raises two important questions for the United States—first, public health, and second, public safety. Many Bolshevik sympathizers are in Poland. It is difficult through visé control to keep out the undesirables.

All emigrants who pass through Danzig are decidedly inferior types, physically, mentally, and morally, and because of their insanitary habits constitute a menace to the health of all with whom they come in contact.

It is alleged that one of the reasons for the remarkable increase in the numbers of intending emigrants from Poland to the United States may be found in the activities of representatives at Warsaw of American immigrant aid societies, who are reported to have aided the emigrants to obtain passports, to have arranged for special care on trains to ports of departure, to have negotiated with steamship companies for ships to intermediate ports, and special trains to connect with the trans-Atlantic liners.

It is estimated that 350,000 Polish subjects of the Hebrew race alone are anxious to proceed to the United States for the purpose of joining relatives, or for other reasons. Another estimate places the figure of those who will attempt to reach the United States during the next three years at 5,000,000. Crowds estimated at 6,000 have at times waited before the Warsaw Consulate to obtain visés. It is impossible to overestimate the peril of the class of emigrants coming from this part of the world, and every possible care and safeguard should be used to keep out the undesirables.

CONGRESS opened December 6 with the surface prospects bright for some amendment to the immigration law which would reduce the evils which the rush of un-sorted peoples has been bringing to the United States.

For the first time a Congressional Committee showed the courage to recognize that the greatest immigration danger lay in racial undesirability rather than in individual diseases of mind and body affecting a scattered few in all races.

The House Immigration Committee in reporting favorably on the first day of the session a bill to stop all immigration excepting only parents and grandparents of persons now in the country, specifically pointed to the predominance of Jews among the present immigrants, and to the host of waiting Jews across the ocean, as the evils which must be guarded against. The House Committee's speed in presenting its remedy for the immigration troubles enheartened supporters of restrictive measures. Comfort also was obtained from the fact that in the Senate, too, a feeling was apparent that something must be done.

But—

At Ellis Island among the immigration authorities the commendable spirit manifested at Washington brought little real hope of alleviation of immigration evils.

"We have seen this early enthusiasm shown in immigration legislation on too many occasions previously," declared one of the veteran officials, "to congratulate the country at this stage. There are too many barriers before the proposed bill can become an effective law."

The seriousness of the Jewish campaign against new legislation interfering with unrestricted immigration of their race was made apparent at the time of the opening of Congress.

A few days prior to the session representatives of the garment makers' unions in New York City visited representatives of the American Federation of Labor at the Hotel Continental and asked that Jews be excepted from the proposed Congressional legislation, because of persecution of the race for religious reasons in various European countries. The New York *Times* reported the conference between the delegations, and stated that the garment makers' representatives were given an attentive hearing. The fact that the garment makers visited the American Federation of Labor representatives rather than make their addresses to Congress was in keeping with Jewish policy of seeking to obtain their objects by insidious methods rather than by open arguments. Subsequent to the garment makers' activity, announcement was made in Jewish circles in New York, that Hungarian Jews were planning to take action to combat immigration restrictions, basing their pleas on sympathetic appeals.

When the House bill prepared by Representative Johnson was favorably reported by the Immigration Committee, dispatches from Washington were sent out stating that Representative Isaac Siegel, of New York City, and Representative Adolph J. Sabath, of Chicago, would probably oppose the measure on the floor of the House. They made a minority report.

Jewish leaders were not hopeful, however, of killing the bill. It was rather by delays, substitutions and amendments that they expressed hope of accomplishing their end.

It was the fear of supporters of the Johnson Bill that the enthusiasm with which its introduction was greeted would not last. If delays in the passage of the bill in the House materialized, it was feared that the measure would fail of Senate passage.

The short session of Congress will end March 4. Ordinarily the session is given over to legislation dealing with appropriations. The imperative need of immigration legislation inspired House members to give

the Johnson Bill the right of way. The hope of enemies lies in delaying it so that it cannot reach final passage in the Senate until the last days of the session.

Then in the confusion, they hope to attach two or three harmless-looking amendments which will rob it of its teeth. The Johnson Bill is now in committee in the Senate, having passed the House.

The amendment for which the Jews hope most strongly is one excepting from the operation of the new law "any persons fleeing from religious persecution."

There is a clause to that effect in the present literacy law, but because of the fact that the literacy test itself was rendered harmless by the phrasing, the Jews have taken practically no advantage of the religious persecution exemption. Thus public attention has not been directed toward it.

From the Jewish standpoint, the insertion of a similar clause in the Johnson Bill would make the bill ideal. The law then would be, in effect, a prohibition against the admission into the United States of any persons except Jews and Armenians. The Armenian question has not been touched in these articles because Armenia like Russia is at present isolated and Armenian immigration at present is insignificant. Industrially the Armenians have been as unpopular with their neighbors as have the Jews in the lands in which they live. The reasons for the dislike of the two races are some what similar. Armenians in Turkey have been the money-lenders and the merchants and their exactions have brought prompt reprisals from the Turks. The cause of the Armenians has been pleaded in Christian countries for centuries and sympathy for them has been general.

The cause of the Turk, however, has always wanted an advocate. The Turks being Mohammedans, without propaganda or friends, have gone on under the odium of "the unspeakable Turk." The Christian world has accepted without question the Armenian side of the problem. Whether there is a Turkish side has been a question left unasked. Immigration officials at Ellis Island who have come in contact with the Armenians say, however, that they furnish a serious racial problem.

The Johnson Bill offered in the House is not the only restrictive measure presented. Senate feeling is said to favor permitting large numbers to enter the country but desires that the United States establish investigating bureaus in other countries and look into the character of individuals before granting passports.

Persons interested in the problem say that strong arguments may be made for each measure, but that neither gets at the crux of the matter.

The Johnson Bill, if enforced, would unquestionably keep out undesirables.

"But," is the inquiry, "is it wise to keep out the able-bodied, energetic, strong-minded Anglo-Saxons, Celts, Germans, Scandinavians and French who may desire to settle in this country?"

At present all the immigration officials say that it is preferable to lose the productive forces of desirable races rather than to take chances with the vast number of undesirables who predominate among present immigrants. A few years hence, should the volume of Jewish immigration lessen, the bars may be raised, say the Johnson Bill advocates.

Supporters of the Sterling Bill say that in theory it is a good one, but practically it would be worthless.

An army of agents throughout Europe would be required. For the bill to be effective, it would be necessary that every agent be absolutely honest, without political ties, above racial considerations, and utterly deaf to sympathetic appeal. Such a force of investigators, it would be manifestly impossible to obtain.

The ideal bill, say all those who have looked into the problem, would be one which excludes as undesirable any race which was deemed impossible of assimilation by America. Such a law, however, would run up against the constitutional rock forbidding class legislation.

One of the veteran immigration officials at Ellis Island points out that while the need is greatest for racial exclusion, there is another change which must come before any plan of restriction may be effectuated. It is rigid enforcement.

"Even the mild restrictions of the present law are not enforced," he said. "We are authorized to exclude persons for medical reasons, because of defective intellects, for pauperism and because they are known criminals. But our exclusion orders may be appealed to Washington. There, one man is called on to decide the question. There isn't one case in a hundred with which we deal that does not have a sympathetic aspect. Aged mothers and fathers, little children, the sick, desperate conditions in general, can be counted on to touch the heart of the assistant secretary who hears the appeal. He acts on each case, and it is natural that he feels that one person more or less will make little difference among 100,000,000. So he generally grants the appeal and the undesirable is entered.

"If a permanent court could be established to pass on appeals, the possibility of one man's honesty, political ties, or sympathetic impulses being reached, would be lessened.

"Such a court should have a tenure of office which would make it subject to no political pressure. Its members should rotate in station so that a person interested in an appeal case would not know whom to approach with pressure or influence."

Immigration officials at Ellis Island are pessimistic over the surface prospects of enactments restricting immigration.

"It's gone too long," they say. "The races interested have too much influence at Washington. Pressure will be brought to bear on newspapers which are subject to influence from heavy Jewish mercantile advertisers, such pressure as was brought to bear at the time of the propaganda for Leo Frank, who was convicted of murder in the South. The only hope lies in the possibility that the most influential Jews will fear to combat public opinion at this time and may stay the immigration tide themselves."

Supporters of immigration restriction fear another source of powerful opposition in the steamship companies. These interests have advertised widely throughout Europe. Steerage passage costs as much today as first cabin passage did a dozen years ago. Many of the steamship companies say that the fact that they can crowd so many persons below decks is the only thing that enables them to make money. The profitability of the steerage passenger business is shown by the fact that one of the large steamship companies seriously considered taking over the Leviathan, formerly the Vaterland, and refitting her solely for third class passengers.

The short session of Congress promises to be a lively one on the immigration question.

Lobbying influences from among the Jews and steamship companies are expected to be present in the committee rooms and conferences of the Congressmen.

Whether these influences behind the scenes will be sufficient to overcome by delay, amendment, "joker," or other means, strong legislation to curb undesirable immigration which public sentiment, unfortunately represented by no lobby, so clearly demands, will be an interesting development.

Important, indeed, is the question of delay, for every day's delay in the passage of a bill means the entrance of at least 3,000 more immigrants, the majority of whom are viewed by immigration officials as totally undesirable. The Johnson Bill itself gives 60 days of leeway after signing in which immigration may continue unchecked. This period assures the entry of 200,000 immigrants after Congress has declared against any further immigration.

Two Members of Congress Protest Legislation Restricting Immigration of a Type Termed Undesirable, Unassimilable and Un-American

Excerpts from the minority report on the immigration legislation, signed by Representatives Isaac Siegel, of New York, and Adolph J. Sabath, of Illinois:

There is no occasion for the extraordinary haste manifested in the attempt now made to enact this prohibitory measure without giving to it the consideration and deliberation that its importance demands. Nothing can be more unfortunate than legislation inspired by hysteria.

The majority report is especially unfortunate in its references to the number of Jewish immigrants arriving in this country. Classification according to the religion or race of immigrants is without justification. It is opposed to that Americanism that prevailed in the past. The data contained in Appendix A attached to the report are at the most ex parte statements very likely based upon information furnished by prejudiced and unfriendly local authorities.

The allusions to the Jews contained in the majority report are offensive, although we cannot believe that they are intentionally so.

We would not refer to these allusions were it not for the fact that they have a tendency to create in this country an atmosphere of prejudice against all immigrants and because of the further fact that there has recently been conducted a secret and malicious propaganda designed to arouse prejudice against the Jews in various parts of the United States.

We are opposed to this bill because it is based on unsound premises, because it is unnecessary, and because it will inevitably prove injurious to the public welfare. The creation of such a precedent as it affords will tend to legislation productive of isolation and to the retardation of our national growth.

(C) Harris & Ewing

SENATOR THOMAS STERLING, of South Dakota

As a member of the Senate Committee on Immigration, he journeyed up the bay to Ellis Island in the steerage of a liner. In company with Commissioner of Immigration Frederick A. Wallis, he obtained first-hand information, which afforded the basis for a statement that a change would be made in existing laws governing immigration.

Bald Heads and Headgear

By JOHN BURROUGHS

WHY is it that we see so many bald-headed men and so few bald-headed women? The hair of women usually becomes thinner and shorter with age, but I do not recall ever having seen one absolutely bald. The reasons are many and complex.

In the first place, women cultivate their hair; they are proud of it; the men admire it; they often use hair tonics; they rarely cut it off or discourage it; they spend much time over it. How pretty the long braids hanging down the backs of school girls, or school girls with their hair flowing free! In terms of biology, hair is a secondary sexual characteristic. It is a device to capture the male, like bare arms and bare shoulders. Blond or brunette hair, if copious enough, is equally attractive to men. In short, we have Biblical authority to the effect that if woman has long hair it is a glory to her, and what poet is it who declares that "Beauty draws us by a single hair"?

Absolutely black hair in man or woman is very rare except in certain races, for example, the North American Indians, the Japanese, and other Orientals, though I once saw an Irish-American with hair as black as a Japanese.

Woman makes much of her headgear, man very little. Ribbons and flowers and plumes adorn her head. The monster hats women wore a few years ago have about gone out, but the little affairs they wear are often "fearfully and wonderfully made." An old or shabby hat disturbs a woman much more than a man would be disturbed by one. She often brings home the body of her hat and puts on the trimming; the trimming is the all-important thing. The man wears his hat as it comes from the hatter, its only trimming being the hatband.

The hatless indoor life of women evidently favors the growth and preservation of their hair. Yet men uncover their heads under conditions wherein women do not. We doff our hats as a sign of respect or reverence. Though we may not take off our shoes on holy ground, we do carry our hats in our hands, while under the same conditions women carry theirs on their heads. For the same reason, perhaps, women's heads remain covered in churches, and all the sisters of Charity, and all so-called holy orders, are required to conceal carefully their hair. Rarely does a man sit down to lunch, even in a public restaurant, with his hat on, though women always do. Is it because our hats are so much more easily removed? We have no strings to untie nor hat pins to extract.

The baldness of men is probably largely due to their headgear. The scalp is so protected that nature ceases to provide a covering of her own. The silk or "stovepipe" hat formerly so generally worn, has much to answer for. When I was a young man it was the vogue everywhere on all occasions. In England, I remember seeing the boys at Rugby School playing ball with their "stovepipe" hats on. I myself wore one whenever I "dressed up." One's new hat came in a bandbox specially shaped for it, in which it was always kept when not in use, and, one must confess, men were then about as particular to have their hats conform to the fashion as women proverbially are about theirs. But the "stovepipe" hat, like the swallow-tailed coat, has had its day, except on formal occasions. It was later followed by the derby hat which was ubiquitous until a few years ago. I have noticed but one on a man's head in several years. The derby was as void of character as an iron pot, yet I remember Mr. Howells wore it for a time. Can one fancy Mark Twain in a derby hat? Walt Whitman always wore a broad brimmed gray, soft felt hat. One thinks of Lincoln with a stovepipe hat on, as he wore this in most of his pictures. Roosevelt liked a wide brimmed felt hat, like that of the cowboys. While he was President I once saw him going to church with a shining silk hat on his head. The first time I saw Emerson he had on a stovepipe hat, one much the worse for wear. He probably never wore any other kind. The broad brimmed, light colored Quaker hat which I used to see often in my boyhood was an improvement on the silk hat. The Cromwell hat had a character of its own, as did the three-cornered Continental hats. When a boy I remember the large black Kossuth hats much in vogue after Kossuth's visit to this country. But all such headgear is undoubtedly unfavorable to the hair crop. The use of cloth caps and soft felt hats is now almost universal among men.

When we all go bareheaded, bald heads will be fewer than they are now.

A Scandal Creditable to All

A CASUAL reader of a recent issue of the Vancouver *Province* on seeing a flaring headline, "John Kissed Mary Ellen," would probably have scented a breach of promise case, or a domestic scandal of some sort, but a perusal of the story soon would have convinced him that the incident thus described was highly creditable to both parties and left them with their reputations intact.

On December 1, there had been a general election for the provincial legislature of British Columbia, at which the old Liberal Government had been returned after a hard-fought struggle and on the third, the victorious Liberals gathered from all parts of the province in Vancouver to celebrate their victory. From Victoria, the capital which is situated on Vancouver Island, there came a strong contingent headed by the veteran premier, John Oliver, who owns the highly creditable sobriquet of "Honest John," and is the hero of the adventure above recounted.

The lady in the case is "Mary Ellen" to her familiars and the Vancouver populace but officially she is Mrs. Ralph Smith, senior member of the British Columbia legislature for Vancouver City which on December 1 had returned her at the poll well ahead of a very popular returned soldier, Captain Ian Mackenzie, and the provincial attorney-general. The newspaper story described how the premier entered the room to the strains of a brass band and pipers and how he almost started a riot by meeting "Mary Ellen" at the edge of the platform, embracing her and delivering a sound kiss in front of a wildly cheering audience. From the applause which greeted his daring performance it was plain that it excited no disapproval among his followers and that Mary Ellen was the most popular figure in the gathering. The press account asserted that "Honest John," whose years are well beyond the allotted span, blushed for several minutes but in his subsequent speech he said that the appreciation of the Vancouver electors for Mary Ellen was so complete that it was the only thing left for him to do to show his sentiment.

MRS. RALPH SMITH

Mary Ellen, the heroine of this agreeable episode, is a pleasant-faced gray-haired woman who is obviously in the late fifties or early sixties; long domiciled in Canada, she is an Englishwoman by birth, born of that fine Devonshire stock which has given so much good blood to the North American Continent. Her maiden name was Spear and in 1883 she married Ralph Smith, a clever young Northumbrian who pursued the double occupation of miner and local Methodist preacher. After they had been blessed with some children they decided to try their fortunes in a country which offered better prospects for themselves and their family and in 1892 turned to Vancouver Island where Mr. Smith found work in the mines at Nanaimo, owned by the Dunsmuir family. He had been actively interested in progressive politics before he left England and had acquired a good working knowledge of social and economic problems, of which there was no lack in his new environment. He soon made his mark as a local speaker and when in 1896 the decaying Conservative Government had to face the electorate the miners of the Nanaimo district nominated him as a Labor candidate. The Liberals of the division stood aside and gave him independent support with the result that he was one of the first pair of Labor members ever sent to Ottawa. In the years following he played a very useful part in the Federal House, and was recognized as a sane and reliable spokesman of the interests of labor. In 1916 he accepted a Liberal nomination for Vancouver and later was made minister of finance in the new Liberal cabinet. His responsibilities were heavy and there was the added anxiety of two sons in France. His health broke down and he had scarcely got into harness when he died.

Mrs. Smith's long residence at Ottawa had made her thoroughly familiar with political highways and byways. Like her husband she has not always seen eye to eye with the Liberal party and has often thought it too backward and timid. She was intensely interested in war work of various kinds and when the Liberals offered her the nomination she declined it on the ground that she was averse to stirring up party feeling in a time of national crisis. But it was another matter when she was asked to run as an independent and she accepted the honor, especially when the organizations of the soldiers' wives clamored for her to be a candidate. She was easily elected by a majority of 3,515 and took her seat on the cross benches at Victoria.

There were other independent members, but within a week "Mary Ellen" was their acknowledged leader. In no sense a conservative, she was in general sympathy with the policy of the Liberal Government which Premier Brewster had formed and which on his death Mr. Oliver carried on. But she kept a vigilant eye on their proceedings and made them pay a price for the votes of herself and her group. The price was thoroughly honorable to all parties concerned and consisted in the enactment of an extensive series of social reforms. In this department she came gradually to dominate the Oliver Government and her indorsement of a project usually meant that sooner or later it would be embodied in legislation. She is a keen temperance reformer and helped to put a measure of moderate prohibition on the statute book. She was the real author of the Mothers' Pensions Act which has brought freedom from gnawing care to scores of homes. Thanks to her efforts British Columbia now enjoys excellent laws in regard to factory inspection and she has taken a special interest in the lot of working girls. Her connection with the war has made her an indefatigable champion of the soldiers and their dependents. She is a member of almost endless boards, and no organization in her city is properly constituted unless "Mary Ellen" has some share in its control.

Her family is five in number and though all are grown, she finds time to maintain the closest of relations with them, and does not sacrifice all private ties to the exigencies of public life.

Mrs. Smith is a speaker of no mean power; flights of intellectual oratory she shuns and despises but she has fine gifts of common-sense speech and racy phrasing and an audience which she addresses will never be dull. To judge by results she is one of the most effective votegetters in Canada.

During her three sessions of the legislature she stoutly maintained her independence but she developed a great personal liking and regard for Mr. Oliver, and came to believe that she had no real excuse for not giving him definite allegiance. So she announced before the election that she would abandon her independence and take a place on the regular Liberal ticket for the city of Vancouver. At this news there was great jubilation in the Liberal and a corresponding gloom in Tory circles, for it was well known to both that "Mary Ellen" commanded the devotion of a large train of personal followers and admirers.

In Vancouver City the Conservative party had a capable leader in the former premier of the province. There is also a strong Labor party which had nominated candidates. So the Liberals viewed the polling day with some misgiving and scarcely expected to retain all the four seats they had previously held out of six. But when the votes were counted, they found to their joy that five of the six Liberal candidates headed the list and the Conservative ex-premier had only scraped in above the sixth. Nor was there any jealousy of the fact that "Mary Ellen" ran several thousands ahead of the general ticket. Their majority over all other parties is not large and if "Mary Ellen" had been either hostile or neutral, it would have gone hard with them. So the premier had every justification for his grateful salutation on the day after the victory. Mrs. Smith is now one of the political potentates of the Pacific province of Canada and it is doubtful if there is any more influential woman in Canadian public life.

What? Why? and Where?

LOOK into the faces of almost any crowd and you will see these questions unconsciously written across the countenances of thousands as they journey from rising sun to candlelight.

Their very attitude and actions indicate bewilderment, wonderment, doubt, fear—LACK OF PURPOSE!

WHAT CAN I DO? means to "hold down an easy job" to most of them. They never think of digging beneath the surface to ascertain if there is not a bigger work they can perform. Creative ideas are shunned because of the effort involved in their development.

WHY AM I HERE? finds no answer in their lives. They wander along aimlessly without motive or aim, performing their tasks in the most ordinary manner, content if only a pittance is granted out of which they may eke an existence.

WHERE AM I GOING? doesn't seem to occupy a very large place in their thoughts. It makes little difference to them which way they go, so long as they are not asked to help paddle. They prefer to float—to drift—to evade responsibilities.

Satisfied?—apparently! Contented?—never!

Let one with courage and stamina step among them and he immediately finds ample opportunity to "blaze a trail" without question from them. They prefer to stand back and look on—for isn't it easier to criticise than to create?

Lack of purpose in Life makes slaves of thousands. Their unwillingness to think—to plan—to originate—to achieve—is moulding them into plodders—victims of their own evasion.

Originality of thought, backed with initiative and sincerity of effort, would bring freedom to their minds and liberty to their souls which would make them leaders in their chosen spheres.

A little more Faith!—a little more Courage!—a little more Determination to DO and BE more than the ordinary requires, would lift millions out of their mental bondage into lives of progress, achievement and plenty.

Stop short NOW! Begin to Live for a Purpose! Get a definite aim in Life. Extend your usefulness until it touches the hearts and lives of those around you. Then, will you find the answer to WHAT?—WHY?—and WHERE? for then Life will be full of meaning for you.

The Prince With No Worlds to Conquer

Concluded from page 3

display a sympathetic interest in the history, traditions and present condition of that country. He must avoid indiscreet comments.

The prince has become a master of these little details. To this he has added his own peculiar ability to do just the right thing at the right time. If a nervous official stutters in his speech of welcome, the townspeople laugh, but the prince never could. If a lord mayor stumbles over his robes the prince must be the first to assist him and it must be done with real tact. If an accident happens in a crowd the prince must first quiet the people and then direct the removal of the injured. Moreover, the prince has become an adept at avoiding cranks without offending their feelings. In these latter days he is interviewed frequently by newspapermen and there is the inevitable photographer to deal with. He is very popular with the newspapermen and has learned to avoid awkward situations by being willing always to talk but he refuses to answer direct questions. He has developed a spirit of co-operation with newspaper photographers. He knows most of them by their first names and they never snap him until he nods assent. This is done to avoid having his picture taken with undesirable persons who would exploit a photograph showing them on familiar terms with the Prince of Wales. Many an actress or adventuress has attempted to be photographed with him, for a picture of this sort would set the whole world gossiping and make the woman's fortune. Then there is the inevitable social climber eager that her daughter shall be seen in public with the prince. The situation becomes more awkward nowadays for he prolongs his bachelorhood and hope springs high in the heart of every girl to whom he is presented on his journeys. It will be remembered that a New York girl leaped into the limelight after a dance with the prince in a way which must have pained the prince who could hardly deny his "case of love at first sight."

The life of the prince could be compared best to that of a popular actor. All the world is certainly his stage and the curtain never goes down for a respite. Sometimes he delivers set lines but frequently he must extemporize to fit an unexpected occasion. It is amazing that his triumph has been so complete, for not one of his public appearances has ended disastrously for his name. The war proved a hard school for him and he came through it all with flying colors.

Since the prince has returned home from his trip, the newspapers have been discussing the selection of his wife. It must be an odd sensation for him to pick up his morning newspaper to find there an article on whom he should marry. He frequently reads of his rumored engagement with some one he has never met, and there is not a foreign princess who comes to the English capital with whom his name is not connected.

England is not so sure that they want their prince to marry into one of the uncertain royal families of Europe. At the present time things are in a flux and it is not hard to conceive the toppling of a few more thrones. It would be very awkward for the Prince of Wales to be engaged to a princess forced into exile. In that case, England would feel obligation to interfere in behalf of his fiancée's family which might result in a declaration of war. The prince has no desire that his country shall go to war over his personal affairs.

It was suggested that his marriage to an American girl would strengthen the ties between the two English-speaking nations. The prince rather liked the idea, for it would have meant a marriage to an interesting girl. But there seemed no one girl in America who would be representative of her country. It is more than likely that had any Roosevelt girl been unmarried, and younger, an alliance with this family would have been regarded favorably even in England. He could hardly have married an American heiress with a view to pleasing the American people and an alliance with the daughter of the President would have been unwise in view of the repudiation of his foreign policies by the American people.

There appeared an editorial in the London *Times* in which the prince was urged to marry an English girl. The editorial was discreetly worded, but it stated quite plainly that the country expected him to select a wife within the next few years. It paid high tribute to the judgment of the prince and declared that the English people wanted him to be happy in his married life. It was suggested that his union should be a "marriage of inclination," and expressed the willingness of the people to accept a queen of British birth.

The truth of the matter is that the prince, like so many of his own generation, is not keen to take unto himself a wife. He is very fond of the society of girls of his own age but it is always on the "safety in numbers" principle. It is more likely that he feels, since he is given little responsibility and required merely to play around with his boon companions, that he may play as long as he can. A royal spouse brings great responsibilities, for it would increase his social engagements and greatly curtail his freedom. In his private life the Prince of Wales is a normal young man of twenty-five with a keen interest in sports. He is particularly fond of slipping off incognito to a theater party. All this, naturally, would be foregone if he married. It would mean that this comparatively happy young man would settle down to the grim business of being a prince, and finally a king.

So the Prince of Wales sighs for new worlds to conquer. Yet how different is his aim as a conqueror than that of Alexander who breathed the same sigh to his tutor Aristotle. In one case Alexander planned great military campaigns while today the Prince of Wales yearns to bring to the world a new peace, not by a sword, but through the power of his love and sympathy for the common man.

Trinidad's pitch lake.

Narrow gauge road on bamboo ties.

Trinidad's Lake—on Which Men May Walk

Digging Out the Material for the City's Smooth Boulevarding a Task of Color and Beauty Set Among Isle's Tropical Foliage

By FRANK DORRANCE HOPLEY

IMAGINE a lake that is solid! Think of a lake over which a railroad runs with no other support than the ties! Dream of a lake on which men may walk without sinking into its depths and becoming engulfed! If you can do this, you are ready to take a fanciful trip, no, not to the world of make-believe, but to a most interesting part of this hemisphere, the West Indies.

Perhaps the most prosaic work in the world is laying a city pavement. To the average citizen it means discomfort, and the closing of the street for a time. Clouds of sooty smoke from the fire-wagon, sticky shoes if one is not careful, and a huge roller rumbling along which one has to dodge, no chance for imagination, nothing but stolid, dirty work. And yet, the place from which the asphalt comes, which is used to make the pavement, is one of tropical beauty, with its brightly hued flowers, and gayly colored butterflies and birds, and, most wonderful of all, its great, brown-gray lake of pitch.

It is on the island of Trinidad, a British possession, which lies just off the coast of Venezuela, that this world wonder is to be found. How it originated, how long it has been there, and how deep it is, are all matters of speculation.

The island, with its three green hills, which suggested to Columbus the name he bestowed upon it when he discovered it in 1498, basking in the sunshine and the lazy tropical air, with the music of the soft whirr of the wings of the humming birds, would seem to be the very place where dreams are born. One of the dreams, or legends, is that of how the asphalt lake came into existence. This has been handed down the centuries, among the natives of the island.

Long, long ago, they tell us, before Columbus sailed the seas, the island was inhabited by the Carib Indians. At that time, more so than at present, the island abounded with humming birds of many different hues. These birds the Indians believed to be the spirits of their departed dead, who had returned in that guise to protect the living. They reverenced the birds, and not one of them was ever hurt or killed by an inhabitant of the island.

Then there came upon the scene a fierce tribe of Indians called the Chaymas who cared not for the superstitions of their neighbors. They made their village upon a hill overlooking the sea, and at once began to kill the humming birds in large numbers for their bright colored feathers with which they adorned themselves.

But this sacrilege could not go unpunished, the Caribs tell us. The Great Spirit who rules the happy hunting grounds of departed Indians took swift vengeance. One morning the village on the top of the hill had disappeared, and in its place was a vast, molten lake of pitch, which boiled and seethed as if heated by supernatural fires. It took a century for it to cool, so the story goes, and the lake stands today as a perpetual warning to those who would harm the humming birds.

The geologists, however, have a different story to tell.

The asphalt lake, as it is called, is in the depression or crater of an old mud spring or volcano. Here, they say, ages ago, petroleum oozed up from the depths, passing in its course through strata of extremely fine mineral matter, clay and sand, with which it became intimately mixed. Natural gas helped along this movement, and caused the emulsion of oil and clay to be churned until when it reached the surface it formed the material which today is designated as "asphalt."

That at one time the lake overflowed is reasonably certain, for deposits of the pitch have been found along the side of the hill at some distance from the lake itself. Probably, however, some of this material may have burst through the crust of the earth at some point of least resistance, and was hardened upon coming in contact with the air. This material is called "land asphalt" to distinguish it from that found in the lake, and is of inferior quality, being more weathered than that found in the original deposit.

The lake, even today, is in constant motion. Not the seething and boiling which probably characterized it at its birth, but there is a very slow, gradual movement, caused by the evolution of gas, which still continues. Through patches of rain water in small depressions in the lake, may be seen gas bubbles rising at frequent intervals. This continual movement of the lake is one of its wonders.

In area, the lake covers some 114 acres, and borings to a depth of 175 feet have been made at various distances from the center, at which depth the same quality of asphalt was found to exist as that at the surface. To bore deeper was impossible owing to the fact that the drill was bent and broken by the pressure and movement of the pitch against it at that depth.

Top—Uncovering land asphalt near Trinidad Lake.
Bottom—Dumping skip filled with asphalt into hold of vessel.

To those of a scientific turn of mind, who want to know the actual composition of the asphalt, analyses made of samples taken from many parts of the lake, have showed it to be a material of great uniformity, and composed of water, bitumen, fine silica and colloida! clay. This colloida! clay is the most wonderful part of the asphalt. It is so fine, estimated at smaller than .0001 m. m., a micron, or .000,039,37 inches in diameter, and so intimately dispersed through the bitumen, that it does not settle out, and cannot be seen in solution even under a microscope. A special attachment called the ultra-microscope has to be used, which reveals particles of sub-microscopic size. Looked at under this attachment the clay particles are never still, but are always in an active state of motion, darting from side to side with unceasing energy, with what is called by chemists the Brownman movement. It is this colloidal clay, with its enormous surface energy, that gives to the asphalt its binding qualities and durability, when used in a street pavement.

Imagine now a railroad running over the wide expanse of asphalt. Yet that is just what actually does occur. It is a narrow gauge road and the tracks are laid on ties made of bamboo wood. It has open cars on which are huge buckets, or skips as they are called, which are filled with the asphalt. The cars are run by cable to a terminal station at one end of the lake. Because of the peculiar movement of the asphalt, the tracks are often thrown out of alignment, and they have to be straightened out before the cars can run on them again.

The asphalt is dug out of the lake with picks by native laborers, the majority of whom are the regular type of West Indian Negro. The asphalt comes out in large lumps like coal, and the worker places one of these lumps, weighing perhaps 30 or 40 pounds, upon his head, walks with it to the railroad track, and throws it into one of the skips on a car, without any apparent effort.

One of the strange things about this unique lake is that, when a hole is dug in it one day, and the asphalt taken out, by the next morning it is filled up again. Within two or three days no one would know that a hole had been made there. This filling up is caused by the settling of the entire mass of the asphalt, and not from any influx of new material, as was once believed. The pitch lake, as the asphalt deposit is called in Trinidad, came into being after centuries of slow formation—asphalt is not made in a day.

There has been taken from the lake, during the fifty or more years it has been worked, more than four million tons of asphalt, and there appears to be still an inexhaustible supply, as figured by the geologists, perhaps over a billion tons. In all the time of excavation the lake has settled only some fifteen feet from its original level.

When the skips of loaded asphalt reach the terminal station they are dumped into other skips, which are conveyed by an aerial cable to the shore, along a great steel pier, extending a quarter of a mile out into the ocean, where a steamship lies waiting to be loaded. Go out along the narrow boardwalk, climb up a winding stairway, and you come to a platform perhaps forty feet above the water. The conveyor cable is guided by pulleys around the end of the pier. As each bucket comes along, a clutch is thrown off, a couple of Negroes tip it up, and the asphalt goes tumbling through a hole in the platform, down a chute into the hold of the ship.

Then another strange phenomenon takes place. The asphalt after it has been in the hold a while, fuses together again into a solid mass, just as it was in the lake itself. During the voyage it becomes quite hard, and when its destination is reached, it has to be again dug out with picks, in the same manner as it was originally won from the pitch lake, many thousands of miles away.

Hunting Locations—By JOHN B. WALLACE

IN THESE days of house scarcity in the larger cities, the man who is compelled to move is considerably out of luck. House hunting is an occupation that is apt to send chills of terror up and down the spine of the average citizen. Friend wife usually seems to enjoy it for a day or two but it soon palls even on her. What do you think then of a man who daily starts out on a search for not one house but sometimes half a dozen? And each one of these houses must come up to certain specifications. Yet he starts out most cheerfully, actually seeming to enjoy his task.

Such a man is Walter C. Reed, a location director for the largest studio at Hollywood, California. Of course he does not desire to live in these residences; merely to have pictures taken of them. But often it would be easier for him to dispossess the family and rent the premises outright than to obtain the privilege of placing a swarm of motion picture actors and actresses on the porches and lawns.

Mr. Reed, as have so many of our motion picture people, started his career on the stage. He was a comedian specializing in Irish characterizations. With Roscoe Arbuckle, who has since won fame as a motion picture star, he toured the country in musical comedy and vaudeville. Motion pictures attracted the pair and they signed up with a producer of comedies.

Those were the days of slapstick comedy in the pictures. Everybody likes to laugh at a fat man and Arbuckle because of his immense bulk and remarkable agility was what is known in theatrical parlance as "a scream." But the more delicate humor of his partner, the Irish comedian, Reed, failed to get over with the picture fans as it had on the speaking stage. No one realized this more quickly than Reed. He saw that if he wished to become a success in the pictures he would be compelled to try the game from another angle.

He studied directing, becoming co-director with Arbuckle in many of his pictures and occasionally taking a character bit himself. He specialized on stunt work and delighted in framing up trick pictures. Reed's opportunity that eventually landed him in his present position, came through Houdini. This famous illusionist and stage magician had done some work in the pictures and was under contract with the corporation with which Reed is now connected, to film a picture in which there were several under-water scenes. His director, a capable man, had had no experience in this line of work and Houdini was in a quandary until he heard of Reed. The latter's reputation for stunt stuff had spread among the studios and after a conference with the former Irish comedian the magician engaged him as his director. Previously to working with Reed, the handcuff king had risked his life in some of his death-defying feats but the new director soon showed him how to take the peril out of picture stunts. The result was one of the most remarkable pictures that has ever been filmed which, although it proved to be a financial failure, firmly established Reed's reputation as a stunt director. So cleverly had he done his work that several photographers thought he had infringed on some of their under-water photography patents until he convinced them that it was the director and not the camera that had produced certain effects.

WALTER C. REED

When Reed was engaged as location director his employers found that they had obtained a man who not only could discover locations but could fix them over to fit the needs of the story. In other words a location man was no longer a mere clerk to be given a blank check and sent out to hire a location but an expert in photography, acting and detail who ranked as a director.

With the inception of a new picture Reed is called into consultation with the director of the company that is to perform in it. The scenario is read scene by scene and Reed, notebook in hand, takes the description of the locations desired. He then seizes his camera and climbing into his automobile, sets out on his search. This is not the aimless trip, however, that the reader might imagine.

Before leaving the studio Reed has carefully gone over his files and it is seldom that he departs without having a pretty clear idea of just what he wants and just about where he will find it.

These files, the result of months of patient research, contain photographs and descriptions of every imaginable site for a picture location. Reed never leaves the studio without his camera and notebook and even on those rare occasions when he is driving simply for pleasure he will stop and snap an unusual house, building or bit of scenery that his instinct tells him may some day be desirable for a scene in a picture. He has a remarkable memory and often when a director is reading a script he will mentally place every scene in the story. Sometimes he will interrupt the reading and describe a certain location.

"That is just what I want," the director will tell him. "Nail it."

Sometimes he will find a location that is so ideal for the purposes of the story that the director will change the entire action to fit the location. It is seldom indeed that a location is found that does not need some changes. Here is where Reed's experience in camouflage comes in handy.

Suppose, for instance, that he is hunting for a certain style house, perhaps colonial, perhaps an English manor that has a brick wall about it. He may find a house that fits the action exactly but it has no brick wall or maybe it has a wall but it is so high that the camera will not photograph over it. It is then up to the technical director to build a wall or take enough bricks off the one already there so that the camera will shoot over the top. Sometimes it is necessary to build another story on the house, to add porches, or construct an entire wing.

Whenever Reed finds a place where extensive alterations are necessary the cost is computed and it is often found to be cheaper to build the set at the studio. This question of expense is always taken into consideration by Reed and he is many times able to save his employers thousands of dollars by clever devices that give the desired effect with a minimum of cost.

Reed's greatest bugbear in Southern California is the tropical and semi-tropical trees and foliage. Palms and orange groves do not fit in with New England and Canadian scenes. Often he will find the perfect type of location for which he is searching only to have it spoiled by a group of palms or an orange or lemon grove in the offing.

Scenes in which the actors are seen disporting themselves on the roofs of high office buildings, climbing hand over hand over telephone wires or tumbling down fire escapes are not nearly as perilous as would appear to the spectator who views the picture on the screen.

False ledges are built and the camera set so that they do not appear in the picture. Thus while the picture shows nothing between the actor and the street hundreds of feet below, in reality should the actor slip he would fall only a few feet. It is part of Reed's job to find buildings that would be suitable for such scenes and after he has found them to make arrangements with the owners for their use.

And it is there that the location director's hardest task confronts him. In a certain comedy picture that is now being shown on the screen Mr. Reed learned that a building would be required that had several offsets and must be at least eight stories in height. A scene in the picture was to show the principal character hanging out of a window with but a precarious hold on the sill. Obviously it would not do to allow a high priced star to run the risk of falling eight stories to the street below. Also a place had to be provided for the camera man. Finally after some search Mr. Reed found just what the director wanted. The building belonged to a large corporation and when Reed approached the manager with his request the latter would not even listen to him.

"It is impossible," he was told.

But it is for overcoming just such difficulties that Reed draws his big salary. He proceeded to point out to the corporation head the large amount of business that the corporation yearly transacted because of the existence of the film industry and the economic advantages that the community and city derived from the film colony. He also showed him how the picture could be taken on Saturday afternoon and Sunday and would not therefore disturb any of the tenants. Before he had finished he had won his point.

Mr. Reed has been compelled to forego using some wonderful locations because he could find absolutely no way to persuade the owners to allow him to use their residences. On the other hand, the studio daily receives letters from persons anxious to rent their houses for pictures. Rentals run all the way from $10 to $250 a day, depending upon how badly the director desires a location and also how much inconvenience an owner may be put to while the picture is being taken.

It is never advisable for Reed to allow an owner to know just how badly a location is needed, as often an owner will increase the price if he has reason to believe the location is indispensable.

Reed told me of a certain picture where it was desired to have several scenes in a haunted house. The moment the director read the scene in the script, Reed thought of a house he had snapped a year before while passing by on other business. He found the address in his files and drove to it. Much to his disappointment he discovered that the old house which stood on a hill and was surrounded by ghostly poplar trees had recently changed hands and the new owner had a force of carpenters on the ground engaged in renovating it. With some difficulty Reed persuaded him to forego his improvements for the present and he put the carpenters to work making the place even more ghostlike.

Reed finds that it pays to tell the truth. In fact he usually overstates the case when renting a location.

"If it is a lawn scene and we intend putting on fifty children," he explained, "I will tell them that there may be a hundred. If the owner finds less than he was led to expect he is naturally pleased and will be all the more approachable the next time we might desire to rent his place."

Reed does not intend always to be a location director. He is planning some day to go into the pictures again as an actor. But he will not have made the mistake of other stage favorites who tried to break into the game without learning the rules.

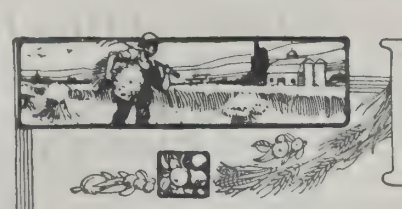
The Wood Hollow Papers

By ROBERT PAGE LINCOLN

WHERE you find the hairy woodpecker there also will you find his very near relative, the downy woodpecker. He partakes of a coloration much like that of the hairy woodpecker, but may be properly distinguished by the spot of red upon his head. There is one scraggly old tree across the way on which a pair of downies have been at work now for well nigh a month. Very early in the morning they are there and at it, beginning at the roots and working up and around it, then flying away, only to return again and again, pecking so that the bark flies. Before winter is over the insect life, dormant and in the egg, will there be at a low margin. Dead trees are a menace to any wood, for they are literally one mass of eggs of insects of all varieties; a veritable depository of parasitical life. I have no doubt but that these winter birds work over these dead trees every day in the winter and that few insects and borers are left. All dead trees should be chopped down and cut up into stove-wood.

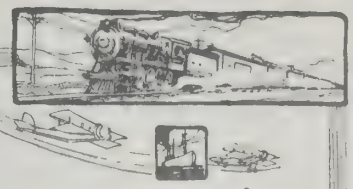
A pleasant little fellow is the downy woodpecker. You pause to watch one at work on a tree and ere you know it he has circled around to the other side of the tree out of your eyesight. You crack a stick and at once his head is thrust out at the side to see what is up; then he retreats, only to bob out at the other side to give you a questioning survey. If you should move around so as to get a glimpse of him on the side where he is working you will find that he has skillfully circled around to the other side as though fully aware of your actions. Yet no matter how he circles you can always expect to see his head bob out to get a glimpse of you, as though uncertain if he shall place you in the enemy or the well-wisher tribe.

The life of the birds is one of incessant consuming of food. Their appetite is never blunted; indigestion is certainly foreign to their indomitable constitutions. This is probably due to the fact that they do not drink coffee or smoke cigars and pipes. On insect fare they gorge themselves all day long and still are apparently ready for more. Our dank though worthy friend the toad will, in the summer, fill himself full to the brim as many as six times in a night with cutworms, slugs and various grubs—an astonishing exhibition, but this gastronomical feat of the toad is as nothing when we compare it with the birds. The voraciousness of young birds is a marvel and whoever has watched this feeding process can more fully understand the value of the birds than the superficial scholar who reckons the value of the birds in a sentimental measure forgetting the standing practical value. Beautiful as are the birds, arousing in us the most noble thoughts, there is also the material side to be considered and that is replete with facts that quell all doubts. *To say that our food supply depends upon the bird population is certainly to say the very least!*



On the coldest day (should it be twenty-four below zero) you will find the nuthatch as ever at his task of running up and down the tree trunks in quest of insect fare. The claws on his toes are made in such manner that they dig into the bark with the result that he may keep himself erect on the tree bracing himself on his stiff, feathered tail. The nuthatch is a clean-made bird, well-formed and rigid, with a slender bill with which to pry out the recalcitrant. With what deliberation this is done one will know who observes him busy at his wintry tasks. Witness how steadily hole after hole is dug and one moth egg after another is routed out; or ant upon ant is noted at the end of the bill ere they go the way of the forefathers. How many thousands are unearthed and digested throughout the day I do not know but it surely must make up a handsome figure. Most noticeable of all is the perfect freedom with which this bird runs down a tree trunk, with head thrust out to watch you. The feathers of the nuthatch lie well compressed to the body, thus providing a coat through which the winds cannot penetrate. The upperparts are slate-colored, with the underparts whitish; the wings are noticeably darker than the back, touched up with white and black. The cheeks and the underside of the neck are whitish. The top of the head and the back of the neck are darkish.

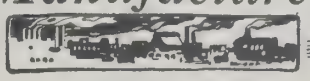
Few are aware of why the nuthatch is so named. It is not only a feeder upon insects but also adds nuts and seeds to its bill of fare. These it will ingeniously lodge in a crack or crevice and will then peck them open with the bill. The nuthatch is a singularly friendly bird and if you practice comradeship and cooperation by installing feed boxes on the grounds and attach suet at convenient places you will find the nuthatch there to give them his attention and at the same time extend to you every morning a merry "how-do-you-do." The chickadee is by far the most friendly of the winter birds and a little courting of his good will and he will, sooner or later, drop down from a limb to take a seat on your finger, pecking at the suet.



No day is bleak that has a nuthatch active in it. He is reckless of the uncompromising cold. In fact the colder the day the more it appears to his liking. He is a trim, gallant Galahad; riding upon the waves of the wintry storm and laughing his, *"Quank! yank! yank!"* into the teeth of the gale.

Familiar as is the sight of the nuthatch in the wintertime, it is rare that one sees them in the summer. During the nesting season they are seclusion-loving; they retire from the sight of men. But in the autumn (and with the coming of the first snows) they are a-wing. It is then they are in their element, speeding in their dipping flight from tree to tree on their mission of good to man.

(*Continued next week*)



The Three Arts

Agriculture

Manufacture

Transportation

A plague of locusts recently descended upon the province of Santa Fé, Argentina, destroying every green thing on the ground. They covered the earth like a moving carpet, gradually moving on to fresh pastures.

More than 125 ships have been retired from active operation by the Shipping Board.

Statistics published by the government of Japan show that America sent more visitors to that country during the first six months than came from any other nation.

A government publication reports that German commercial firms are soliciting trade in Mexico and that they offer credit up to one year.

A fuel economy test run in France was by a sedan which covered 136 miles on 4.8 gallons of gas.

The Canadian Government will audit the books of large coal companies in Alberta and British Columbia.

A number of hosiery manufacturers have been cited by the Federal Trade Commission on charges of having misbranded their products.

The tuber moth is prevalent in many sections of California, and Oregon is taking protective measures to keep it out of that state. The potato growers of Oregon do not wish to injure California but they all agree that stringent measures must be adopted.

The fundamental principles underlying the raising of the standard of farm stock are outlined in Department Bulletin 905 of the Department of Agriculture. It may be procured from the Superintendent of Documents, Washington, for 15 cents.

Owing to the depressed conditions in ocean transportation more than twenty privately owned American steamships are tied up.

The Interstate Commerce Commission has approved the merger of the Adams, American, Wells-Fargo and Southern Express companies.

Foreign and domestic trade in Vladivostok is reported to be exceedingly dull. The residents are afraid to buy more than enough for their immediate need because of the great number of robberies.

There is one automobile for every 14 persons in the United States.

Forty-six per cent of the coal mined in the United States goes to the railroads, the gas works and to the coal mines for operating purposes.

The New York Federal Reserve Bank estimates that the largest price declines of the last year were in rubber, which fell 53.5 per cent; in corn, which fell 52.7; in sugar, which fell 54.5; oats which declined 57.4; coke, 55.6; silks, 63.5; and potatoes, 71.7.

The Michigan Agricultural College is sending out warnings against using certain widely advertised stock tonics. Complete information can be procured from the extension division of the college.

Extensive new port works are planned for Rio de Janeiro and bids are being asked. Specifications have been forwarded to the United States Bureau of Foreign and Domestic Commerce where they may be examined.

Canals play an important part in the life of France. About half the interprovince commerce is carried by water.

London reports the amalgamation of British dye manufacturers.

The Philippines imported 687 tractors in 1919, against five in 1918.

In making its annual report to Congress the Federal Trade Commission urges the establishment of central markets for perishable foods and a system of Federal licensing for dealers using such markets.

Dr. R. S. MacElwee, director of the Bureau of Foreign and Domestic Commerce, declares that there is a growing interest in foreign commerce. American firms, he says, are beginning to believe that foreign business is excellent insurance against domestic depression.

The army is making a series of tests of motorized equipment at Fort Snelling. The tests will continue for several months.

The Bureau of Standards is experimenting with colorless waterproof compounds applied to Indiana limestone.

Members of the Clothing Manufacturers Association of Boston have voted to put their plants on a piece-work basis with a rate scale which amounts to a reduction of 22 and one-half per cent.

Reports from California are to the effect that some ranch owners are experimenting in the feeding of peanut shucks to cattle. The shucks are mixed with cottonseed meal.

The New York Central has been granted a loan of $26,775,000 by the Interstate Commerce Commission.

Authorities of Purdue University declare that the old-fashioned farmer who used to plant his crops only in certain phases of the moon is rapidly disappearing.

Australia's exports to the United States now exceed those to any other country except Great Britain.

Railroads Broke Records in 1920

Nineteen hundred and twenty was a record year for American railroads. They not only moved a larger tonnage than in any previous year, but achieved other results equally noteworthy.

Since the roads were turned back to their owners on March 1, the following results have been accomplished:

Increased the average movement per freight car per day 6.3 miles—from 22.3 to 28.6 miles.

Increased the average load per car 1.7 tons—from 28.3 to 30 tons.

Made substantial reduction in the number of unserviceable locomotives.

Reduced the accumulation of loaded but unmoved freight cars from 103,237 on March 1, to 21,991 on December 3, of which only 6,386 were detained because of the inability of the railroads to move them.

Relocated approximately 180,000 box cars from the East to the West for the movement of farm produce.

Relocated approximately 180,000 open top cars from the West to the East to keep up the production of coal.

Moved the third highest coal production in the history of the country.

Spent more than $500,000,000 extra on improving the maintenance of tracks, bridges, cars and locomotives.

Contracted to spend about $250,000,000, largely out of earnings, for additions and betterments to promote the movement of cars.

Made arrangements to purchase approximately 50,000 new freight cars, 1,500 new locomotives, and 1,000 new passenger cars.

Began the reconstruction of thousands of oil cars.

Moved—with a deteriorated plant, under disturbed labor and business conditions—the largest volume of traffic ever known in a single year, with the highest efficiency yet achieved, and with a minimum addition to the value of the property on which the public has to pay a return through rates.

An effort to form a pool of tobacco growers has failed in Kentucky. The reason given is the failure to arouse sufficient interest among the farmers to make the venture a success.

George H. Cushing, managing director of the American Wholesale Coal Association, informed the Senate committee investigating the price of coal that government officials took advantage of their knowledge of conditions to form a pool of 450,000 tons on which they made a profit of $750,000. He did not name the officials at the open hearing.

Michigan farmers will maintain representatives at the state capital during the legislative session.

British chemists claim to have discovered a method by which clay can be used in the place of fats in the manufacture of soap.

The number of farms in Missouri decreased 27 per cent between 1900 and 1910, and 5.1 per cent between 1910 and 1920. Consolidation of farms is said to have been responsible for much of the numerical loss.

The Shipping Board has rejected bids on bunker coal because it believes the prices quoted are higher than conditions justify.

Switzerland has replaced 50 steam locomotives with electric engines.

More than 30,000 automobiles and trucks are employed by the various departments of state governments.

The high price of coal is said to have done a great deal to stimulate the development of water power in Maine.

Court dockets in New York are said to be jammed with cases arising out of the cancellation of orders which became general with price reductions.

The Farmers' National Council and the National Board of Farm Organizations have protested the passage in Congress of the anti-strike bill.

The governor of the Federal Reserve Board reports that the farmers of the United States have almost two billions in bank credits. The estimated figures by districts follow: Boston, $4,979,000; Philadelphia, $3,580,000; Cleveland, $1,753,000; Richmond, $325,000,000; Atlanta, $230,000,000; Chicago, $128,408,000; St. Louis, 1920, $665,000,000; Minneapolis, $225,000,000; Kansas City, $229,432,000; Dallas, $44,911,000; San Francisco, $89,000,000.

American firms in China have opened a campaign to induce Congress to relieve them of the payment of an income tax.

The shortage of freight cars which hampered industry during 1920 has been replaced by a surplus.

Salmon canners are considering reducing their pack this year. They have decided that a nation-wide selling campaign will be necessary if they are to dispose of their 1920 pack.

The packers have asked the government for more time in which to dispose of their stockyard holdings.

Mexico has increased the duty on raw cotton from eight to 12 centavos.

The University of Idaho has been so impressed with the need for instruction in the care and operation of tractors that it is providing a course for farmers.

Many fishermen are reported to have left the Newfoundland banks because of the low prices received for their catches.

Banks and state officials have asked the farmers of North Dakota to market 10 per cent of their products each month in order to relieve the strain on rural banks carrying a line of credits.

The Spanish Government has advertised for bids on a contract for 3,500 freight cars.

Briefly Told

"Bulldogging," or the roping and throwing of steers, and wild horse racing are forbidden in the wild west rodeo exhibition to be put on in Spokane next July.

The great English novelist, Charles Dickens, is a favorite in Russia. Both "The Cricket on the Hearth" and "A Christmas Carol" have been dramatized there.

American products are being advertised in the theaters of India by means of motion picture films. Views of road-making machinery at work prove to be especially interesting to the natives.

Los Angeles is building a hotel where it will be possible to feed four thousand persons at one time.

Forty-four per cent of the net cost of the war, excluding foreign loans, has been paid to date.

To buy bread flour for the starving populace of Vienna the authorities are pawning a collection of the most valuable tapestries in the world.

A Federal prohibition agent of Seattle reports that after two years' search a still was found which was underground and could only be approached by going through a hollow log, the entrance of which was concealed by stumps and briars. Water was piped from a spring to a room 10 by 14 feet, from which a sewer led to the river.

The military taxation of Switzerland exceeds $4.50 for every man, woman and child of the little nation.

An American botanist, after years of experimenting, has succeeded in growing colored cotton. Light brown, dark brown, light green and dark green are the four colors so far produced. The botanist is now working to produce black cotton from seed.

At the headwaters of the East and West Rosebud rivers in the Beartooth mountains of Montana is a glacier known as "Grasshopper Glacier" from the fact that there are thousands of grasshoppers imbedded in the perpetual ice in as perfect a manner as if preserved in alcohol for exhibition. Scientists believe the insects were caught in the storms in attempting to cross the mountain range.

George Washington's shaving outfit in a morocco case was recently sold for $950.

According to the biological survey of the United States Department of Agriculture there are seven million hunters in this country.

It is estimated that at least ten thousand automobile parties could be taken care of in the beautiful section of the Yellowstone National Park desired by irrigationists.

Bandits have robbed Francisco Villa of 200 head of horses. Villa is indignant and asks protection from marauding bands.

In Andean Colombia there are no fewer than 1,150 species of land birds, which are non-migratory because of the fact that in this part of the Andes the birds enjoy tropical, sub-tropical, temperate and alpine zones.

The largest touring car in the world is owned by King Albert, of Belgium. It is in two sections and accommodates fifteen persons with sleeping quarters for 10. The machine was designed for hunting in Africa and is equipped with kitchen, bath and dining room.

Among the heirlooms recently discovered of a French family in Auteuil, France, is a ring which was once worn by Queen Elizabeth, of England. It had been presented by an English nobleman three generations ago to an ancestor of its present owners.

England is planning to harness the ocean tides for water power.

The Chinese claim that certain of their Buddhist priests explored the coast of Mexico, visited the Aztec empire and crossed into Alaska one thousand years before the Spanish invasion.

Nearly half the traffic between the French provinces is carried on by water instead of by rail. The cost of water traffic is less than half that by rail.

The 1920 expense of both Army and Navy was $2,347,000,000.

Buenos Aires is the largest Spanish-speaking city in the world.

A former soldier, a member of the A. E. F., of Chattanooga, coughed up a bullet which had been fired into his lung in an engagement in the Argonne. Army physicians feared an operation would be fatal and had refused to remove it.

Dye from a mask worn at a ball entered through an abrasion on the nose of a young girl of Newark, New Jersey, recently, with the result that blood poisoning developed and total blindness followed.

Pittsburgh will plant sixteen hundred yellow tulips next spring near Neptune Fountain in Schenley Park in the form of two large gold stars, in memory of Pittsburgh soldiers who fought and fell in the World War.

The Asiatic buffalo is a very valuable animal, its milk containing three and a half times as much butter fat as that of the cow.

As a protest against the display of luxury in times of stress and misery an old gentleman, well-dressed and of distinguished appearance, smashed the window of one of the most fashionable jewelry stores in Paris recently.

Despite the fact that he has inherited $60,000 through the death of an uncle, a seaman on the United States destroyer Wadsworth says he will "stick to the Navy."

October 31, 1920, has been designated by the Italian Government as the official date of the war's close.

Frozen remains of a mammoth, now extinct, have been found in Siberia. The animal was preserved so well that dogs readily ate the flesh.

The X-ray is used in airplane construction to detect defective materials, weak metal castings and workmanship, which would otherwise escape the eyes of an inspector.

A curious grass in Cuba bristles with tiny sharp-pointed spikelets which impale multitudes of insects, the wings of the victims being pierced and entangled by the barbed spines causing them to perish miserably.

In Salt Lake City is a $40,000 monument built in honor of sea gulls. When Mormons first settled in Utah the sea gulls destroyed the locusts which endangered the crops and the monument was erected in their memory.

Uncle Joe Cannon has been nominated for a seat in the House twenty-five times and elected twenty-three times, the longest service in Congress on record.

Many old frontier saloons in the West are being donated and re-built into parsonages and churches.

There are thousands of child narcotic addicts in New York according to the New York State Narcotic Control Commission. Where the parents are addicts the children living with them are almost sure to be addicts, too.

During the past year 8,500,000 acres of forest land in the United States were burned over by 27,000 reported fires.

A rooster crowing near the transmitter of a wireless telephone in Rock Island, Illinois, awoke the wife of the man on the receiving end of the telephone in Dallas, Texas.

As a result of recent earthquakes in Chile, large mountains in the Andes range sank an average of 160 feet, a sufficient distance to disclose peaks beyond that had been hidden from sight. High banked rivers which flowed swiftly are now flush with the banks and moving slowly.

To socialize Berlin's housing and servant problem, the municipal government plans to tax empty rooms and multiple servants. The tax will be graded according to the number of rooms and servants.

One hundred thousand of the 1,250,000 deaths occurring in the United States annually could easily be prevented by the application of available medical knowledge.

A five-dollar bill advertised as found by the Berkeley, California, police department was claimed by 236 persons.

Great Honor; Limited Powers

Calvin Coolidge, the vice president-elect, has this to say of his new job; real influence can be exercised under favorable conditions.

The Sunday Blues

The proposed revival of the Blue Laws of the days of the Puritans has led to considerable discussion and a wide difference of opinion.

Hunting America's Last Bears

Down in the cane-brakes of Louisiana are thousands of bears and into these wilds came a party of hunters. This story is of their trip.

Lord "Bob"—England's Political Hamlet

Robert Cecil occupies a unique position in English politics, and some whisper that the day is not far distant when he will take the premiership now held by Lloyd George. This intimate study of the man by an American correspondent who has been in the center of European activities will well repay the time given to it.

Taft Once Tried to Resist Jews—and Failed

As President he attempted to defeat a Jewish plan against United States foreign relations, but as the story goes, the Jews tamed him to docility in their service—as witness his recent unprepared denunciation of the articles which have appeared in The Dearborn Independent's series, *"The International Jew."*

America's Most Progressive School District?

This is the claim made for the community in which is located the Chaffey Junior College where the three R's have been discarded and the time of the students is occupied with the practical things that go to make up the life of the modern agriculturist. It is what the parents want their sons to learn, and the sons seem to like it!

Many Men of Many Minds

Floyd W. Parsons.—War is always a curse and a waster, but at the same time it is a stimulator of thought and invention. The economic, political and industrial character of the world practically has been remade during the past thirty-six months.

Thomas A. Edison.—Every man has some forte, something he can do better than he can do anything else. Many men, however, never find the job they are best fitted for. And often this is because they do not *think* enough. Too many men drift laxily into any job, suited or unsuited for them; and when they don't get along well they blame everybody and everything except themselves.

John D. Rockefeller, Jr.—Modern thought is placing less emphasis on material considerations. It is recognizing that the basis of national progress, whether industrial or social, is the health, efficiency and spiritual development of the people.

Thomas W. Lamont.—The Japanese and the Chinese are a bit more discerning, I believe, than most races and they quickly detect the spurious article. Never will American trade and prestige reach their place in the Orient until we have picked out as our representatives men of the highest character—men who, in thought and in action, show themselves to be typical of the best that there is in American generosity of spirit, of courage and of kindness.

Frank Gillmore.—The world is livable enough today. To many of us, it is more than livable, it is indeed joyous to those who can appreciate the wonderful and the beautiful and both the wonderful and the beautiful are always near at hand to those who have eyes to see and just a little understanding.

W. L. George.—Every boy knows that nothing need stop him, that no class bar will cut him off from any position or any office. He knows that in the West of his country lies land which has never been trodden by a white foot. Therefore, there are resources which he can take, and, being a normal human being, he tries to secure his share. In other words, he is born a pioneer. I do not want to exaggerate; many millions of Americans are perfectly content to go indefinitely in the occupation they have drifted into, and seek only more wages, or more salary, but the thing that matters is the consciousness in the American mind that everything is open and everything is possible.

No Class Bar in America, Points Out W. L. George

Estella M. Place.—The ideal home is a miniature democracy in which each member has a voice in the management, but in which independence of action is encouraged so long as the best interests of the family are conserved.

Frank E. Frothingham.—There is no irrigation or water power need sufficiently pressing to justify encroachment upon the comparatively small areas of natural wonderland which we have set aside as national parks.

Dr. S. A. Sochocky.—Locked up in radium is the greatest force the world knows. An ounce of it, if carried in the hip pocket in an ordinary glass tube, would kill a man in ten hours by destroying his tissues and bones.

Lord Northcliffe.—If the League of Nations or any other association of nations, including the United States, can join effectively in forming a buttress in the world against evil, I think I have sufficient knowledge of public opinion to say that Great Britain would welcome it.

Herbert N. Casson.—Unless you are loyal to others, no one will be loyal to you. No success—no lasting success—can come to any firm unless there is loyalty on both sides.

Joseph Knowles.—The moment you have left the haunts of man, the high cost of living and all other such artificial problems vanish. We have gone stale by living within brick walls and by depending on steam heat and push buttons. Our woodcraft instincts have atrophied through lack of use.

Rep. Harold Knutson.—A short time ago I visited Ellis Island to see for myself the class of immigrants now coming here; and to say that I was appalled by the class we are now getting is stating it mildly. Two other members of Congress accompanied me, and we were agreed that only a very small percentage could be assimilated without lowering our present standard, and that is something we must guard against.

A. C. Bedford.—Europe does not need American money so much as she needs American management.

Franklin H. Giddings.—The public has a moral right to know the geographical extent of a coal mining corporation's real estate, what its actual capital is, what its actual debts are, what actual payments of wages it makes, and how they are graded, how many days a year each class of employes is productively occupied, the sanitary state of the communities in which the employes live, what taxes the corporation pays, what percentage of its income is paid out in salaries, how it keeps its accounts, and what its profits are. A coal mining corporation that objects to letting the public have this information should be put out of business, and the public would have no occasion to worry lest there should be no coal to burn if it were.

Public Should Have Facts Concerning Coal Businesses

Edward Alsworth Ross.—It is safe to predict that fewer votes will be corruptly swayed and that they will never again be sold at such bargain prices as in the days when no limit was imposed on the rôle of liquor in politics.

Colonel Guy D. Goff.—It is education which is needed. We cannot save the world by hanging murderers and imprisoning thieves. We can save it only by teaching mankind not to murder and that theft is of all roads to wealth the most precarious.

William T. Hornaday.—In all probability there is not an acre of ground, a tree six inches or more in diameter, or a barrel of water, in any national park in the United States, that is not wanted by some industrial concern that can make out a list of most plausible and good reasons why they should have it.

Fred C. Kelly.—In the long run, you can kid a man out of more money than you can tax him out of. Tax it away from him and he becomes soured and disgruntled—almost a foe to his government; but keep telling him what a great philanthropist he is, thus getting him to loosen up, and he is not only pleased with himself, but with nearly everybody else.

James Montgomery Flagg.—Philosophy has its place—at the very end. When you have achieved permanent tonsillitis from blasphemy then take to philosophy. Philosophy is an anesthetic: when life gets a bit too thick then one saturates a wad of cotton batting with philosophy and holds it to one's nose and inhales.

Charles Moreau Harger.—The gathering of producers into granges, unions and societies has reached vast proportions. They have their special publications, which set forth the profits possible if they can act as a unit. The dream of complete control of products of field, orchard and ranch is most attractive, but it demands an organization of more compactness and capital than has yet been evolved, to control a nation's products.

Compact Organization Necessary for Control of Foods

Lee Russell.—Teachers know the worth of their calling; they would like more evidence that the public really feels that worth. They know that on them, more than on any other one class of citizens, depends the future of the republic, but they are somewhat lonesome in the consciousness of that knowledge.

William Hood.—Most of the big things I have seen done have been accomplished by faithful, intelligent, and painstaking effort rather than by special brilliancy. "Strokes of genius" are more likely to be apoplectic than apocalyptic.

William S. Benson.—Our merchant marine was built to meet a world emergency. It is equipped to promote world's peace.

Mary H. Ingham.—The brightest vision shines in the New Year. With ballot in hand, women are setting forth to find the way to draw together the nations of the world by the solidarity of their understanding of the needs of all women and all children. This internationalism holds no threat of destruction but only the highest hope of civilized humanity.

Joseph T. Dickman.—I do not believe the time is ripe for universal military training, and feel sure that the people are against it. While there is necessity of a standing army of approximately 200,000 men, it is evident that a more economical program for maintenance of this army will be necessary if the country's nose is to be once more brought above the water in matters of finance.

David Lloyd George.—When we talk about emigration we are not talking of bleeding this old country. Quite the reverse. We are adding to its strength. Whether they are in Scotland, England, Wales, Canada, Australia or New Zealand, there is a great sense of kinship, a great feeling that we are one people—one people and one country.

Katherine De Witt.—This would be a more livable world if we could banish envy and jealously from our hearts, our lives, our homes, our business, our social work, our philanthropies.

Rep. James T. Begg.—The United States never developed from the raw country that she was, from the day of the wax candle and the tallow dip down to the electric light by doing for the citizen what he ought to do for himself. We have run wild in asking the government to do this, to do that, and to do the other thing.

Corinne Lowe.—The Polish Jew, like the Italian, is not going to do much toward the solution of the farm-labor problem in this country. He is going to settle in the cities. The immigrant from this section, exposed as he has been for years to unsettled conditions of life—to war, disease, hunger and cold—represents a low ebb in physical vitality. He is, generally speaking, the most underfed, the most poorly clothed and the most wretched in appearance of all the present-day arrivals at Ellis Island. Second, his refusal to focus upon any save urban centers creates, particularly in the already congested East Side, an acute phase of the housing problem.

Polish Jew No Aid to Farm-labor Problem of Nation

Judge Benjamin B. Lindsey.—As I see it, the hope of the state—of all states—is still in education, beginning with itself in its own beginning, childhood.

J. W. Johnston.—When a man's in trouble he is glad to be assured of something reasonable. All have had mothers and, no matter how low these men have sunk, all have loved them. There has never been a time when you couldn't bring tears to their eyes by referring to their mothers. What is that? That is Love. That is God.

William H. Edwards.—It is an asset to every business man, and particularly to every man in public life, to be able to get the crowd interested in him, in his personality, his work.

Calvin Coolidge.—It may be well for all of us to realize that the government of the United States was organized for justice to all and that each should have an influence in its control.

George P. Brett.—To stack hay on a sunny day in June, or to hasten its loading before a sudden thundershower, will give your muscles just as much exercise; and the glow and contentment which come with your cold shower before dinner, after a day spent at work in the fields, are finer, and give more satisfaction, than any game ever invented by man.

Governor Ben W. Olcott.—Our governmental principles are founded on too firm a foundation even to be shaken by any of the winds which may now be swirling about.

Hunting America's Last Bears

By ROBERT MORGAN

OUTSIDE the great national parks of the West, the icebound plains of the Far North, and the mountain fastnesses of Kadiak Island, there are few big game animals left in the United States, and a bear hunt, whether it be after the big grizzlies of the famous Alaskan Island, or the smaller bears which once frequented what is now the United States, from the Atlantic to the Pacific and from the Great Lakes to the Gulf, is an unusual sporting event. Yet, during one of the last weeks of 1920 a bear hunt was held less than 100 miles from an American city of 400,000 inhabitants, on which five bears, ranging from 200 to 400 pounds, were killed, seven others seen, and the tracks of more than 30, aside from those killed by the hunters, noted.

Twenty-two hunters, five 'Cadien guides, and 33 hounds took part in the hunt, not to mention five or six southern darkies, taken along to attend to the cooking and other necessities of the hunters. It was the largest and most productive bear hunt held in the United States since 1917, when a chase productive of seven bears was held through the same section of the country, only a few miles from the hunting ground selected this year. This year's hunt took place over some 40 square miles of the Louisiana Marsh, that vast tract of tide-level lands lying along the Gulf of Mexico shore of the Pelican State, just west of the Atchafalaya River, and back of Vermillion Bay. It was given by Edward Avery McIlhenny, of Avery Island, Louisiana, who, by the way, killed the largest black bear ever taken in Louisiana, in 1916, near where this 1920 hunt was held. This big fellow was seven feet, seven and one-half inches and weighed 671 pounds.

Among the guests on the hunt were Paul J. Rainey, of Cotton Plant, Mississippi, whose African hunting exploits are historic among big game hunters, and who made the first motion pictures of the African big game in its haunts. Mr. Rainey arrived at the McIlhenny home on Avery Island with 23 dogs, ranging from the big fox hounds, Barrister, Lead, Jim and Ring, through other trailing hounds to Airedales for fighting a cornered bear, down to little Diamond, a dog of no particular breed, but a fighter of parts, game to the heart and destined to be the hero of the hunt. Among other well-known hunters called from distant parts of the country by Mr. McIlhenny were W. T. ("Bill") Young, of Nashville, Tennessee, who had just returned from a two-year jaunt after mountain sheep in the Selkirks and the coastal mountains of Alaska; Lou Kimmerer, who has been hunting wolves around his home in Paris, Texas, until he has virtually cleaned the county of these enemies to the stockmen; James Lord, of Hermansville, Minnesota, whose moose and caribou hunting has carried him close to the Arctic Circle, and Tom McHenry, of Macon, Mississippi, one of the best known fox hunters in the South. The balance of the party consisted of men who have hunted occasionally in various parts of the world, like the writer.

Top—The first bear, weight, 300 pounds. Paul J. Rainey, big game hunter recently home from Africa, kneeling with hands clasped. Bottom, left—The saddest one of all—a deer dog left out of the bear hunt because he might teach the bear dogs to run deer. Right—The dog boat, crossing Vermillion Bay.

At five o'clock on the morning selected for the start from the McIlhenny "backyard," which consists of 40,000 acres of lowland, swamp and marsh, with 20,000 more under cultivation in the "front yard," the Rainey dogs, with their keepers, were loaded into an old converted luggar, and sent "chugging" away down a bayou into the heart of the marsh, while the hunters piled into a large motor boat and followed slowly after. The McIlhenny dogs, eight or ten in number, were sent overland in charge of three or four darkies, to meet us at the camp which was to be our headquarters for a week.

The run down the bayou to Vermillion Bay, across that shallow but treacherous arm of the Gulf of Mexico, and thence five or six miles up another bayou, into the midst of a tract of jungle which seemed thousands of miles from any human being, required the time until noon, but showed us the great marsh and all its teeming life awakening for another day. Myriads of ducks rose before the boats, long wedges of geese passed high overhead; raccoons peered at us from clumps of wild rice and, as we passed up the second bayou, we saw tracks frequently showing where bear and deer had come down to the water, either to drink or to swim across.

The camp proved to be a commodious houseboat, which Mr. McIlhenny had had towed out from his plantation, and which accommodated all of us, provided we ate at the big table erected outside on the top of the high levee which here walled in the canal. A shelter provided for the ducks, while "Jones, the original ace of spades, prepared luncheon of ham, mallard ducks, sweet potatoes, corn, hot bread, jam and coffee. We struck out immediately into the swamp, but, not knowing the country well, caught no bear, though the dogs struck one hot trail on which the famous Barrister of the Rainey pack ran nearly all night, finally leaving it, when no one came to his help, and returned to a trapper's camp, where he was tied and brought to our camp in the morning.

The swamp here consists, first, of soft ground, about a foot above water level, overgrown with underbrush, clumps of palmettos, small live oaks, and tall cypresses, mostly dead, remnants of a heavier forest which has been killed by many years of battle with the salt water of the tides. There are no paths through this swamp, and the ground is studded with "cypress knees"—bent and gnarled roots and shoots of the cypress, rising six inches to a foot from the ground and furnishing constant stumblingblocks as the hunter fights his way through the jungle. Back of the swamp, of course, is higher land, rising gradually to the level country of the "sugar bowl" and "rice pocket" of Louisiana. Toward the Gulf the swamp becomes marsh; that is to say, the land lowers, the shrubbery, palmettos and trees disappear, and the whole quaking bog is covered with a growth of so-called "wild rice" from four to ten feet in height. Throughout both swamp and marsh are found numerous small pools and bayous, apparently full of water, but really filled to a depth of three or four feet with black, sticky mud, and then four or five inches of water on top. All in all, it is the hardest going for both men and dogs, according to Mr. Rainey, Mr. Young, Mr. Lord and other of the experienced hunters, of any part of the hunting grounds of the United States.

The second day of the hunt was spent, likewise, in getting acquainted with the country. On the third day, the party following the dogs struck the first bear. Rainey, Lord, Young and McHenry, with young Louis Stoner, were following the trailing hounds, with W. L. Callicut and Willie Miller some hundred yards behind, with the fighting dogs, coupled two together. Barrister and Jim hit the trail at the same time, apparently rousing the bear from a snooze beneath a clump of palmettos. They ran him for half a mile down this particular peninsula of swamp between two bayous, when Bruin attempted to turn and cross one of the bayous, but, coming up behind one of the men on stand, got the man-scent and turned again into the jungle. Twice the dogs ran him up and down the tongue of swamp, and then the hunters, by cutting across, released the fighting dogs and the entire pack caught up with the bear.

He ran about 200 yards farther, slipping through the underbrush at a speed almost equal to that of a deer, a gait which called forth every effort of the hounds to keep up. Then, two of the Airedales got in so close that they began nipping at his hind legs, when the bear sat up at the foot of a large dead cypress stump and began to fight for his life. Little Diamond, the "full-blooded 'dog'," as Rainey described him, rushed in and leaped at the bear's nose, but the hunted animal caught the dog with a full forearm swing on one hip, tearing open the flesh and knocking the dog like some huge white ball of snow, clear over the top of a palmetto some four or five feet high.

"Goodby, Diamond," shouted Rainey as he prepared to shoot the bear, but Willie Miller, Rainey's master of hounds, rushing round the palmetto, found his little pet in the midst of a pool about ten feet wide, filled with mud with a little water on the surface. Despite the blow and the long driving fall, Diamond had lit, like the far-flung sinker on the end of a fisherman's long line, in the midst of this pocket of soft mud, and it had broken his fall so completely that, save for the cuts on his hip, he was unhurt. Pulled out by Miller, the brave little dog tried again and again to get at the bear, which received eight bullets from the hunters before he finally toppled over, dead. He weighed 300 pounds. That was all the bear for that day, but on the next, Luis Charbot, a 60-year-old "boy" who traps for a living and had his camp about a hundred yards from ours, while going the round of his traps, met a bear, rounding a palmetto clump, face to face. The bear had been routed out by the noise of the hounds running another bear, and was trying to get out of the swamp without any noise.

"Dat b'ar, he were so close dat I dursn't shoot, for de fear dat ef Ah mees heem, he claw me," said Charbot, "so Ah back off an' Ah back off onteel Ah get ten oh feefteen feet from heem. Dat b'ar, he jus' stan' an' look me hup an' down, lak he know me. An' den Ah keel him, queeck, at one shot, dat's all."

The following day, Tom McHenry and Mr. McIlhenny added two bears—one each—to the score, killing them as they ran ahead of the dogs, without either bear having the opportunity to fight. On the next day John Riggs, one of the guides, shot another which had been routed out by the hounds following another bear. Heavy rains then drove the hunters home without a chance at the dozens of other bears still remaining in the swamps. More than 30 separate trails were reported by the hunters, all of bears which the hounds were not chasing, but which, hearing the hounds after other bears, were trying to get out of the swamp. On several occasions, bear were heard going through the brush

(Concluded on page 10)

Largest Louisiana Bear on Record Killed in 1916.

THE largest black bear ever killed in Louisiana, as far as there are any official records, was shot by Edward A. McIlhenny, on Avery Island, November 21, 1916. This bear weighed 671 pounds, and its measurements, as preserved by Mr. McIlhenny, were as follows:

Length, pad of hind foot to tip of nose, 9 ft. 2½ in.

Length, nose to root of tail, 7 ft. 7½ in. Girth, 4ft. 9¾ in.; neck, 2 ft. 5 in.; forearm, 17½ in.; fore-paw, 14 in.; hind leg, at joint of femur and tibia, 30 in.; head, 32¾ in.

For comparison, it may be said that the largest bear killed in the neighborhood of Avery Island in 1920 weighed approximately 400 pounds, and that this is considered a large bear of this variety, but signs of much larger bear were seen.

Too Much Haste

THE action of Congress in passing the bill re-creating the War Finance Corporation is not meeting with the spontaneous applause which the national legislators may have expected would greet their action in over-riding the President's veto. The press of the country appears in the main to disapprove of the measure and to feel that Congress has been very hasty.

Undoubtedly Congress felt that it must satisfy the demands of the farming interests of the country. The session was no sooner under way than Congressmen and Senators were bombarded by requests to "do something" to save the farmers who, after raising tremendous crops, saw their profits and a share of their investment slipping away because of the tumble taken in the price of foodstuffs. But the question is whether in reviving the War Finance Corporation, Congress did the right thing.

As Mr. Wilson stated, the corporation was only a temporary plan in the beginning, a kind of a pontoon bridge that would enable us to surmount conditions now happily a thing of the past. Furthermore, it was dismantled because it had outlived its usefulness and turned back something like $400,000,000 to the Treasury because of the belief that to continue government loans would be a doubtful, not to say risky policy.

If we now prepare to finance more foreign trade we will not only be planning operations which the Brussels conference of European bankers has declared to be unwise, but we will be shifting to the shoulders of the government a task which should and would, if we left matters alone, be borne by private capital.

There is a question as to whether the public realizes that the War Finance Corporation must make drafts upon the national Treasury to operate. It has the power to draw upward of one billion dollars, and to honor the requests and provide the funds the Treasury must sell bonds or call for an appropriation. In either case the money must come from the people and with the demand for it will go all hopes of a retrenchment in government expenditures and a reduction of taxes.

Generally speaking the reports received in Washington from American consular agents indicate that Europe is recovering much more rapidly than has been expected. The import trade of Germany, France, Great Britain and Belgium in 1920 shows increases over 1919 which run from 150 to 1,000 per cent. Reading these figures naturally brings up the question of whether natural laws would not have sufficed in this case if we had been possessed of a bit more patience.

Goring the Government's Ox

NOW that Congress has discovered that the coal operators have not been content to overcharge the public but have been fleecing the government also, perhaps there will be some action taken toward fixing the price of coal.

It has been no secret that the public has been paying excessive prices for coal. Even when the full extent of the practice was revealed it did not create any great excitement in government circles. But when the Senate committee stumbled across the fact that the coal operators had been overcharging the government 200 per cent, a loud cry was made for the Department of Justice to begin prosecution.

While the Senate is considering the enormity of this offense let it be hoped that it will give a thought to the following problem:

If the coal operators made a profit of 200 per cent on coal which was sold to the government at $9.25 a ton, how much profit was there in the same kind of coal when sold to the private consumer for $16 a ton?

The operators have piled up enormous profits during the war and post-war years and there is probably no way of taking the unearned portion of their gains away from them, but there are other years coming and the public will probably be willing to forget government oversight in the past if an adequate measure of protection is afforded in the future.

Everybody will agree to Senator Kenyon's suggestion that the coal mines should be regulated just as the railroads are. But why not do it instead of merely talking about it?

Renewing Resolutions

"WELL," said the man who had been listening to many after-dinner speeches on tariff reforms and other political subjects, "in my opinion what we need in this country is more initiative and less referendum."

More initiative and less referendum! If that isn't hitting the nail on the head and spotting just the trouble with the average human being, what can come nearer?

More initiative and less referendum!

About this time each year, people begin to weaken in the continuation of their new year's resolutions—and when they begin to weaken they are about ready to fall. What they need most at this time is *initiative*, more determination to carry through their decisions and strengthen themselves so that new resolutions made next year, or earlier, can be carried out with greater ease.

It requires but little initiative to form a set of good resolutions, but it takes a lot of push and persistence and continuation of that initiative to keep and follow up even a fair to middling grade of resolutions. Referendum to recall our pledges that we shall make none but good marks on the clean page we reached when we turned over a new leaf, is easily summoned—and the initiative then has to be mustered in full force to keep from breaking in on the strength that was lent us when we thought of the coming fresh, unstained pages on the new calendar.

Yes, resolutions are more easy to make than to keep. Initiative and determination are vastly more difficult to continue than referendum and vacillation. Breaking the good resolutions—"just for this once"—is much easier than sticking to them without any slipping from the path we have laid out for our feet to follow through the new year.

This is a good time to renew the new year's vows. Better renew them now, and it will help to put aside thoughts of referendum and vacillation. Might even add the one or two that you forgot to include when making up the list during the bustle and rush of the holidays.

The Uncertain Trumpet

DE VALERA has returned to Ireland and he must have taken with him a sense of having failed in his mission in the United States. He got sympathy and some cash but he did not succeed in enlisting the support of the government in his plans for the creation of an Irish republic.

That, of course, was the principal purpose of De Valera in coming here and of his compatriots in sending him. It was, without doubt, their big card. It was boldly played but like many big cards, it failed to accomplish results commensurate with its importance.

There is a doubt even as to whether De Valera's visit materially advanced Ireland's cause in the United States. Most certainly it did not stir up any waves of public opinion sufficiently strong to induce Congress to interfere between Great Britain and Ireland. It did indeed bring forth a sort of indorsement of Ireland's cause from the Senate, but it was distinctly the kind of an expression of friendship for Erin which was not unfriendly toward Britain.

De Valera himself did not prove to be the outstanding figure that had been expected. Perhaps the contrast between the hardships shared by the leader of our own struggle for independence and the way in which the president of the Irish republic took his ease in a New York hotel may have had something to do with it.

Perhaps it was a subconscious feeling that our uninvited visitor was not as devoid of guile as might be wished. But whatever the cause, De Valera could not strike within us the magnetic chord which might have fired our imaginations and aroused our sympathies.

If Mr. De Valera has the patience to search for the reason for his failure, let him read I. Corinthians, Chapter 14, eighth verse:

> "For if the trumpet give an uncertain sound,
> who shall prepare himself for the battle?"

The Reduction of Armaments

ONE danger that the movement to have the United States sponsor a proposal for the reduction of armaments will fail of accomplishment is that there appears to be an overly large number of cooks attending to this particular broth.

There are several plans in evidence and as many more suggestions, all from men who stand in the position of national leaders. Not more than one of these suggestions, or at the most a combination of two, can be adopted. If this is done, well and good, but if we are to be treated to another such spectacle as that attending the discussion of the Covenant of the League of Nations, when personalities weighed more heavily than principles, the movement will evaporate in talk.

For the sake of the nation and the world at large it is to be sincerely hoped that the method of reducing armaments will not occupy the attention of Congress to such an extent that no thought will be left for accomplishment. There must be less discussion about how it is to be done and more haste in doing it than is usual or the whole affair will be snarled up in a tangle of international and domestic policies.

It is probable that the fewer nations consulted the better. Something has been said about the desirability of showing Continental powers the courtesy of inviting them to become a party to and to assist in framing the agreement. But on second thought such a course seems neither desirable nor necessary. The experience which America has had with the Continental powers leads to the belief that they will not be content with a straight business proposition but will want to tie on a series of provisos in the shape of mandates or commercial privileges. The less horse trading that is done in this matter, the simpler the dealings are, the better the chance of the pact standing the tests to which it will certainly be put.

If the United States, Great Britain and Japan come to a common understanding, the rest of the world can be counted on to fall in line, for the present at least, and it seems the height of absurdity to feel that we must jeopardize the possibilities of an easy agreement for the sake of empty politeness. Certainly these nations were influenced by no such sentiment toward the United States when they gathered about the Peace Table to settle the World War.

The Forks in the Road
